TABLE OF CONTENTS

1 GENERAL DESCRIPTION 25

2 FEATURES..... 27

 2.1 M251/M252 Series Features 27

3 PARTS INFORMATION..... 42

 3.1 Package Type..... 42

 3.2 M251/M252 Series Selection Guide 43

 3.2.1 M251 Base Series (M251Fx / M0251Ex / M0251Zx) 43

 3.2.2 M251 Base Series (M251Lx)..... 44

 3.2.3 M251 Base Series (M251Sx)..... 45

 3.2.4 M251 Base Series (M251Kx)..... 46

 3.2.5 M252 USB Series (M252Fx / M0252Ex / M0252Zx) 47

 3.2.6 M252 Base Series (M252Lx)..... 48

 3.2.7 M252 Base Series (M252Sx)..... 49

 3.2.8 M252 Base Series (M252Kx)..... 50

 3.2.9 Naming Rule..... 51

 3.3 M251/M252 Series Feature Comparison Table 52

4 PIN CONFIGURATION..... 53

 4.1 Pin Configuration 53

 4.1.1 M251 Series Pin Diagram..... 53

 4.1.2 M251 Series Function Pin Diagram 59

 4.1.3 M252 Series Pin Diagram..... 94

 4.1.4 M252 Series Function Pin Diagram 100

 4.2 Pin Description 135

 4.2.1 M251 Series Pin Description 135

 4.2.2 M252 Series Pin Description 157

 4.2.3 M251/M252 Series Multi-function Summary Table Sorted by GPIO 178

5 BLOCK DIAGRAM 197

 5.1 M251/M252 Block Diagram..... 197

6 FUNCTIONAL DESCRIPTION 198

 6.1 Arm® Cortex®-M23 Core 198

 6.2 System Manager..... 200

 6.2.1 Overview 200

 6.2.2 System Reset 200

 6.2.3 System Power Distribution 206

 6.2.4 Power Modes and Wake-up Sources 207

 6.2.5 Chip Bus Matrix..... 211

 6.2.6 System Memory Map 211

- 6.2.7 SRAM Memory Organization..... 213
- 6.2.8 IRC Auto Trim 214
- 6.2.9 UART0_TXD/USCIO_DAT0 Modulation with PWM 214
- 6.2.10 Register Map 215
- 6.2.11 Register Description 217
- 6.2.12 System Timer (SysTick)..... 267
- 6.2.13 Nested Vectored Interrupt Controller (NVIC)..... 272
- 6.2.14 System Control Register 293
- 6.3 Clock Controller 302
 - 6.3.1 Overview 302
 - 6.3.2 Clock Generator 304
 - 6.3.3 System Clock and SysTick Clock 305
 - 6.3.4 Peripherals Clock 306
 - 6.3.5 Power-down Mode Clock..... 306
 - 6.3.6 Clock Output 307
 - 6.3.7 USB Clock Source 308
 - 6.3.8 Register Map 309
 - 6.3.9 Register Description 310
- 6.4 Flash Memory Controller (FMC) 345
 - 6.4.1 Overview 345
 - 6.4.2 Features 345
 - 6.4.3 Block Diagram 345
 - 6.4.4 Functional Description..... 347
 - 6.4.5 Register Map 371
 - 6.4.6 Register Description 372
- 6.5 General Purpose I/O (GPIO) 392
 - 6.5.1 Overview 392
 - 6.5.2 Features 392
 - 6.5.3 Block Diagram 393
 - 6.5.4 Basic Configuration 393
 - 6.5.5 Functional Description..... 393
 - 6.5.6 Register Map 398
 - 6.5.7 Register Description 401
- 6.6 PDMA Controller (PDMA)..... 416
 - 6.6.1 Overview 416
 - 6.6.2 Features 416
 - 6.6.3 Block Diagram 416
 - 6.6.4 Basic Configuration 416
 - 6.6.5 Functional Description..... 417
 - 6.6.6 Register Map 423
 - 6.6.7 Register Description 425
- 6.7 Timer Controller (TMR)..... 455

- 6.7.1 Overview 455
- 6.7.2 Features 455
- 6.7.3 Block Diagram 457
- 6.7.4 Basic Configuration 460
- 6.7.5 Timer Functional Description 461
- 6.7.6 PWM Functional Description 467
- 6.7.7 LRegister Map 477
- 6.7.8 Register Description 481
- 6.8 Watchdog Timer (WDT) 511
 - 6.8.1 Overview 511
 - 6.8.2 Features 511
 - 6.8.3 Block Diagram 511
 - 6.8.4 Basic Configuration 511
 - 6.8.5 Functional Description 512
 - 6.8.6 Register Map 515
 - 6.8.7 Register Description 516
- 6.9 Window Watchdog Timer (WWDT) 520
 - 6.9.1 Overview 520
 - 6.9.2 Features 520

1 GENERAL DESCRIPTION

The NuMicro® M251/M252 series is a low-power microcontroller platform based on Arm® Cortex®-M23 core for Armv8-M architecture. It runs up to 48 MHz with 32 ~ 256 Kbytes embedded Flash memory and 8 ~ 32 Kbytes embedded SRAM, 4 Kbytes Flash loader memory (LDRAM) for In-System Programming (ISP). The 32-bit low-power microcontrollers supports wide supply voltage from 1.75V ~ 5.5V and operating temperature range from -40°C ~ +105°C.

Low-power Technology for IoT application

The NuMicro® M251/M252 series behaves low power consumption in Normal Run mode 138µA/MHz at 48MHz, Idle mode 60µA/MHz, Power-down mode 2.5µA (RTC on, RAM retention), Power-down mode 1.5µA (RTC off, RAM retention) and Deep Power-down mode. The NuMicro® M251/M252 series integrates RTC with independent V_{BAT} voltage source pin to support low power mode with main power off and V_{BAT} only. Its low power, wide supply voltage and fast wake-up features make it suitable for battery-powered IoT applications.

Programmable Serial Interface (PSIO)

The NuMicro® M251/M252 series provides up to 8-channel Nuvoton proprietary interface, named as “Programmable Serial I/O” (PSIO), which is capable of generating specific waveform to emulate arbitrary serial communication protocols to connect with specific peripherals by PSIO hardware engine. PSIO can be treated as extension of popular serial communication standard (UART, SPI, I²C, etc.), niche serial communication standard and proprietary protocol (SPI-like protocol for LED-lighting application, etc.). This PSIO hardware engine can simulate comprehensive serial communication protocol with low CPU loading, low control complexity and high timing precision at the same time. High elasticity and flexibility makes PSIO a powerful and useful tool while connecting to diverse peripherals.

Voltage Adjustable Interface (VAI) - Support 2nd I/O voltage without level-shifter

The NuMicro® M251/M252 series integrates Voltage Adjustable Interface (VAI), up to 6 I/O pins to support the 2nd I/O voltage from 1.65V ~ 5.5V to save level shifter components while connecting to external devices. These 6 I/O pins can be configured as UART/SPI/ I²C bus by software setting.

eXecute-Only-Memory (XOM) - Protect the intelligent property of developers

The NuMicro® M251/M252 series provides 1-region programable eXecute-Only-Memory (XOM) to secure critical program code. A tamper detection pin is implemented to avoid malicious damage from hacker. The 96-bit Unique Identification (UID) and 128-bit Unique Customer Identification (UCID) are used to enhance the product security.

Crystal-less USB 2.0 full speed device interface

Part numbers of the M252 series are all based on the M251. It supports a crystal-less USB 2.0 full speed device that can generate precise frequency required by USB protocol without the need of external crystal to reduce the BOM cost and PCB size.

Rich Pheripherals for comprehensive product application scenarios

The NuMicro® M251/M252 series is equipped with plenty of peripherals such as Timers, Watchdog Timers, RTC, PDMA, External Bus Interface (EBI), UART, Universal Serial Control Interface (USCI), QSPI, SPI/ I²S, I2C, ISO-7816-3, GPIOs, up to 24 channels of PWM, makes it highly suitable for connecting comprehensive external modules and LED lighting control. The NuMicro® M251/M252 series integrates high performance analog front-end circuit blocks, such as 16 channels of 12-bit 880 kSPS ADC, 12-bit 1 MSPS DAC, analog comparator, operational amplifier, temperature sensor, low voltage reset (LVR) and brown-out detector (BOD) to enhance product performance, reduce external components and form factor simultaneously.

The NuMicro® M251/M252 series provides 28 product types. The package types of the M251/M252 series include TSSOP20 (4.4mm x 6.5mm), TSSOP28 (4.4mmx9.7mm), QFN33 (5mm x 5mm), LQFP48 (7mm x 7mm), LQFP64 (7mm x 7mm) and LQFP128 (14mm x 14mm). Pin-to-pin

compatible in same package makes optimizing product features and performance easy.

Nuvoton NuMaker M251/M252 evaluation boards and Nu-Link debugger are available for evaluation and product development. 3rd Party IDEs such as Keil MDK, IAR EWARM and Eclipse IDE with GNU GCC compilers, are also supported.

Table 1-1 NuMicro[®] M251/M252 Series Key Features Support Table

The NuMicro[®] M251/M252 series is suitable for a wide range of applications such as:

- Smart Home / Smart Home Appliance
- Industrial Control / Industrial Automation
- Smart City
- IoT Device
- Security Alarm System
- Electronic Payments
- Communication Modules
- Portable Wireless Data Collector
- Smart Door lock
- Handheld Medical Device
- (GPS) Location Tracker
- Electronic Shelf Labels (ESL)

2 FEATURES

2.1 M251/M252 Series Features

Core and System	
Arm® Cortex®-M23 without TrustZone®	<ul style="list-style-type: none"> • Arm® Cortex®-M23 processor, running up to 48 MHz when $V_{DD} = 1.75V \sim 5.5V$ • Built-in PMSAv8 Memory Protection Unit (MPU) • Built-in Nested Vectored Interrupt Controller (NVIC) • 32-bit Single-cycle hardware multiplier and 32-bit 17-cycle hardware divider • 24-bit system tick timer • Supports Programmable and maskable interrupt • Supports Low Power Sleep mode by WFI and WFE instructions • Supports single cycle I/O access • Supports XOM feature with 1 region
Low power mode and current	<ul style="list-style-type: none"> • Low Power mode: <ul style="list-style-type: none"> - Idle mode • Power-down mode (PD) <ul style="list-style-type: none"> - Fast Wake-up Power-down mode (FWPD) - Deep Power-down mode (DPD)
Wake-up source and wakeup time	<ul style="list-style-type: none"> • USCI, RTC, WDT, I²C, Timer, UART, BOD, LVR, POR, GPIO, USB, Tamper, ACMP, Debug interface, NMI and Reset pin from Power-down mode or Fast Wake-up Power-down mode • RTC, Wake-up Timer, LVR, Wake-up pins, Tamper, from Deep Power-down mode
Power supply and low voltage detect	<ul style="list-style-type: none"> • Built-in LDO for wide operating voltage from 1.75V to 5.5V • Core power voltage: 1.5V • Brown-out detector <ul style="list-style-type: none"> - With 7 levels: 4.4V/3.7V/3.0V/2.7V/2.4V/2.0V/1.8V - Supports Brown-out Interrupt and Reset option • Low Voltage Reset <ul style="list-style-type: none"> - Threshold voltage levels: 1.55V
Cyclic Redundancy Calculation Unit	<ul style="list-style-type: none"> • Supports four common polynomials CRC-CCITT, CRC-8, CRC-16, and CRC-32 • Programmable order reverse setting for input data and CRC checksum • Programmable 1's complement setting for input data and CRC

	<p>checksum.</p> <ul style="list-style-type: none"> • Supports 8-/16-/32-bit of data width • Programmable seed value • 8-bit write mode: 1-AHB clock cycle operation • 16-bit write mode: 2-AHB clock cycle operation • 32-bit write mode: 4-AHB clock cycle operation • Supports using PDMA to write data to perform CRC operation
Voltage Adjustable Interface	<ul style="list-style-type: none"> • Supports up to 6 VAI pins • User Configurable 1.65V ~ 5.5V I/O Interface with a dedicated power input (V_{DDIO}) • Supports UART0~1, SPI0~1, I2C0~1, USC12 and SC0 interface
Security	<ul style="list-style-type: none"> • 96-bit Unique ID (UID) • 128-bit Unique Customer ID (UCID)
Memories	
Flash	<ul style="list-style-type: none"> • Up to 256 KB application ROM (APROM) • 4 KB Flash for user program loader (LDROM) • Up to 48 MHz with zero wait state for consecutive address read access • 12 bytes User Configuration Block to control system initiation. • 512B page erase for all embedded Flash • 32-bit and multi-word Flash programming function. • Supports In-System-Programming (ISP), In-Application-Programming (IAP) update embedded Flash memory • Supports CRC-32 checksum calculation function • Supports Flash all one verification function (hardware can check page erase verify) • Hardware external read protection of whole Flash memory by Security Lock Bit • Supports XOM feature with 1 region
SRAM	<ul style="list-style-type: none"> • Up to 32 KB embedded SRAM • Supports byte-, half-word- and word-access • Supports PDMA mode
Peripheral DMA (PDMA)	<ul style="list-style-type: none"> • Up to 8 independent configurable channels for automatic data transfer between memories and peripherals • Channel 0 to 5 support stride features

- Channel 0, 1 support time-out function
- Basic and Scatter-Gather Transfer modes
- Each channel supports circular buffer management using Scatter-Gather Transfer mode
- Two types of priorities modes: Fixed-priority and Round-robin modes
- Transfer data width of 8, 16, and 32 bits
- Single and burst transfer type
- Source and destination address can be increment or fixed
- PDMA transfer count up to 65536
- Request source form software, PSIO, SPI/I²S, UART, USCI, EADC, DAC, PWM capture event or TIMER

Clocks

Clock Source

- Built-in 4.032 MHz internal high speed RC oscillator (MIRC) for system operation (Factory pre-trimmed to ±0.25% and frequency deviation ±10% over entire temperature from -40°C to 105°C)
- Built-in 48 MHz internal high speed RC oscillator (HIRC) for system operation (Factory pre-trimmed to ±0.25% and frequency deviation ±2% over entire temperature from -40°C to 105°C)
- Built-in 38.4 kHz internal low speed RC oscillator (LIRC) for Watchdog Timer and wake-up operation.
- Built-in 4~32 MHz external high speed crystal oscillator (HXT) for precise timing operation
- Built-in 32.768 kHz external low speed crystal oscillator (LXT) for RTC function and low-power system operation
- Supports one PLL up to 100 MHz for high performance system operation, sourced from HIRC and HXT
- Supports clock on-the-fly switch
- Supports clock failure detection for high/low speed external crystal oscillator
- HXT clock frequency accuracy detector
- Supports exception (NMI) generated once a clock failure detected
- Supports divided clock output

Timers

TIMER mode

32-bit Timer

- 4 sets of 32-bit timers with 24-bit up counters and 8-bit prescale counters
- Independent clock source for each timer
- One-shot, Periodic, Toggle and Continuous Counting operation

	<p>modes</p> <ul style="list-style-type: none"> • Event counting function to count the event from external pin • Input capture function to capture or reset counter value • External capture pin event for interval measurement. • External capture pin event to reset 24-bit up counter. • Chip wake-up from Idle/Power-down mode if a timer interrupt signal is generated • Timer interrupt flag or external capture interrupt flag to trigger BPWM, PWM, EADC, DAC and PDMA. • Internal capture triggered source from ACMP output. • Inter-Timer trigger capture mode <p>PWM mode</p> <ul style="list-style-type: none"> • 16-bit compare register and period register • Double buffer for period register and compare register • Supports inverse in PWM output • PWM interrupt wake-up from system Power-down mode
<p>BPWM</p>	<ul style="list-style-type: none"> • Supports maximum clock frequency up to 96 MHz • Each module provides 6 output channels • Supports independent mode for BPWM output/Capture input channel • Supports 12-bit prescaler from 1 to 4096 • Supports 16-bit resolution BPWM counter, each module provides 1 BPWM counter <ul style="list-style-type: none"> - Up, down or up/down counter operation type • Supports mask function and tri-state enable for each BPWM pin • Supports interrupt on the following events: <ul style="list-style-type: none"> - BPWM counter match 0, period value or compared value • Supports trigger ADC on the following events: <ul style="list-style-type: none"> - BPWM counter match 0, period value or compared value • Capture Function Features <ul style="list-style-type: none"> - Up to 6 capture input channels with 16-bit resolution - Supports rising or falling capture condition - Supports input rising/falling capture interrupt - Supports rising/falling capture with counter reload option
<p>PWM</p>	<ul style="list-style-type: none"> • Supports maximum clock frequency up to 96 MHz • Up to two PWM modules; each module provides 6 output channels.

-
- Supports independent mode for PWM output/Capture input channel
 - Supports complementary mode for 3 complementary paired PWM output channel
 - Dead-time insertion with 12-bit resolution
 - Two compared values during one period
 - Supports 12-bit prescaler from 1 to 4096
 - Supports 16-bit resolution PWM counter
 - Up, down or up/down counter operation type
 - Supports mask function and tri-state enable for each PWM pin
 - Supports brake function
 - Brake source from pin and system safety events (clock failed, Brown-out detection and CPU lockup)
 - Noise filter for brake source from pin
 - Edge detect brake source to control brake state until brake interrupt cleared
 - Level detect brake source to auto recover function after brake condition removed
 - Supports interrupt on the following events:
 - PWM counter match 0, period value or compared value
 - Brake condition happened
 - Supports trigger ADC on the following events:
 - PWM counter match 0, period value or compared value
 - Capture Function Features
 - Up to 12 capture input channels with 16-bit resolution
 - Supports rising or falling capture condition
 - Supports input rising/falling capture interrupt
 - Supports rising/falling capture with counter reload option
 - Supports PDMA transfer function for all PWM channels

Watchdog

- 20-bit free running up counter for WDT time-out interval
 - Clock sources from LIRC (default), HCLK/2048 or LXT
 - 9 selectable time-out period from 488us ~ 32 sec
 - Able to wake up from Power-down or Idle mode
 - Interrupt or reset selectable on watchdog time-out
 - Selectable WDT reset delay period, including 1026, 130, 18 or 3 WDT_CLK reset delay period
 - Force WDT enabled after chip power on or reset.
 - WDT time-out wake-up function only if WDT clock source is
-

	selected as LIRC or LXT
Window Watchdog	<ul style="list-style-type: none"> • Clock sources from HCLK/2048 (default) or LIRC • Window set by 6-bit down counter with 11-bit prescaler • WWDT counter suspends in Idle/Power-down mode • Supports Interrupt
RTC	<ul style="list-style-type: none"> • Supports external power pin V_{BAT} • Software compensation by setting frequency compensate register (FCR), compensated clock accuracy reaches $\pm 5\text{ppm}$ within 5 seconds • RTC counter (second, minute, hour) and calendar counter (day, month, year) • Alarm registers (second, minute, hour, day, month, year) • Selectable 12-hour or 24-hour mode • Automatic leap year recognition • Day of the Week counter • Daylight Saving Time software control • Periodic time tick interrupt with 8 period options 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 or 1 second • 1 Hz clock output for RTC calibration • Wake-up from idle mode and power down mode • 32 kHz oscillator gain control • RTC Time Tick and Alarm Match interrupt
Tamper	<ul style="list-style-type: none"> • 20 bytes spare registers and 1 tamper pin to clear the content of these spare registers • Selectable spare register erase function • Supports Timestamp function

Analog Interfaces

EADC	<ul style="list-style-type: none"> • Conversion results held in 19 data registers with valid and overrun indicators. • Analog input voltage: $0 \sim V_{REF}$ (Max to AV_{DD}). • Reference voltage from V_{REF} pin, AV_{DD} or internal V_{REF} • 12-bit resolution and 10-bit accuracy guaranteed • Up to 16 single-end analog external input channels • Supports 3 internal channels: <ul style="list-style-type: none"> - Band-gap VBG output or Internal voltage reference - Temperature sensor input
-------------	---

-
- V_{BAT} voltage measure ($V_{BAT}/4$)
 - Four ADC interrupts (ADINT0~3) with individual interrupt vector addresses.
 - ADC clock frequency up to 16 MHz.
 - Up to 880 kSPS conversion rate.
 - Configurable ADC internal sampling time
 - Up to 19 sample modules
 - Each of sample module 0~15 which is configurable for ADC converter channel
 - EADC_CH0~15 and trigger source.
 - Configurable PDMA
 - Configured resolution for 12-bit or 16-bit result
 - Supports Left-adjusted result
 - Averaging and oversampling (2^n times, $n=0\sim8$) to support up to 16-bit result
 - Sample module 16~18 is fixed for ADC channel 16, 17, 18 input sources as band-gap voltage, temperature sensor, and battery power ($V_{BAT}/4$).
 - Configurable sampling time for each sample module.
 - Conversion results held in 19 data registers with valid and overrun indicators.
 - Supports digital comparator to monitor conversion result that can be under or over the compare register setting
 - Generate an interrupt when conversion result matches the compare register setting.
 - Internal reference voltage source:
 - 1.536V, 2.048V, 2.560V, 3.072V, or 4.096V
 - An A/D conversion can be started by:
 - Write 1 to SWTRGn (EADC_SWTRG[n], $n = 0\sim18$)
 - External pin STADC
 - Timer0~3 overflow pulse triggers
 - ADINT0/1 interrupt EOC (End of conversion) pulse triggers
 - PWM triggers
 - BPWM triggers
 - Supports PDMA transfer
 - Auto turn on/off ADC power at power down or operation mode with wait state

DAC

- Analog output voltage: $0\sim AV_{DD}$
 - Supports 12-or 8-bit output mode
-

	<ul style="list-style-type: none"> • Rail to rail settle time 6μs • Up to one 12-bit, 1 MSPS voltage type DAC • Reference voltage from internal reference voltage or V_{REF} pin • Conversion updating rate up to 1 MSPS • Supports voltage output buffer mode and bypass voltage output buffer mode • Supports software and hardware trigger, including Timer0~3 and external trigger pin to start DAC conversion • Supports PDMA mode
--	--

Analog Comparator (ACMP)

	<ul style="list-style-type: none"> • Up to two rail-to-rail analog comparators • 4 multiplexed I/O pins at positive node • Negative node: <ul style="list-style-type: none"> - One I/O pin - Band-gap (VBG) - DAC0 output - Comparator Reference Voltage (CRV) • Programmable propagation speed and low power consumption • Interrupts generated when compare results change (Interrupt event condition programmable) • Supports Power-down Wake-up • Supports triggers for break events and cycle-by-cycle control for PWM • Supports window compare mode and window latch mode • Supports programmable hysteresis window: <ul style="list-style-type: none"> - 0 mV, 10 mV, 20 mV or 30 mV
--	--

OPA

	<ul style="list-style-type: none"> • Analog input voltage: 0~AV_{DD}. • Up to 1 operational amplifier • Supports to use schmitt trigger buffer output for simple comparator function • Supports schmitt trigger buffer output interrupts.
--	--

Internal Reference Voltage

	<ul style="list-style-type: none"> • Internal reference voltage select: 1.536V, 2.048V, 2.560V, 3.072V, 4.096V for EADC, DAC and CRV (comparator reference voltage) reference voltage
--	--

Communication Interfaces

UART

	<ul style="list-style-type: none"> • Supports up to 3 UARTs: UART0, UART1 and UART2 • UART clock source can be from LIRC • UART baud rate clock from LXT(32.768 kHz) with 9600bps in
--	---

Power-down mode

- Baud rate up to 10 Mbps
- Full-duplex asynchronous communications
- Supports one-wire half-duplex communications
- Separates receive and transmit 16/16 bytes FIFO
- Programmable receiver buffer trigger level
- Hardware auto-flow control (CTS and RTS)
- IrDA (SIR) function
 - Supports 3/16 bit duration for normal mode
- RS-485 9-bit mode and direction control
- UART0 supports LIN function
 - LIN master/slave mode
 - Programmable break generation function for transmitter
 - Break detection function for receiver
- Programmable baud-rate generator up to 1/16 system clock
- 8-bit receiver FIFO time-out detection function
- Programmable transmitting data delay time between the last stop and the next start bit
- Auto-Baud Rate measurement and baud rate compensation function
- Break error, frame error, parity error and receive/transmit FIFO overflow detection function
- Supports RS-485 mode:
 - RS-485 9-bit mode
 - Hardware or software enables to program nRTS pin to control RS-485 transmission direction
 - nCTS, incoming data, Received Data FIFO reached threshold and RS-485 Address Match (AAD mode) wake-up function in Power-down mode.
 - Hardware or software enables to program nRTS pin to control RS-485 transmission direction
- Fully programmable serial-interface:
 - Programmable number of data bit, 5-, 6-, 7-, 8- bit character
 - Programmable parity bit, even, odd, no parity or stick parity bit generation and detection
 - Programmable stop bit, 1, 1.5, or 2 stop bit generation
- Supports PDMA mode

Smart Card Interface

Smart card mode

- ISO 7816-3 T = 0, T = 1 compliant

-
- EMV2000 compliant
 - One ISO 7816-3 port
 - Separates receive/transmit 4 byte entry FIFO for data payloads
 - Programmable transmission clock frequency
 - Programmable receiver buffer trigger level
 - Programmable guard time selection (11 ETU ~ 267 ETU)
 - One 24-bit timer and two 8-bit timers for Answer to Request (ATR) and waiting times processing
 - Supports auto direct / inverse convention function
 - Supports transmitter and receiver error retry and error number limiting function
 - Supports hardware activation sequence process, and the time between PWR on and CLK start is configurable
 - Supports hardware warm reset sequence process
 - Supports hardware deactivation sequence process
 - Supports hardware auto deactivation sequence when the card removal is detected

UART mode

- Full duplex, asynchronous communications
- Separates receiving / transmitting 4 bytes entry FIFO for data payloads
- Supports programmable baud rate generator
- Supports programmable receiver buffer trigger level
- Programmable transmitting data delay time between the last stop bit leaving the TX-FIFO and the de-assertion
- Programmable even, odd or no parity bit generation and detection
- Programmable stop bit, 1- or 2- stop bit generation

SPI

-
- Supports Master or Slave mode operation
 - Master and slave mode up to 25 MHz (when chip works at $V_{DD} = 3.0 \sim 5.5V$)
 - Supports 2-bit Transfer mode
 - Supports Dual and Quad I/O Transfer mode
 - Configurable bit length of a transaction word from 8 to 32-bit
 - Provides separate 8-level depth transmit and receive FIFO buffers
 - Supports MSB first or LSB first transfer sequence
 - Supports Byte Reorder function
 - Supports Byte or Word Suspend mode
 - Supports PDMA transfer

-
- Supports 3-Wire, no slave selection signal, bi-direction interface
 - Supports one data channel half-duplex transfer
 - Supports receive-only mode
-

I²C

- Up to 2 sets of I²C devices
 - Master/Slave mode
 - Bidirectional data transfer between masters and slaves
 - Multi-master bus (no central master)
 - 7-bit and 10-bit addressing mode
 - Standard mode (100 kbps), Fast mode (400 kbps) and Fast mode plus (1 Mbps)
 - Arbitration between simultaneously transmitting masters without corruption of serial data on the bus
 - Serial clock synchronization allows devices with different bit rates to communicate via one serial bus
 - Serial clock synchronization can be used as a handshake mechanism to suspend and resume serial transfer
 - Supports 14-bit time-out counter requesting the I²C interrupt if the I²C bus hangs up and timer-out counter overflows
 - Programmable clocks allow versatile rate control
 - Multiple address recognition (four slave address with mask option)
 - Supports setup/hold time programmable
 - Supports SMBus and PMBus
 - Multi-address Power-down wake-up function
 - Supports PDMA transfer
-

SPI Mode

SPI/I²S

- Up to 1 set of SPI controller
 - Master or Slave mode operation
 - Configurable bit length of a transfer word from 8 to 32-bit
 - Provides separate 4-level of 32-bit (or 8-level of 16-bit) transmit and receive FIFO buffers which depended on SPI setting of data width
 - MSB first or LSB first transfer sequence
 - Supports byte reorder function
 - Byte or Word Suspend mode
 - Master and slave mode up to 25 MHz (V_{DD} = 3.0V ~5.5V)
 - Supports one data channel half-duplex transfer
 - Supports receive-only mode
-

-
- Supports PDMA transfer

I²S Mode

- Up to 1 sets of I²S by SPI controllers
 - Interface with external audio CODEC
 - Supports Master and Slave mode
 - Capable of handling 8-, 16-, 24- and 32-bit word sizes
 - Mono and stereo audio data
 - PCM mode A, PCM mode B, I²S and MSB justified data format
 - Each provides two 4-level FIFO data buffers, one for transmitting and the other for receiving
 - Generates interrupt requests when buffer levels cross a programmable boundary
 - Each supports two PDMA requests, one for transmitting and the other for receiving
-

- Up to 3 sets of USCI: USCI0, USCI1 and USCI2
- Supports UART, SPI and I²C function
- Single byte TX and RX buffer mode

USCI_UART

- One transmit buffer and two receive buffer for data payload
- Hardware auto flow control function and programmable flow control trigger level
- Programmable baud-rate generator
- Supports 9-bit data transfer
- Baud rate detection by built-in capture event of baud rate generator
- Supports Wake-up function (Data and nCTS Wakeup Only)
- Supports PDMA transfer

Universal Serial Control Interface (USCI)

USCI_SPI

- Master or Slave mode operation
 - Configurable bit length of a transfer word from 4 to 16-bit
 - One transmit buffer and two receive buffer for data payload
 - MSB first or LSB first transfer sequence
 - Word suspend function
 - Supports PDMA transfer
 - Supports 3-wire, no slave select signal, bi-direction interface
 - Wake-up function: input slave select transition
 - Supports one data channel half-duplex transfer
-

USCI_I2C

- Full master and slave device capability
- 7-bit/10-bit addressing mode
- Communication in Standard mode (100 kbps), Fast mode (up to 400 kbps) and Fast mode plus (1 Mbps)
- Multi-master bus
- One transmit buffer and two receive buffer for data payload
- 10-bit bus time out capability
- Supports Bus monitor mode
- Wake-up by data toggle or address match in Power-down mode
- Multiple address recognition
- Setup/hold time programmable

External Bus Interface (EBI)

- Supports up to three memory banks
- Supports dedicated external chip select pin with polarity control for each bank
- Accessible space up to 1 Mbytes for each bank
- Byte write in 16-bit data width mode
- Address/Data multiplexed and separate mode
- Timing parameters individual adjustment for each memory block
- Supports LCD interface i80 mode
- Supports Continuous Data Access mode
- Supports PDMA mode

GPIO

- Four I/O modes:
 - Quasi bi-direction
 - Push-Pull output
 - Open-Drain output
 - Input only with high impedance
 - TTL/Schmitt trigger input selectable
 - I/O pin configured as interrupt source with edge/level trigger setting
 - Independent pull-up/pull-down control
 - High driver and high sink current I/O (up to 16 mA at 5V, 25°C)
 - Minimum I/O Speed
 - 25 MHz when $V_{DD} = 2.7 \sim 5.5 \text{ V}$ (-40°C ~ +105°C, CL=35p, high skew rate enabled)
 - 10 MHz when $V_{DD} = 1.75 \sim 5.5 \text{ V}$ (-40°C ~ +105°C, CL=35p,
-

high skew rate enabled)

- Software selectable slew rate control
 - Supports wake-up function
 - Supports I/O de-bounce with LIRC at power down
 - I/O configurations of multi-function pin are controlled by module or MFOS register settings.
-

PSIO

- Supports up to 8 PSIO pins, from PSIO pin0 to PSIO pin7
 - Supports 6 clock source selections: HXT, LXT, HIRC, LIRC, PLL, or PCLK1
 - Supports one clock divider, which can be divided from 1 to 255
 - Supports slot controller for timing sequence control
 - Supports 4 slot controllers, 8 slots in each slot controller
 - Supports counting from 1 PSIO clock to 15 PSIO clocks in each slot
 - Supports 3 slot repeat modes
 - ◆ Normal repeat mode
 - ◆ Normal repeat mode with infinity loops
 - ◆ Whole repeat mode
 - Supports 4 slot trigger conditions
 - ◆ Triggered by software
 - ◆ Triggered by falling edge
 - ◆ Triggered by rising edge
 - ◆ Triggered by rising edge or falling edge
 - Supports PSIO PIN for pin state control
 - Supports 8 check points to connect with slots in each pin
 - Supports 8 check point actions in each check point.
 - Supports 7 kinds of check point action to setting
 - Output high
 - Output low
 - Output data
 - Output toggle
 - Input data
 - Input status
 - Input status update
 - Supports 4 I/O modes: input, output, open-drain, and quasi
 - Supports switch I/O mode in different check points
 - Supports 4 kinds of Interrupt trigger conditions:
-

-
- Two sets of configurable slot interrupt controllers
 - Mismatch interrupt when PSIO is enabled with PDMA
 - Transfer Error interrupt
 - Slot controller counting done interrupt
 - Supports PDMA function

Advanced Connectivity

- | | |
|---------------------------|--|
| USB 2.0 Full Speed | <ul style="list-style-type: none"> • Compliant with USB 2.0 Full-Speed specification • Provides 1 interrupt vector with 4 different interrupt events (NEVWK, VBUSDET, USB and BUS) • Suspend function when no bus activity exists for 3 ms • Supports 12 endpoints for configurable Control/Bulk/Interrupt/Isochronous transfer types and maximum 1024 bytes buffer size • Provides remote wake-up capability • Start of Frame (SOF) locked clock pulse generation • Supports USB 2.0 Link Power Management (LPM) • Supports Crystal-less function |

4 PIN CONFIGURATION

Users can find pin configuration information in chapter 4 or by using [NuTool - PinConfig](#). The NuTool - PinConfigure contains all NuMicro® Family chip series with all part number, and helps users configure GPIO multi-function correctly and handily.

Table 4.1-24 M252KG6AE Multi-function Pin Table

4.2 Pin Description

Different part number with same package might has different function. Please refer to the selection guide in section 3.2.

4.2.1 M251 Series Pin Description

Corresponding Part Number: M251Fx / M251Ex / M251Zx / M251Sx / M251Kx

MFP* = Multi-function pin. (Refer to section SYS_GP_x_MFPL and SYS_GP_x_MFPH)

PA.0 MFP0 means SYS_GPA_MFPL[3:0] = 0x0.

PA.9 MFP5 means SYS_GPA_MFPH[7:4] = 0x5

20 Pin	28 Pin	33 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
8	12	1	1	2	1	PB.5	I/O	MFP0	General purpose digital I/O pin.
						EADC0_CH5	A	MFP1	EADC0 channel 5 analog input.
						ACMP1_N	A	MFP1	Analog comparator 1 negative input pin.
						EBI_ADR0	O	MFP2	EBI address bus bit 0.
						I2C0_SCL	I/O	MFP6	I2C0 clock pin.
						USC11_CTL0	I/O	MFP8	USC11 control 0 pin.
						SC0_CLK	O	MFP9	Smart Card 0 clock pin.
						PWM0_CH0	I/O	MFP11	PWM0 channel 0 output/capture input.
						PSIO0_CH4	I/O	MFP12	PSIO 0 channel 4 input/output pin.
						UART2_TXD	O	MFP13	UART2 data transmitter output pin.
						TM0	I/O	MFP14	Timer0 event counter input/toggle output pin.
						INT0	I	MFP15	External interrupt 0 input pin.
9	13	2	2	3	2	PB.4	I/O	MFP0	General purpose digital I/O pin.
						EADC0_CH4	A	MFP1	EADC0 channel 4 analog input.
						ACMP1_P1	A	MFP1	Analog comparator 1 positive input 1 pin.
						EBI_ADR1	O	MFP2	EBI address bus bit 1.
						I2C0_SDA	I/O	MFP6	I2C0 data input/output pin.
						USC11_CTL1	I/O	MFP8	USC11 control 1 pin.
						SC0_DAT	I/O	MFP9	Smart Card 0 data pin.
						PWM0_CH1	I/O	MFP11	PWM0 channel 1 output/capture input.
						PSIO0_CH5	I/O	MFP12	PSIO 0 channel 5 input/output pin.
						UART2_RXD	I	MFP13	UART2 data receiver input pin.

20 Pin	28 Pin	33 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
						INT1	I	MFP15	External interrupt 1 input pin.
10	14	3	3	4	3	PB.3	I/O	MFP0	General purpose digital I/O pin.
						EADC0_CH3	A	MFP1	EADC0 channel 3 analog input.
						ACMP0_N	A	MFP1	Analog comparator 0 negative input pin.
						EBI_ADR2	O	MFP2	EBI address bus bit 2.
						I2C1_SCL	I/O	MFP4	I2C1 clock pin.
						UART1_TXD	O	MFP6	UART1 data transmitter output pin.
						USC11_DAT1	I/O	MFP8	USC11 data 1 pin.
						SC0_RST	O	MFP9	Smart Card 0 reset pin.
						PWM0_CH2	I/O	MFP11	PWM0 channel 2 output/capture input.
						PSIO0_CH6	I/O	MFP12	PSIO 0 channel 6 input/output pin.
						PWM0_BRAKE0	I	MFP13	PWM0 Brake 0 input pin.
						TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
						INT2	I	MFP15	External interrupt 2 input pin.
11	15	4	4	5	4	PB.2	I/O	MFP0	General purpose digital I/O pin.
						EADC0_CH2	A	MFP1	EADC0 channel 2 analog input.
						ACMP0_P1	A	MFP1	Analog comparator 0 positive input 1 pin.
						OPA0_O	A	MFP1	Operational amplifier 0 output pin.
						EBI_ADR3	O	MFP2	EBI address bus bit 3.
						I2C1_SDA	I/O	MFP4	I2C1 data input/output pin.
						UART1_RXD	I	MFP6	UART1 data receiver input pin.
						USC11_DAT0	I/O	MFP8	USC11 data 0 pin.
						SC0_PWR	O	MFP9	Smart Card 0 power pin.
						PWM0_CH3	I/O	MFP11	PWM0 channel 3 output/capture input.
						PSIO0_CH7	I/O	MFP12	PSIO 0 channel 7 input/output pin.
						TM3	I/O	MFP14	Timer3 event counter input/toggle output pin.
						INT3	I	MFP15	External interrupt 3 input pin.
					5	PC.12	I/O	MFP0	General purpose digital I/O pin.
						EBI_ADR4	O	MFP2	EBI address bus bit 4.
						UART0_TXD	O	MFP3	UART0 data transmitter output pin.
						I2C0_SCL	I/O	MFP4	I2C0 clock pin.

20 Pin	28 Pin	33 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
						SC0_nCD	I	MFP9	Smart Card 0 card detect pin.
						PWM1_CH0	I/O	MFP12	PWM1 channel 0 output/capture input.
						ACMP0_O	O	MFP14	Analog comparator 0 output pin.
					6	PC.11	I/O	MFP0	General purpose digital I/O pin.
						EBI_ADR5	O	MFP2	EBI address bus bit 5.
						UART0_RXD	I	MFP3	UART0 data receiver input pin.
						I2C0_SDA	I/O	MFP4	I2C0 data input/output pin.
						PWM1_CH1	I/O	MFP12	PWM1 channel 1 output/capture input.
						ACMP1_O	O	MFP14	Analog comparator 1 output pin.
					7	PC.10	I/O	MFP0	General purpose digital I/O pin.
						EBI_ADR6	O	MFP2	EBI address bus bit 6.
						PWM1_CH2	I/O	MFP12	PWM1 channel 2 output/capture input.
					8	PC.9	I/O	MFP0	General purpose digital I/O pin.
						EBI_ADR7	O	MFP2	EBI address bus bit 7.
						PWM1_CH3	I/O	MFP12	PWM1 channel 3 output/capture input.
	16	5	5	6	9	PB.1	I/O	MFP0	General purpose digital I/O pin.
						EADC0_CH1	A	MFP1	EADC0 channel 1 analog input.
						OPA0_N	A	MFP1	Operational amplifier 0 negative input pin.
						EBI_ADR8	O	MFP2	EBI address bus bit 8.
						UART2_TXD	O	MFP7	UART2 data transmitter output pin.
						USC11_CLK	I/O	MFP8	USC11 clock pin.
						I2C1_SCL	I/O	MFP9	I2C1 clock pin.
						QSPI0_MISO1	I/O	MFP10	Quad SPI0 MISO1 (Master In, Slave Out) pin.
						PWM0_CH4	I/O	MFP11	PWM0 channel 4 output/capture input.
						PWM1_CH4	I/O	MFP12	PWM1 channel 4 output/capture input.

						EADC0_CH10	A	MFP1	EADC0 channel 10 analog input.
						EBI_ADR17	O	MFP2	EBI address bus bit 17.
						USCI1_CTL0	I/O	MFP4	USCI1 control 0 pin.
						UART0_nRTS	O	MFP5	UART0 request to Send output pin.
						I2C1_SDA	I/O	MFP7	I2C1 data input/output pin.
						BPWM1_CH1	I/O	MFP10	BPWM1 channel 1 output/capture input.
				62	125	PB.9	I/O	MFP0	General purpose digital I/O pin.
						EADC0_CH9	A	MFP1	EADC0 channel 9 analog input.
						EBI_ADR18	O	MFP2	EBI address bus bit 18.
						USCI1_CTL1	I/O	MFP4	USCI1 control 1 pin.
						UART0_TXD	O	MFP5	UART0 data transmitter output pin.
						UART1_nCTS	I	MFP6	UART1 clear to Send input pin.
						I2C1_SMBAL	O	MFP7	I2C1 SMBus SMBALTER pin

20 Pin	28 Pin	33 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
						BPWM1_CH2	I/O	MFP10	BPWM1 channel 2 output/capture input.
				63	126	PB.8	I/O	MFP0	General purpose digital I/O pin.
						EADC0_CH8	A	MFP1	EADC0 channel 8 analog input.
						EBI_ADR19	O	MFP2	EBI address bus bit 19.
						USCI1_CLK	I/O	MFP4	USCI1 clock pin.
						UART0_RXD	I	MFP5	UART0 data receiver input pin.
						UART1_nRTS	O	MFP6	UART1 request to Send output pin.
						I2C1_SMBSUS	O	MFP7	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)
						BPWM1_CH3	I/O	MFP10	BPWM1 channel 3 output/capture input.
			47	64	127	PB.7	I/O	MFP0	General purpose digital I/O pin.
						EADC0_CH7	A	MFP1	EADC0 channel 7 analog input.
						EBI_nWRL	O	MFP2	EBI low byte write enable output pin.
						USCI1_DAT0	I/O	MFP4	USCI1 data 0 pin.
						UART1_TXD	O	MFP6	UART1 data transmitter output pin.
						EBI_nCS0	O	MFP8	EBI chip select 0 output pin.
						BPWM1_CH4	I/O	MFP10	BPWM1 channel 4 output/capture input.
						PWM1_BRAKE0	I	MFP11	PWM1 Brake 0 input pin.
						PWM1_CH4	I/O	MFP12	PWM1 channel 4 output/capture input.
						INT5	I	MFP13	External interrupt 5 input pin.
						ACMP0_O	O	MFP15	Analog comparator 0 output pin.
			48	1	128	PB.6	I/O	MFP0	General purpose digital I/O pin.
						EADC0_CH6	A	MFP1	EADC0 channel 6 analog input.
						EBI_nWRH	O	MFP2	EBI high byte write enable output pin
						USCI1_DAT1	I/O	MFP4	USCI1 data 1 pin.
						UART1_RXD	I	MFP6	UART1 data receiver input pin.
						EBI_nCS1	O	MFP8	EBI chip select 1 output pin.
						BPWM1_CH5	I/O	MFP10	BPWM1 channel 5 output/capture input.
						PWM1_BRAKE1	I	MFP11	PWM1 Brake 1 input pin.
						PWM1_CH5	I/O	MFP12	PWM1 channel 5 output/capture input.
						INT4	I	MFP13	External interrupt 4 input pin.
						ACMP1_O	O	MFP15	Analog comparator 1 output pin.

4.2.2 M252 Series Pin Description

Corresponding Part Number: M252Fx / M252Ex / M252Zx / M252Sx / M252Kx

MFP* = Multi-function pin. (Refer to section SYS_GP_x_MFPL and SYS_GP_x_MFPH)

PA.0 MFP0 means SYS_GPA_MFPL[3:0] = 0x0.

PA.9 MFP5 means SYS_GPA_MFPH[7:4] = 0x5

20 Pin	28 Pin	33 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description

						BPWM1_CH1	I/O	MFP10	BPWM1 channel 1 output/capture input.
				62	125	PB.9	I/O	MFP0	General purpose digital I/O pin.
						EADC0_CH9	A	MFP1	EADC0 channel 9 analog input.
						EBI_ADR18	O	MFP2	EBI address bus bit 18.
						USCI1_CTL1	I/O	MFP4	USCI1 control 1 pin.
						UART0_TXD	O	MFP5	UART0 data transmitter output pin.
						UART1_nCTS	I	MFP6	UART1 clear to Send input pin.
						I2C1_SMBAL	O	MFP7	I2C1 SMBus SMBALTER pin
						BPWM1_CH2	I/O	MFP10	BPWM1 channel 2 output/capture input.
				63	126	PB.8	I/O	MFP0	General purpose digital I/O pin.
						EADC0_CH8	A	MFP1	EADC0 channel 8 analog input.
						EBI_ADR19	O	MFP2	EBI address bus bit 19.
						USCI1_CLK	I/O	MFP4	USCI1 clock pin.
						UART0_RXD	I	MFP5	UART0 data receiver input pin.
						UART1_nRTS	O	MFP6	UART1 request to Send output pin.
						I2C1_SMBSUS	O	MFP7	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)
						BPWM1_CH3	I/O	MFP10	BPWM1 channel 3 output/capture input.
			47	64	127	PB.7	I/O	MFP0	General purpose digital I/O pin.
						EADC0_CH7	A	MFP1	EADC0 channel 7 analog input.

20 Pin	28 Pin	33 Pin	48 Pin	64 Pin	128 Pin	Pin Name	Type	MFP	Description
						EBI_nWRL	O	MFP2	EBI low byte write enable output pin.
						USCI1_DAT0	I/O	MFP4	USCI1 data 0 pin.
						UART1_TXD	O	MFP6	UART1 data transmitter output pin.
						EBI_nCS0	O	MFP8	EBI chip select 0 output pin.
						BPWM1_CH4	I/O	MFP10	BPWM1 channel 4 output/capture input.
						PWM1_BRAKE0	I	MFP11	PWM1 Brake 0 input pin.
						PWM1_CH4	I/O	MFP12	PWM1 channel 4 output/capture input.
						INT5	I	MFP13	External interrupt 5 input pin.
						ACMP0_O	O	MFP15	Analog comparator 0 output pin.
			48	1	128	PB.6	I/O	MFP0	General purpose digital I/O pin.
						EADC0_CH6	A	MFP1	EADC0 channel 6 analog input.
						EBI_nWRH	O	MFP2	EBI high byte write enable output pin
						USCI1_DAT1	I/O	MFP4	USCI1 data 1 pin.
						UART1_RXD	I	MFP6	UART1 data receiver input pin.
						EBI_nCS1	O	MFP8	EBI chip select 1 output pin.
						BPWM1_CH5	I/O	MFP10	BPWM1 channel 5 output/capture input.
						PWM1_BRAKE1	I	MFP11	PWM1 Brake 1 input pin.
						PWM1_CH5	I/O	MFP12	PWM1 channel 5 output/capture input.
						INT4	I	MFP13	External interrupt 4 input pin.
						ACMP1_O	O	MFP15	Analog comparator 1 output pin.

4.2.3 M251/M252 Series Multi-function Summary Table Sorted by GPIO

Corresponding Part Number: M251 and M252 series

	Pin Name	Type	MFP	Description
PA.0	PA.0	I/O	MFP0	General purpose digital I/O pin.
	QSPIO_MOSI0	I/O	MFP3	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
	SPIO_MOSI	I/O	MFP4	SPIO MOSI (Master Out, Slave In) pin.
	SC0_CLK	O	MFP6	Smart Card 0 clock pin.
	UART0_RXD	I	MFP7	UART0 data receiver input pin.
	UART1_nRTS	O	MFP8	UART1 request to Send output pin.
	PSIO0_CH7	I/O	MFP10	PSIO 0 channel 7 input/output pin.
	USCI2_DAT1	I/O	MFP11	USCI2 data 1 pin.
	BPWM0_CH0	I/O	MFP12	BPWM0 channel 0 output/capture input.
	PWM0_CH5	I/O	MFP13	PWM0 channel 5 output/capture input.
	DAC0_ST	I	MFP15	DAC0 external trigger input.
PA.1	PA.1	I/O	MFP0	General purpose digital I/O pin.
	QSPIO_MISO0	I/O	MFP3	Quad SPI0 MISO0 (Master In, Slave Out) pin.
	SPIO_MISO	I/O	MFP4	SPIO MISO (Master In, Slave Out) pin.
	SC0_DAT	I/O	MFP6	Smart Card 0 data pin.
	UART0_TXD	O	MFP7	UART0 data transmitter output pin.
	UART1_nCTS	I	MFP8	UART1 clear to Send input pin.
	PSIO0_CH6	I/O	MFP10	PSIO 0 channel 6 input/output pin.
	USCI2_DAT0	I/O	MFP11	USCI2 data 0 pin.
	BPWM0_CH1	I/O	MFP12	BPWM0 channel 1 output/capture input.
	PWM0_CH4	I/O	MFP13	PWM0 channel 4 output/capture input.
PA.2	PA.2	I/O	MFP0	General purpose digital I/O pin.
	QSPIO_CLK	I/O	MFP3	Quad SPI0 serial clock pin.
	SPIO_CLK	I/O	MFP4	SPIO serial clock pin.
	SC0_RST	O	MFP6	Smart Card 0 reset pin.
	I2C0_SMBSUS	O	MFP7	I2C0 SMBus SMBSUS pin (PMBus CONTROL pin)
	UART1_RXD	I	MFP8	UART1 data receiver input pin.
	I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
	PSIO0_CH5	I/O	MFP10	PSIO 0 channel 5 input/output pin.

	Pin Name	Type	MFP	Description
	USCI2_CLK	I/O	MFP11	USCI2 clock pin.
	BPWM0_CH2	I/O	MFP12	BPWM0 channel 2 output/capture input.
	PWM0_CH3	I/O	MFP13	PWM0 channel 3 output/capture input.
PA.3	PA.3	I/O	MFP0	General purpose digital I/O pin.
	QSPIO_SS	I/O	MFP3	Quad SPI0 slave select pin.
	SPIO_SS	I/O	MFP4	SPIO slave select pin.
	SC0_PWR	O	MFP6	Smart Card 0 power pin.
	I2C0_SMBAL	O	MFP7	I2C0 SMBus SMBALTER pin
	UART1_TXD	O	MFP8	UART1 data transmitter output pin.
	I2C1_SCL	I/O	MFP9	I2C1 clock pin.
	PSIO0_CH4	I/O	MFP10	PSIO 0 channel 4 input/output pin.
	USCI2_CTL0	I/O	MFP11	USCI2 control 0 pin.
	BPWM0_CH3	I/O	MFP12	BPWM0 channel 3 output/capture input.
	PWM0_CH2	I/O	MFP13	PWM0 channel 2 output/capture input.
	CLKO	O	MFP14	Clock Out
	PWM1_BRAKE1	I	MFP15	PWM1 Brake 1 input pin.
PA.4	PA.4	I/O	MFP0	General purpose digital I/O pin.
	QSPIO_MOSI1	I/O	MFP3	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
	SPIO_I2SMCLK	I/O	MFP4	SPIO I ² S master clock output pin
	SC0_nCD	I	MFP6	Smart Card 0 card detect pin.
	UART0_nRTS	O	MFP7	UART0 request to Send output pin.
	UART0_RXD	I	MFP8	UART0 data receiver input pin.
	I2C0_SDA	I/O	MFP9	I2C0 data input/output pin.
	USCI2_CTL1	I/O	MFP11	USCI2 control 1 pin.
	BPWM0_CH4	I/O	MFP12	BPWM0 channel 4 output/capture input.
	PWM0_CH1	I/O	MFP13	PWM0 channel 1 output/capture input.
PA.5	PA.5	I/O	MFP0	General purpose digital I/O pin.
	QSPIO_MISO1	I/O	MFP3	Quad SPI0 MISO1 (Master In, Slave Out) pin.
	UART0_nCTS	I	MFP7	UART0 clear to Send input pin.
	UART0_TXD	O	MFP8	UART0 data transmitter output pin.
	I2C0_SCL	I/O	MFP9	I2C0 clock pin.
	BPWM0_CH5	I/O	MFP12	BPWM0 channel 5 output/capture input.

	Pin Name	Type	MFP	Description
	PWM0_CH0	I/O	MFP13	PWM0 channel 0 output/capture input.
PA.6	PA.6	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD6	I/O	MFP2	EBI address/data bus bit 6.
	UART0_RXD	I	MFP7	UART0 data receiver input pin.
	I2C1_SDA	I/O	MFP8	I2C1 data input/output pin.
	PWM1_CH5	I/O	MFP11	PWM1 channel 5 output/capture input.
	BPWM1_CH3	I/O	MFP12	BPWM1 channel 3 output/capture input.
	ACMP1_WLAT	I	MFP13	Analog comparator 1 window latch input pin
	TM3	I/O	MFP14	Timer3 event counter input/toggle output pin.
	INT0	I	MFP15	External interrupt 0 input pin.
PA.7	PA.7	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD7	I/O	MFP2	EBI address/data bus bit 7.
	UART0_TXD	O	MFP7	UART0 data transmitter output pin.
	I2C1_SCL	I/O	MFP8	I2C1 clock pin.
	PWM1_CH4	I/O	MFP11	PWM1 channel 4 output/capture input.
	BPWM1_CH2	I/O	MFP12	BPWM1 channel 2 output/capture input.
	ACMP0_WLAT	I	MFP13	Analog comparator 0 window latch input pin
	TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
	INT1	I	MFP15	External interrupt 1 input pin.
PA.8	PA.8	I/O	MFP0	General purpose digital I/O pin.
	EBI_ALE	O	MFP2	EBI address latch enable output pin.
	USCIO_CTL1	I/O	MFP6	USCIO control 1 pin.
	UART1_RXD	I	MFP7	UART1 data receiver input pin.
	BPWM0_CH3	I/O	MFP9	BPWM0 channel 3 output/capture input.
	TM3_EXT	I/O	MFP13	Timer3 external capture input/toggle output pin.
	INT4	I	MFP15	External interrupt 4 input pin.
PA.9	PA.9	I/O	MFP0	General purpose digital I/O pin.
	EBI_MCLK	O	MFP2	EBI external clock output pin.
	USCIO_DAT1	I/O	MFP6	USCIO data 1 pin.
	UART1_TXD	O	MFP7	UART1 data transmitter output pin.
	BPWM0_CH2	I/O	MFP9	BPWM0 channel 2 output/capture input.
	TM2_EXT	I/O	MFP13	Timer2 external capture input/toggle output pin.

	Pin Name	Type	MFP	Description
PA.10	PA.10	I/O	MFP0	General purpose digital I/O pin.
	ACMP1_P0	A	MFP1	Analog comparator 1 positive input 0 pin.
	EBI_nWR	O	MFP2	EBI write enable output pin.
	USCIO_DAT0	I/O	MFP6	USCIO data 0 pin.
	BPWM0_CH1	I/O	MFP9	BPWM0 channel 1 output/capture input.
	TM1_EXT	I/O	MFP13	Timer1 external capture input/toggle output pin.
	DAC0_ST	I	MFP14	DAC0 external trigger input.
PA.11	PA.11	I/O	MFP0	General purpose digital I/O pin.
	ACMP0_P0	A	MFP1	Analog comparator 0 positive input 0 pin.
	EBI_nRD	O	MFP2	EBI read enable output pin.
	USCIO_CLK	I/O	MFP6	USCIO clock pin.
	BPWM0_CH0	I/O	MFP9	BPWM0 channel 0 output/capture input.
	TM0_EXT	I/O	MFP13	Timer0 external capture input/toggle output pin.
PA.12	PA.12	I/O	MFP0	General purpose digital I/O pin.
	I2C1_SCL	I/O	MFP4	I2C1 clock pin.
	USC12_DAT1	I/O	MFP8	USC12 data 1 pin.
	PSIO0_CH4	I/O	MFP10	PSIO 0 channel 4 input/output pin.
	BPWM1_CH2	I/O	MFP11	BPWM1 channel 2 output/capture input.
PA.13	PA.13	I/O	MFP0	General purpose digital I/O pin.
	I2C1_SDA	I/O	MFP4	I2C1 data input/output pin.
	USC12_DAT0	I/O	MFP8	USC12 data 0 pin.
	PSIO0_CH5	I/O	MFP10	PSIO 0 channel 5 input/output pin.
	BPWM1_CH3	I/O	MFP11	BPWM1 channel 3 output/capture input.
PA.14	PA.14	I/O	MFP0	General purpose digital I/O pin.
	UART0_TXD	O	MFP3	UART0 data transmitter output pin.
	USC12_CLK	I/O	MFP8	USC12 clock pin.
	PSIO0_CH6	I/O	MFP10	PSIO 0 channel 6 input/output pin.
	BPWM1_CH4	I/O	MFP11	BPWM1 channel 4 output/capture input.
PA.15	PA.15	I/O	MFP0	General purpose digital I/O pin.
	UART0_RXD	I	MFP3	UART0 data receiver input pin.
	USC12_CTL1	I/O	MFP8	USC12 control 1 pin.
	PSIO0_CH7	I/O	MFP10	PSIO 0 channel 7 input/output pin.

	Pin Name	Type	MFP	Description
	BPWM1_CH5	I/O	MFP11	BPWM1 channel 5 output/capture input.
PB.0	PB.0	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH0	A	MFP1	EADC0 channel 0 analog input.
	OPA0_P	A	MFP1	Operational amplifier 0 positive input pin.
	EBI_ADR9	O	MFP2	EBI address bus bit 9.
	UART2_RXD	I	MFP7	UART2 data receiver input pin.
	SPI0_I2SMCLK	I/O	MFP8	SPI0 I ² S master clock output pin
	I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
	QSPI0_MOSI1	I/O	MFP10	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
	PWM0_CH5	I/O	MFP11	PWM0 channel 5 output/capture input.
	PWM1_CH5	I/O	MFP12	PWM1 channel 5 output/capture input.
PWM0_BRAKE1	I	MFP13	PWM0 Brake 1 input pin.	
PB.1	PB.1	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH1	A	MFP1	EADC0 channel 1 analog input.
	OPA0_N	A	MFP1	Operational amplifier 0 negative input pin.
	EBI_ADR8	O	MFP2	EBI address bus bit 8.
	UART2_TXD	O	MFP7	UART2 data transmitter output pin.
	USCI1_CLK	I/O	MFP8	USCI1 clock pin.
	I2C1_SCL	I/O	MFP9	I2C1 clock pin.
	QSPI0_MISO1	I/O	MFP10	Quad SPI0 MISO1 (Master In, Slave Out) pin.
	PWM0_CH4	I/O	MFP11	PWM0 channel 4 output/capture input.
	PWM1_CH4	I/O	MFP12	PWM1 channel 4 output/capture input.
PWM0_BRAKE0	I	MFP13	PWM0 Brake 0 input pin.	
PB.2	PB.2	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH2	A	MFP1	EADC0 channel 2 analog input.
	ACMP0_P1	A	MFP1	Analog comparator 0 positive input 1 pin.
	OPA0_O	A	MFP1	Operational amplifier 0 output pin.
	EBI_ADR3	O	MFP2	EBI address bus bit 3.
	I2C1_SDA	I/O	MFP4	I2C1 data input/output pin.
	UART1_RXD	I	MFP6	UART1 data receiver input pin.
	USCI1_DAT0	I/O	MFP8	USCI1 data 0 pin.
	SC0_PWR	O	MFP9	Smart Card 0 power pin.

	Pin Name	Type	MFP	Description
	PWM0_CH3	I/O	MFP11	PWM0 channel 3 output/capture input.
	PSIO0_CH7	I/O	MFP12	PSIO 0 channel 7 input/output pin.
	TM3	I/O	MFP14	Timer3 event counter input/toggle output pin.
	INT3	I	MFP15	External interrupt 3 input pin.
PB.3	PB.3	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH3	A	MFP1	EADC0 channel 3 analog input.
	ACMP0_N	A	MFP1	Analog comparator 0 negative input pin.
	EBI_ADR2	O	MFP2	EBI address bus bit 2.
	I2C1_SCL	I/O	MFP4	I2C1 clock pin.
	UART1_TXD	O	MFP6	UART1 data transmitter output pin.
	USCI1_DAT1	I/O	MFP8	USCI1 data 1 pin.
	SC0_RST	O	MFP9	Smart Card 0 reset pin.
	PWM0_CH2	I/O	MFP11	PWM0 channel 2 output/capture input.
	PSIO0_CH6	I/O	MFP12	PSIO 0 channel 6 input/output pin.
	PWM0_BRAKE0	I	MFP13	PWM0 Brake 0 input pin.
	TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
	INT2	I	MFP15	External interrupt 2 input pin.
PB.4	PB.4	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH4	A	MFP1	EADC0 channel 4 analog input.
	ACMP1_P1	A	MFP1	Analog comparator 1 positive input 1 pin.
	EBI_ADR1	O	MFP2	EBI address bus bit 1.
	I2C0_SDA	I/O	MFP6	I2C0 data input/output pin.
	USCI1_CTL1	I/O	MFP8	USCI1 control 1 pin.
	SC0_DAT	I/O	MFP9	Smart Card 0 data pin.
	PWM0_CH1	I/O	MFP11	PWM0 channel 1 output/capture input.
	PSIO0_CH5	I/O	MFP12	PSIO 0 channel 5 input/output pin.
	UART2_RXD	I	MFP13	UART2 data receiver input pin.
	TM1	I/O	MFP14	Timer1 event counter input/toggle output pin.
INT1	I	MFP15	External interrupt 1 input pin.	
PB.5	PB.5	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH5	A	MFP1	EADC0 channel 5 analog input.
	ACMP1_N	A	MFP1	Analog comparator 1 negative input pin.

	Pin Name	Type	MFP	Description
	EBI_ADR0	O	MFP2	EBI address bus bit 0.
	I2C0_SCL	I/O	MFP6	I2C0 clock pin.
	USCI1_CTL0	I/O	MFP8	USCI1 control 0 pin.
	SC0_CLK	O	MFP9	Smart Card 0 clock pin.
	PWM0_CH0	I/O	MFP11	PWM0 channel 0 output/capture input.
	PSIO0_CH4	I/O	MFP12	PSIO 0 channel 4 input/output pin.
	UART2_TXD	O	MFP13	UART2 data transmitter output pin.
	TM0	I/O	MFP14	Timer0 event counter input/toggle output pin.
	INT0	I	MFP15	External interrupt 0 input pin.
PB.6	PB.6	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH6	A	MFP1	EADC0 channel 6 analog input.
	EBI_nWRH	O	MFP2	EBI high byte write enable output pin
	USCI1_DAT1	I/O	MFP4	USCI1 data 1 pin.
	UART1_RXD	I	MFP6	UART1 data receiver input pin.
	EBI_nCS1	O	MFP8	EBI chip select 1 output pin.
	BPWM1_CH5	I/O	MFP10	BPWM1 channel 5 output/capture input.
	PWM1_BRAKE1	I	MFP11	PWM1 Brake 1 input pin.
	PWM1_CH5	I/O	MFP12	PWM1 channel 5 output/capture input.
	INT4	I	MFP13	External interrupt 4 input pin.
	ACMP1_O	O	MFP15	Analog comparator 1 output pin.
PB.7	PB.7	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH7	A	MFP1	EADC0 channel 7 analog input.
	EBI_nWRL	O	MFP2	EBI low byte write enable output pin.
	USCI1_DAT0	I/O	MFP4	USCI1 data 0 pin.
	UART1_TXD	O	MFP6	UART1 data transmitter output pin.
	EBI_nCS0	O	MFP8	EBI chip select 0 output pin.
	BPWM1_CH4	I/O	MFP10	BPWM1 channel 4 output/capture input.
	PWM1_BRAKE0	I	MFP11	PWM1 Brake 0 input pin.
	PWM1_CH4	I/O	MFP12	PWM1 channel 4 output/capture input.
	INT5	I	MFP13	External interrupt 5 input pin.
	ACMP0_O	O	MFP15	Analog comparator 0 output pin.
PB.8	PB.8	I/O	MFP0	General purpose digital I/O pin.

	Pin Name	Type	MFP	Description
	EADC0_CH8	A	MFP1	EADC0 channel 8 analog input.
	EBI_ADR19	O	MFP2	EBI address bus bit 19.
	USCI1_CLK	I/O	MFP4	USCI1 clock pin.
	UART0_RXD	I	MFP5	UART0 data receiver input pin.
	UART1_nRTS	O	MFP6	UART1 request to Send output pin.
	I2C1_SMBSUS	O	MFP7	I2C1 SMBus SMBSUS pin (PMBus CONTROL pin)
	BPWM1_CH3	I/O	MFP10	BPWM1 channel 3 output/capture input.
PB.9	PB.9	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH9	A	MFP1	EADC0 channel 9 analog input.
	EBI_ADR18	O	MFP2	EBI address bus bit 18.
	USCI1_CTL1	I/O	MFP4	USCI1 control 1 pin.
	UART0_TXD	O	MFP5	UART0 data transmitter output pin.
	UART1_nCTS	I	MFP6	UART1 clear to Send input pin.
	I2C1_SMBAL	O	MFP7	I2C1 SMBus SMBALTER pin
BPWM1_CH2	I/O	MFP10	BPWM1 channel 2 output/capture input.	
PB.10	PB.10	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH10	A	MFP1	EADC0 channel 10 analog input.
	EBI_ADR17	O	MFP2	EBI address bus bit 17.
	USCI1_CTL0	I/O	MFP4	USCI1 control 0 pin.
	UART0_nRTS	O	MFP5	UART0 request to Send output pin.
	I2C1_SDA	I/O	MFP7	I2C1 data input/output pin.
	BPWM1_CH1	I/O	MFP10	BPWM1 channel 1 output/capture input.
PB.11	PB.11	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH11	A	MFP1	EADC0 channel 11 analog input.
	EBI_ADR16	O	MFP2	EBI address bus bit 16.
	UART0_nCTS	I	MFP5	UART0 clear to Send input pin.
	I2C1_SCL	I/O	MFP7	I2C1 clock pin.
	SPI0_I2SMCLK	I/O	MFP9	SPI0 I ² S master clock output pin
	BPWM1_CH0	I/O	MFP10	BPWM1 channel 0 output/capture input.
PB.12	PB.12	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH12	A	MFP1	EADC0 channel 12 analog input.
	DAC0_OUT	A	MFP1	DAC0 channel analog output.

	Pin Name	Type	MFP	Description
	ACMP0_P2	A	MFP1	Analog comparator 0 positive input 2 pin.
	ACMP1_P2	A	MFP1	Analog comparator 1 positive input 2 pin.
	EBI_AD15	I/O	MFP2	EBI address/data bus bit 15.
	SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
	USCIO_CLK	I/O	MFP5	USCIO clock pin.
	UART0_RXD	I	MFP6	UART0 data receiver input pin.
	PSIO0_CH3	I/O	MFP10	PSIO 0 channel 3 input/output pin.
	PWM1_CH3	I/O	MFP11	PWM1 channel 3 output/capture input.
	TM3_EXT	I/O	MFP13	Timer3 external capture input/toggle output pin.
PB.13	PB.13	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH13	A	MFP1	EADC0 channel 13 analog input.
	ACMP0_P3	A	MFP1	Analog comparator 0 positive input 3 pin.
	ACMP1_P3	A	MFP1	Analog comparator 1 positive input 3 pin.
	EBI_AD14	I/O	MFP2	EBI address/data bus bit 14.
	SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
	USCIO_DAT0	I/O	MFP5	USCIO data 0 pin.
	UART0_TXD	O	MFP6	UART0 data transmitter output pin.
	PSIO0_CH2	I/O	MFP10	PSIO 0 channel 2 input/output pin.
	PWM1_CH2	I/O	MFP11	PWM1 channel 2 output/capture input.
	TM2_EXT	I/O	MFP13	Timer2 external capture input/toggle output pin.
PB.14	PB.14	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH14	A	MFP1	EADC0 channel 14 analog input.
	EBI_AD13	I/O	MFP2	EBI address/data bus bit 13.
	SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
	USCIO_DAT1	I/O	MFP5	USCIO data 1 pin.
	UART0_nRTS	O	MFP6	UART0 request to Send output pin.
	PSIO0_CH1	I/O	MFP10	PSIO 0 channel 1 input/output pin.
	PWM1_CH1	I/O	MFP11	PWM1 channel 1 output/capture input.
	TM1_EXT	I/O	MFP13	Timer1 external capture input/toggle output pin.
	CLKO	O	MFP14	Clock Out
PB.15	PB.15	I/O	MFP0	General purpose digital I/O pin.
	EADC0_CH15	A	MFP1	EADC0 channel 15 analog input.

	Pin Name	Type	MFP	Description
	EBI_AD12	I/O	MFP2	EBI address/data bus bit 12.
	SPI0_SS	I/O	MFP4	SPI0 slave select pin.
	USCI0_CTL1	I/O	MFP5	USCI0 control 1 pin.
	UART0_nCTS	I	MFP6	UART0 clear to Send input pin.
	PSIO0_CH0	I/O	MFP10	PSIO 0 channel 0 input/output pin.
	PWM1_CH0	I/O	MFP11	PWM1 channel 0 output/capture input.
	TM0_EXT	I/O	MFP13	Timer0 external capture input/toggle output pin.
	PWM0_BRAKE1	I	MFP15	PWM0 Brake 1 input pin.
PC.0	PC.0	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD0	I/O	MFP2	EBI address/data bus bit 0.
	QSPIO_MOSI0	I/O	MFP4	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
	UART2_RXD	I	MFP8	UART2 data receiver input pin.
	I2C0_SDA	I/O	MFP9	I2C0 data input/output pin.
	PWM1_CH5	I/O	MFP12	PWM1 channel 5 output/capture input.
	USCI2_DAT1	I/O	MFP13	USCI2 data 1 pin.
	ACMP1_O	O	MFP14	Analog comparator 1 output pin.
PC.1	PC.1	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD1	I/O	MFP2	EBI address/data bus bit 1.
	QSPIO_MISO0	I/O	MFP4	Quad SPI0 MISO0 (Master In, Slave Out) pin.
	UART2_TXD	O	MFP8	UART2 data transmitter output pin.
	I2C0_SCL	I/O	MFP9	I2C0 clock pin.
	PWM1_CH4	I/O	MFP12	PWM1 channel 4 output/capture input.
	USCI2_DAT0	I/O	MFP13	USCI2 data 0 pin.
	ACMP0_O	O	MFP14	Analog comparator 0 output pin.
PC.2	PC.2	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD2	I/O	MFP2	EBI address/data bus bit 2.
	QSPIO_CLK	I/O	MFP4	Quad SPI0 serial clock pin.
	UART2_nCTS	I	MFP8	UART2 clear to Send input pin.
	I2C0_SMBSUS	O	MFP9	I2C0 SMBus SMBSUS pin (PMBus CONTROL pin)
	PWM1_CH3	I/O	MFP12	PWM1 channel 3 output/capture input.
	USCI2_CLK	I/O	MFP13	USCI2 clock pin.
	PSIO0_CH3	I/O	MFP15	PSIO 0 channel 3 input/output pin.

	Pin Name	Type	MFP	Description
PC.3	PC.3	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD3	I/O	MFP2	EBI address/data bus bit 3.
	QSPIO_SS	I/O	MFP4	Quad SPI0 slave select pin.
	UART2_nRTS	O	MFP8	UART2 request to Send output pin.
	I2C0_SMBAL	O	MFP9	I2C0 SMBus SMBALTER pin
	PWM1_CH2	I/O	MFP12	PWM1 channel 2 output/capture input.
	USCI2_CTL0	I/O	MFP13	USCI2 control 0 pin.
	PSIO0_CH2	I/O	MFP15	PSIO 0 channel 2 input/output pin.
PC.4	PC.4	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD4	I/O	MFP2	EBI address/data bus bit 4.
	QSPIO_MOSI1	I/O	MFP4	Quad SPI0 MOSI1 (Master Out, Slave In) pin.
	UART2_RXD	I	MFP8	UART2 data receiver input pin.
	I2C1_SDA	I/O	MFP9	I2C1 data input/output pin.
	PWM1_CH1	I/O	MFP12	PWM1 channel 1 output/capture input.
	USCI2_CTL1	I/O	MFP13	USCI2 control 1 pin.
	PSIO0_CH1	I/O	MFP15	PSIO 0 channel 1 input/output pin.
PC.5	PC.5	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD5	I/O	MFP2	EBI address/data bus bit 5.
	QSPIO_MISO1	I/O	MFP4	Quad SPI0 MISO1 (Master In, Slave Out) pin.
	UART2_TXD	O	MFP8	UART2 data transmitter output pin.
	I2C1_SCL	I/O	MFP9	I2C1 clock pin.
	PWM1_CH0	I/O	MFP12	PWM1 channel 0 output/capture input.
	PSIO0_CH0	I/O	MFP15	PSIO 0 channel 0 input/output pin.
PC.6	PC.6	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD8	I/O	MFP2	EBI address/data bus bit 8.
	UART0_nRTS	O	MFP7	UART0 request to Send output pin.
	I2C1_SMBUS	O	MFP8	I2C1 SMBus SMBUS pin (PMBus CONTROL pin)
	PWM1_CH3	I/O	MFP11	PWM1 channel 3 output/capture input.
	BPWM1_CH1	I/O	MFP12	BPWM1 channel 1 output/capture input.
	TM1	I/O	MFP14	Timer1 event counter input/toggle output pin.
	INT2	I	MFP15	External interrupt 2 input pin.
PC.7	PC.7	I/O	MFP0	General purpose digital I/O pin.

	Pin Name	Type	MFP	Description
	EBI_AD9	I/O	MFP2	EBI address/data bus bit 9.
	UART0_nCTS	I	MFP7	UART0 clear to Send input pin.
	I2C1_SMBAL	O	MFP8	I2C1 SMBus SMBALTER pin
	PWM1_CH2	I/O	MFP11	PWM1 channel 2 output/capture input.
	BPWM1_CH0	I/O	MFP12	BPWM1 channel 0 output/capture input.
	TM0	I/O	MFP14	Timer0 event counter input/toggle output pin.
	INT3	I	MFP15	External interrupt 3 input pin.
PC.8	PC.8	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR16	O	MFP2	EBI address bus bit 16.
	I2C0_SDA	I/O	MFP4	I2C0 data input/output pin.
	UART1_RXD	I	MFP8	UART1 data receiver input pin.
	PWM1_CH1	I/O	MFP11	PWM1 channel 1 output/capture input.
	BPWM1_CH4	I/O	MFP12	BPWM1 channel 4 output/capture input.
PC.9	PC.9	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR7	O	MFP2	EBI address bus bit 7.
	PWM1_CH3	I/O	MFP12	PWM1 channel 3 output/capture input.
PC.10	PC.10	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR6	O	MFP2	EBI address bus bit 6.
	PWM1_CH2	I/O	MFP12	PWM1 channel 2 output/capture input.
PC.11	PC.11	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR5	O	MFP2	EBI address bus bit 5.
	UART0_RXD	I	MFP3	UART0 data receiver input pin.
	I2C0_SDA	I/O	MFP4	I2C0 data input/output pin.
	PWM1_CH1	I/O	MFP12	PWM1 channel 1 output/capture input.
	ACMP1_O	O	MFP14	Analog comparator 1 output pin.
PC.12	PC.12	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR4	O	MFP2	EBI address bus bit 4.
	UART0_TXD	O	MFP3	UART0 data transmitter output pin.
	I2C0_SCL	I/O	MFP4	I2C0 clock pin.
	SC0_nCD	I	MFP9	Smart Card 0 card detect pin.
	PWM1_CH0	I/O	MFP12	PWM1 channel 0 output/capture input.
	ACMP0_O	O	MFP14	Analog comparator 0 output pin.

	Pin Name	Type	MFP	Description
PC.14	PC.14	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.
	SPI0_I2SMCLK	I/O	MFP4	SPI0 I ² S master clock output pin
	USCIO_CTL0	I/O	MFP5	USCIO control 0 pin.
	QSPI0_CLK	I/O	MFP6	Quad SPI0 serial clock pin.
	USCI2_CLK	I/O	MFP7	USCI2 clock pin.
	TM1	I/O	MFP13	Timer1 event counter input/toggle output pin.
PD.0	PD.0	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD13	I/O	MFP2	EBI address/data bus bit 13.
	USCIO_CLK	I/O	MFP3	USCIO clock pin.
	SPI0_MOSI	I/O	MFP4	SPI0 MOSI (Master Out, Slave In) pin.
	TM2	I/O	MFP14	Timer2 event counter input/toggle output pin.
PD.1	PD.1	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD12	I/O	MFP2	EBI address/data bus bit 12.
	USCIO_DAT0	I/O	MFP3	USCIO data 0 pin.
	SPI0_MISO	I/O	MFP4	SPI0 MISO (Master In, Slave Out) pin.
PD.2	PD.2	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.
	USCIO_DAT1	I/O	MFP3	USCIO data 1 pin.
	SPI0_CLK	I/O	MFP4	SPI0 serial clock pin.
	UART0_RXD	I	MFP9	UART0 data receiver input pin.
PD.3	PD.3	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD10	I/O	MFP2	EBI address/data bus bit 10.
	USCIO_CTL1	I/O	MFP3	USCIO control 1 pin.
	SPI0_SS	I/O	MFP4	SPI0 slave select pin.
	USCI1_CTL0	I/O	MFP6	USCI1 control 0 pin.
	UART0_TXD	O	MFP9	UART0 data transmitter output pin.
PD.4	PD.4	I/O	MFP0	General purpose digital I/O pin.
	USCIO_CTL0	I/O	MFP3	USCIO control 0 pin.
	I2C1_SDA	I/O	MFP4	I2C1 data input/output pin.
	USCI1_CTL1	I/O	MFP6	USCI1 control 1 pin.
	PSIO0_CH7	I/O	MFP10	PSIO 0 channel 7 input/output pin.

	Pin Name	Type	MFP	Description
PD.5	PD.5	I/O	MFP0	General purpose digital I/O pin.
	I2C1_SCL	I/O	MFP4	I2C1 clock pin.
	USCI1_DAT0	I/O	MFP6	USCI1 data 0 pin.
	PSIO0_CH6	I/O	MFP10	PSIO 0 channel 6 input/output pin.
PD.6	PD.6	I/O	MFP0	General purpose digital I/O pin.
	UART1_RXD	I	MFP3	UART1 data receiver input pin.
	I2C0_SDA	I/O	MFP4	I2C0 data input/output pin.
	USCI1_DAT1	I/O	MFP6	USCI1 data 1 pin.
	PSIO0_CH5	I/O	MFP10	PSIO 0 channel 5 input/output pin.
PD.7	PD.7	I/O	MFP0	General purpose digital I/O pin.
	UART1_TXD	O	MFP3	UART1 data transmitter output pin.
	I2C0_SCL	I/O	MFP4	I2C0 clock pin.
	USCI1_CLK	I/O	MFP6	USCI1 clock pin.
	PSIO0_CH4	I/O	MFP10	PSIO 0 channel 4 input/output pin.
PD.8	PD.8	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD6	I/O	MFP2	EBI address/data bus bit 6.
	UART2_nRTS	O	MFP4	UART2 request to Send output pin.
	PSIO0_CH3	I/O	MFP10	PSIO 0 channel 3 input/output pin.
PD.9	PD.9	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD7	I/O	MFP2	EBI address/data bus bit 7.
	UART2_nCTS	I	MFP4	UART2 clear to Send input pin.
	PSIO0_CH2	I/O	MFP10	PSIO 0 channel 2 input/output pin.
PD.10	PD.10	I/O	MFP0	General purpose digital I/O pin.
	EBI_nCS2	O	MFP2	EBI chip select 2 output pin.
	UART1_RXD	I	MFP3	UART1 data receiver input pin.
PD.11	PD.11	I/O	MFP0	General purpose digital I/O pin.
	EBI_nCS1	O	MFP2	EBI chip select 1 output pin.
	UART1_TXD	O	MFP3	UART1 data transmitter output pin.
PD.12	PD.12	I/O	MFP0	General purpose digital I/O pin.
	EBI_nCS0	O	MFP2	EBI chip select 0 output pin.
	UART2_RXD	I	MFP7	UART2 data receiver input pin.
	BPWM0_CH5	I/O	MFP9	BPWM0 channel 5 output/capture input.

	Pin Name	Type	MFP	Description
	CLKO	O	MFP13	Clock Out
	EADC0_ST	I	MFP14	EADC0 external trigger input.
	INT5	I	MFP15	External interrupt 5 input pin.
PD.13	PD.13	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD10	I/O	MFP2	EBI address/data bus bit 10.
	SPI0_I2SMCLK	I/O	MFP4	SPI0 I ² S master clock output pin
	USCI2_CTL0	I/O	MFP8	USCI2 control 0 pin.
PD.15	PD.15	I/O	MFP0	General purpose digital I/O pin.
	PSIO0_CH7	I/O	MFP11	PSIO 0 channel 7 input/output pin.
	PWM0_CH5	I/O	MFP12	PWM0 channel 5 output/capture input.
	TM3	I/O	MFP14	Timer3 event counter input/toggle output pin.
	INT1	I	MFP15	External interrupt 1 input pin.
PE.0	PE.0	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD11	I/O	MFP2	EBI address/data bus bit 11.
	QSPI0_MOSI0	I/O	MFP3	Quad SPI0 MOSI0 (Master Out, Slave In) pin.
	I2C1_SDA	I/O	MFP8	I2C1 data input/output pin.
	USCI2_DAT0	I/O	MFP10	USCI2 data 0 pin.
PE.1	PE.1	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD10	I/O	MFP2	EBI address/data bus bit 10.
	QSPI0_MISO0	I/O	MFP3	Quad SPI0 MISO0 (Master In, Slave Out) pin.
	I2C1_SCL	I/O	MFP8	I2C1 clock pin.
	USCI2_DAT1	I/O	MFP10	USCI2 data 1 pin.
PE.2	PE.2	I/O	MFP0	General purpose digital I/O pin.
	EBI_ALE	O	MFP2	EBI address latch enable output pin.
	SC0_CLK	O	MFP6	Smart Card 0 clock pin.
	USCI0_CLK	I/O	MFP7	USCI0 clock pin.
	USCI2_CTL0	I/O	MFP10	USCI2 control 0 pin.
	PWM0_CH5	I/O	MFP12	PWM0 channel 5 output/capture input.
	BPWM0_CH0	I/O	MFP13	BPWM0 channel 0 output/capture input.
PE.3	PE.3	I/O	MFP0	General purpose digital I/O pin.
	EBI_MCLK	O	MFP2	EBI external clock output pin.
	SC0_DAT	I/O	MFP6	Smart Card 0 data pin.

	Pin Name	Type	MFP	Description
	USCIO_DAT0	I/O	MFP7	USCIO data 0 pin.
	PWM0_CH4	I/O	MFP12	PWM0 channel 4 output/capture input.
	BPWM0_CH1	I/O	MFP13	BPWM0 channel 1 output/capture input.
PE.4	PE.4	I/O	MFP0	General purpose digital I/O pin.
	EBI_nWR	O	MFP2	EBI write enable output pin.
	SC0_RST	O	MFP6	Smart Card 0 reset pin.
	USCIO_DAT1	I/O	MFP7	USCIO data 1 pin.
	PSIO0_CH3	I/O	MFP10	PSIO 0 channel 3 input/output pin.
	PWM0_CH3	I/O	MFP12	PWM0 channel 3 output/capture input.
PE.5	BPWM0_CH2	I/O	MFP13	BPWM0 channel 2 output/capture input.
	PE.5	I/O	MFP0	General purpose digital I/O pin.
	EBI_nRD	O	MFP2	EBI read enable output pin.
	SC0_PWR	O	MFP6	Smart Card 0 power pin.
	USCIO_CTL1	I/O	MFP7	USCIO control 1 pin.
	PSIO0_CH2	I/O	MFP10	PSIO 0 channel 2 input/output pin.
	PWM0_CH2	I/O	MFP12	PWM0 channel 2 output/capture input.
PE.6	BPWM0_CH3	I/O	MFP13	BPWM0 channel 3 output/capture input.
	PE.6	I/O	MFP0	General purpose digital I/O pin.
	SC0_nCD	I	MFP6	Smart Card 0 card detect pin.
	USCIO_CTL0	I/O	MFP7	USCIO control 0 pin.
	PSIO0_CH1	I/O	MFP10	PSIO 0 channel 1 input/output pin.
	PWM0_CH1	I/O	MFP12	PWM0 channel 1 output/capture input.
PE.7	BPWM0_CH4	I/O	MFP13	BPWM0 channel 4 output/capture input.
	PE.7	I/O	MFP0	General purpose digital I/O pin.
	PSIO0_CH0	I/O	MFP10	PSIO 0 channel 0 input/output pin.
	PWM0_CH0	I/O	MFP12	PWM0 channel 0 output/capture input.
PE.8	BPWM0_CH5	I/O	MFP13	BPWM0 channel 5 output/capture input.
	PE.8	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR10	O	MFP2	EBI address bus bit 10.
	USCI1_CTL1	I/O	MFP6	USCI1 control 1 pin.
	UART2_TXD	O	MFP7	UART2 data transmitter output pin.
	PWM0_CH0	I/O	MFP10	PWM0 channel 0 output/capture input.

	Pin Name	Type	MFP	Description
	PWM0_BRAKE0	I	MFP11	PWM0 Brake 0 input pin.
PE.9	PE.9	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR11	O	MFP2	EBI address bus bit 11.
	USCI1_CTL0	I/O	MFP6	USCI1 control 0 pin.
	UART2_RXD	I	MFP7	UART2 data receiver input pin.
	PWM0_CH1	I/O	MFP10	PWM0 channel 1 output/capture input.
	PWM0_BRAKE1	I	MFP11	PWM0 Brake 1 input pin.
PE.10	PE.10	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR12	O	MFP2	EBI address bus bit 12.
	USCI1_DAT0	I/O	MFP6	USCI1 data 0 pin.
	PWM0_CH2	I/O	MFP10	PWM0 channel 2 output/capture input.
	PWM1_BRAKE0	I	MFP11	PWM1 Brake 0 input pin.
PE.11	PE.11	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR13	O	MFP2	EBI address bus bit 13.
	USCI1_DAT1	I/O	MFP6	USCI1 data 1 pin.
	UART1_nCTS	I	MFP8	UART1 clear to Send input pin.
	PWM0_CH3	I/O	MFP10	PWM0 channel 3 output/capture input.
	PWM1_BRAKE1	I	MFP11	PWM1 Brake 1 input pin.
PE.12	PE.12	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR14	O	MFP2	EBI address bus bit 14.
	USCI1_CLK	I/O	MFP6	USCI1 clock pin.
	UART1_nRTS	O	MFP8	UART1 request to Send output pin.
	PWM0_CH4	I/O	MFP10	PWM0 channel 4 output/capture input.
PE.13	PE.13	I/O	MFP0	General purpose digital I/O pin.
	EBI_ADR15	O	MFP2	EBI address bus bit 15.
	I2C0_SCL	I/O	MFP4	I2C0 clock pin.
	UART1_TXD	O	MFP8	UART1 data transmitter output pin.
	PWM0_CH5	I/O	MFP10	PWM0 channel 5 output/capture input.
	PWM1_CH0	I/O	MFP11	PWM1 channel 0 output/capture input.
	BPWM1_CH5	I/O	MFP12	BPWM1 channel 5 output/capture input.
PE.14	PE.14	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD8	I/O	MFP2	EBI address/data bus bit 8.

	Pin Name	Type	MFP	Description
	UART2_TXD	O	MFP3	UART2 data transmitter output pin.
	PSIO0_CH0	I/O	MFP10	PSIO 0 channel 0 input/output pin.
PE.15	PE.15	I/O	MFP0	General purpose digital I/O pin.
	EBI_AD9	I/O	MFP2	EBI address/data bus bit 9.
	UART2_RXD	I	MFP3	UART2 data receiver input pin.
	PSIO0_CH1	I/O	MFP10	PSIO 0 channel 1 input/output pin.
PF.0	PF.0	I/O	MFP0	General purpose digital I/O pin.
	UART1_TXD	O	MFP2	UART1 data transmitter output pin.
	I2C1_SCL	I/O	MFP3	I2C1 clock pin.
	UART0_TXD	O	MFP4	UART0 data transmitter output pin.
	BPWM1_CH0	I/O	MFP12	BPWM1 channel 0 output/capture input.
	ICE_DAT	O	MFP14	Serial wired debugger data pin.
PF.1	PF.1	I/O	MFP0	General purpose digital I/O pin.
	UART1_RXD	I	MFP2	UART1 data receiver input pin.
	I2C1_SDA	I/O	MFP3	I2C1 data input/output pin.
	UART0_RXD	I	MFP4	UART0 data receiver input pin.
	BPWM1_CH1	I/O	MFP12	BPWM1 channel 1 output/capture input.
	ICE_CLK	I	MFP14	Serial wired debugger clock pin.
PF.2	PF.2	I/O	MFP0	General purpose digital I/O pin.

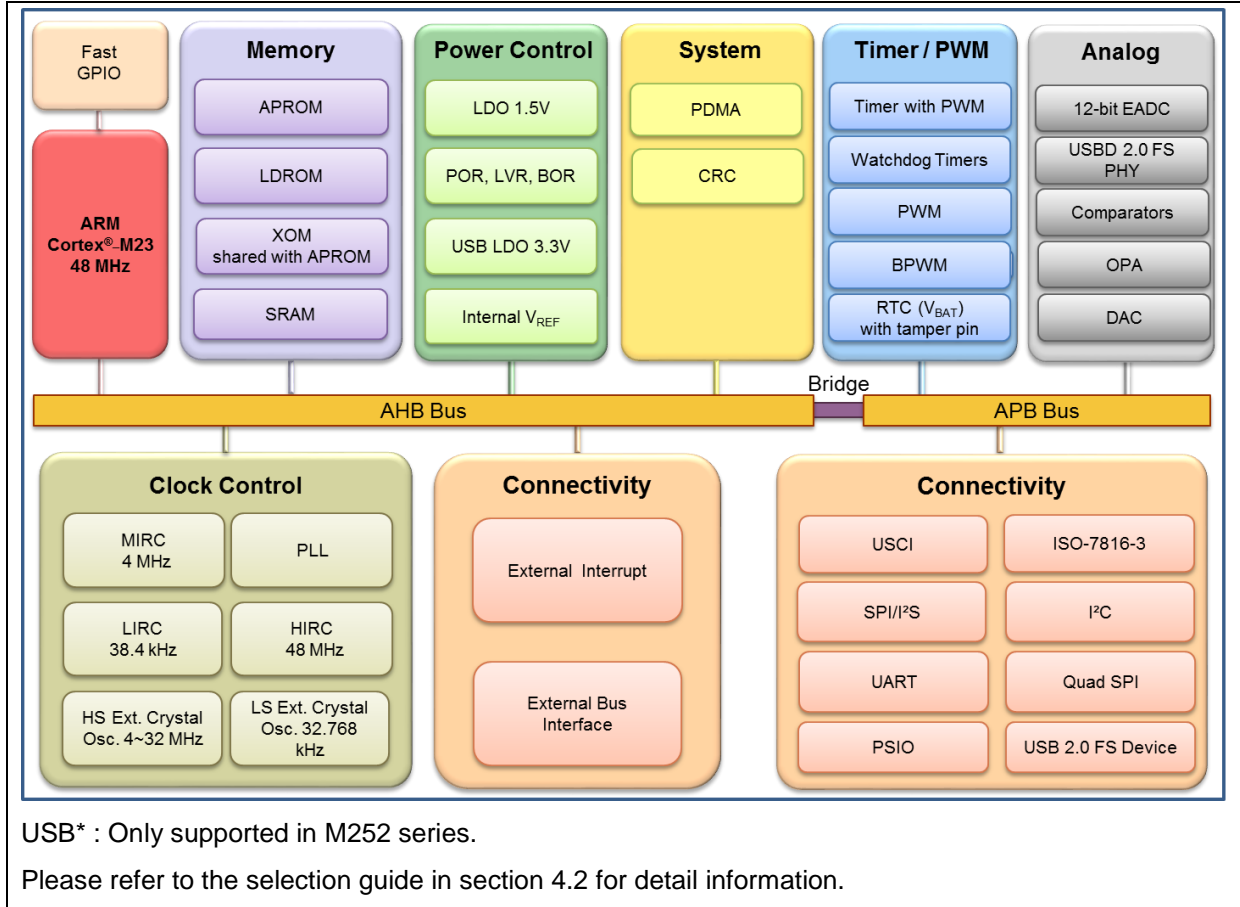

Figure 5.1-1 M251/M252 Block Diagram

6 FUNCTIONAL DESCRIPTION

6.1 Arm® Cortex®-M23 Core

The Cortex®-M23 processor is a low gate count, two-stage, and highly energy efficient 32-bit RISC processor, which has an AMBA AHB5 interface supporting Arm® TrustZone® technology, a debug access port supporting serial wire debug and single-cycle I/O ports. It has an NVIC component and MPU for memory-protection functionality. The processor also supports Security Extension. The NuMicro® M251/M252 series is embedded with Cortex®-M23 processor. Figure 6.1-1 shows the functional controller of the processor.

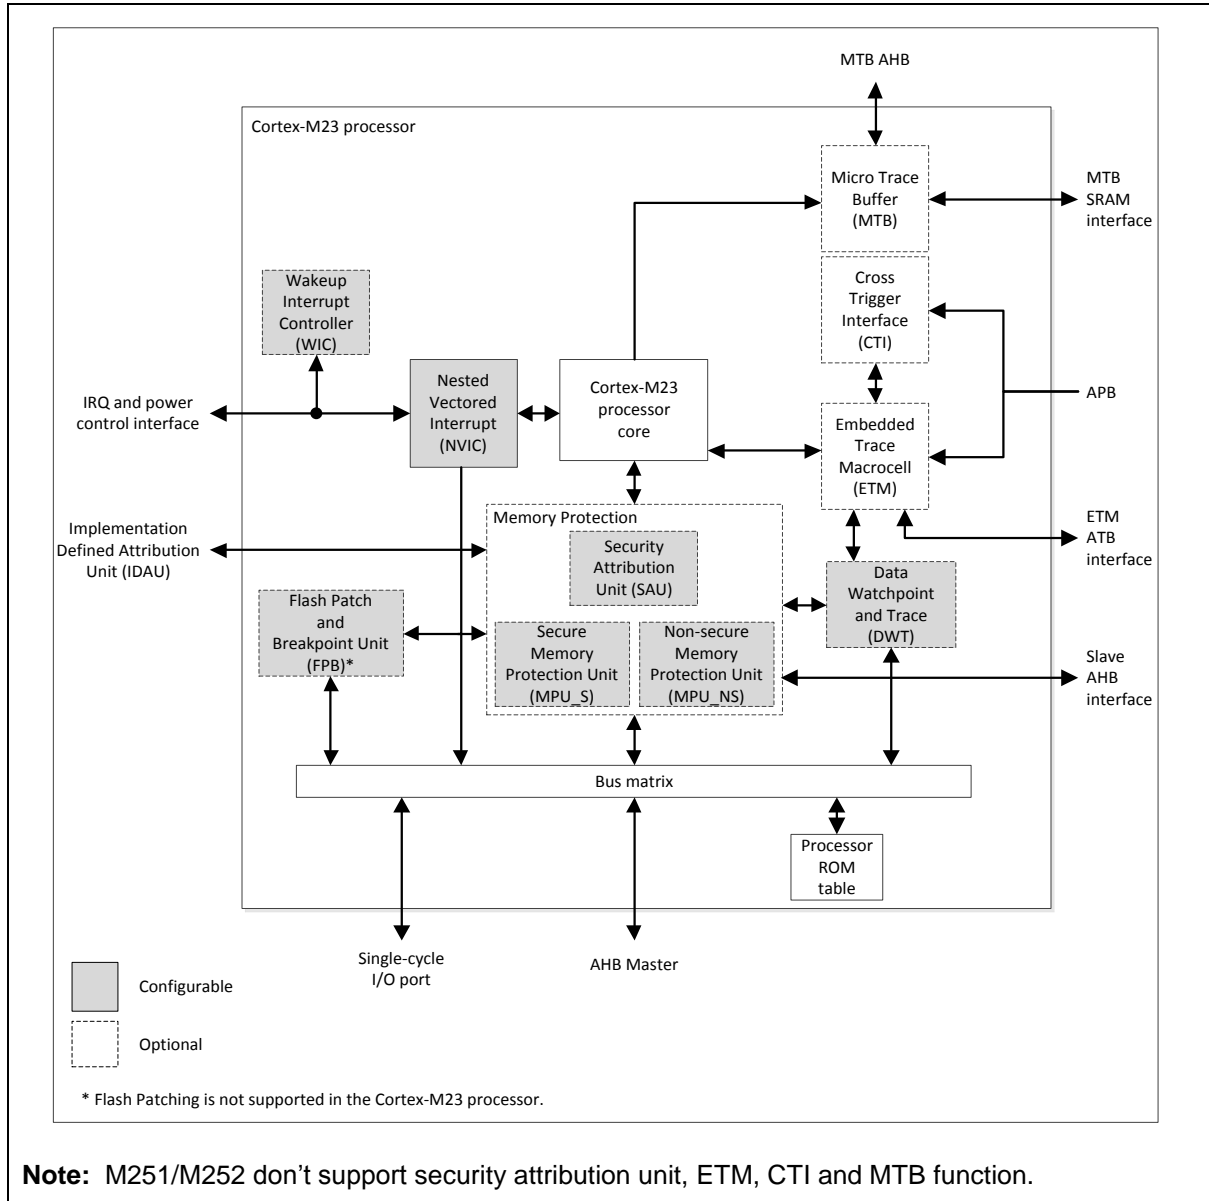

Figure 6.1-1 Cortex®-M23 Block Diagram

Cortex[®]-M23 processor features:

- Armv8-M Baseline architecture.
- Armv8-M Baseline Thumb[®]-2 instruction set that combines high code density with 32-bit performance.
- Support for single-cycle I/O access.
- Power control optimization of system components.
- Integrated sleep modes for low power consumption.
- Optimized code fetching for reduced Flash and ROM power consumption.
- A 32-bit Single cycle Hardware multiplier.
- A 32-bit Hardware divider.
- Deterministic, high-performance interrupt handling for time-critical applications.
- Deterministic instruction cycle timing.
- Support for system level debug authentication.
- Support for Arm[®] Debug Interface Architecture ADIv5.1 Serial Wire Debug (SWD).
- ETM for instruction trace.
- Separated privileged and unprivileged modes.
- Security Extension supporting a Secure and a Non-secure state.
- Protected Memory System Architecture (PMSAv8) Memory Protection Units (MPUs) for both Secure and Non-secure states.
- Security Attribution Unit (SAU).
- SysTick timers for both Secure and Non-secure states.
- A Nested Vectored Interrupt Controller (NVIC) closely integrated with the processor with up to 240 interrupts.

6.2 System Manager

6.2.1 Overview

System management includes the following sections:

- System Reset
- System Power Distribution
- SRAM Memory Organization
- System Timer (SysTick)
- Nested Vectored Interrupt Controller (NVIC)
- System Control register

6.2.2 System Reset

The system reset can be issued by one of the events listed below. These reset event flags can be read from SYS_RSTSTS register to determine the reset source. Hardware reset sources are from peripheral signals. Software reset can trigger reset through setting control registers.

- Hardware Reset Sources
 - Power-on Reset
 - Low level on the nRESET pin with glitch filter time 24us
 - Watchdog Time-out Reset and Window Watchdog Reset (WDT/WWDT Reset)
 - Low Voltage Reset (LVR)
 - Brown-out Detector Reset (BOD Reset)
 - CPU Lockup Reset
- Software Reset Sources
 - CHIP Reset will reset whole chip by writing 1 to CHIPRST (SYS_IPRST0[0])
 - MCU Reset to reboot but keeping the booting setting from APROM or LDROM by writing 1 to SYSRESETREQ (AIRCR[2])
 - CPU Reset for Cortex®-M23 core Only by writing 1 to CPURST (SYS_IPRST0[1])

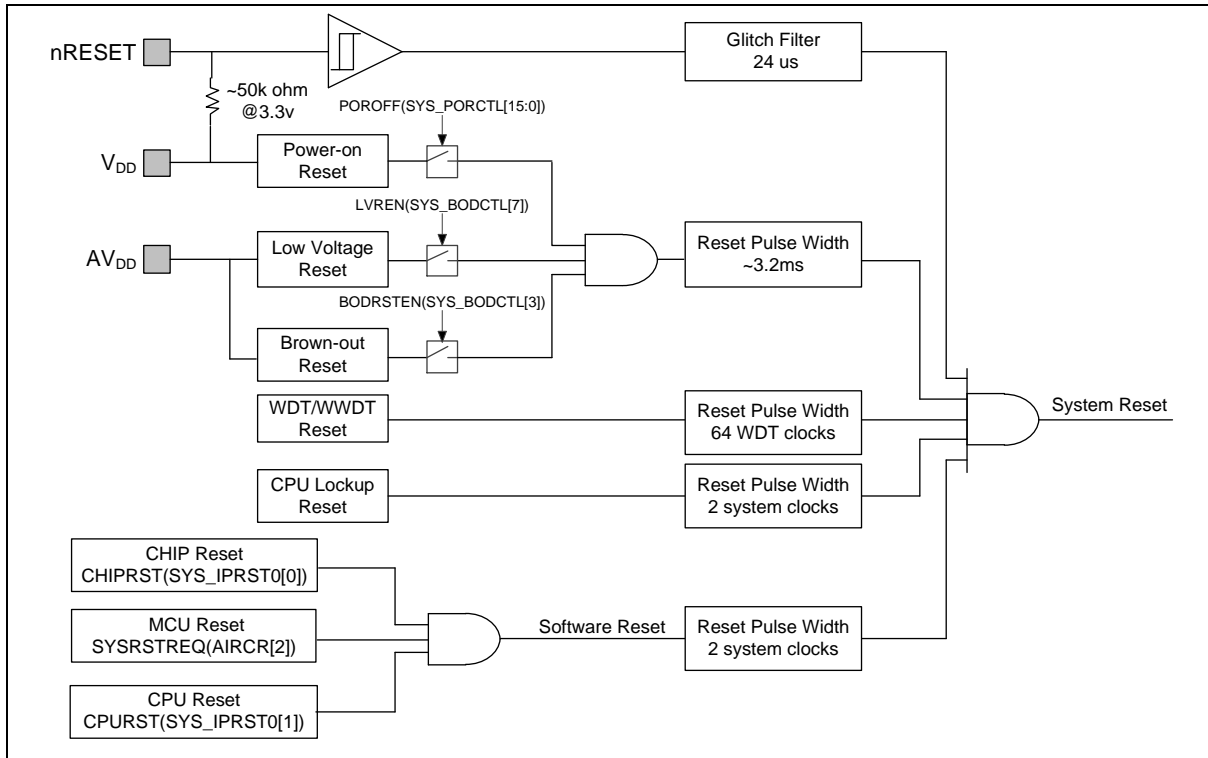

Figure 6.2-1 System Reset Sources

There are a total of 9 reset sources in the NuMicro[®] family. In general, CPU reset is used to reset Cortex[®]-M23 only; the other reset sources will reset Cortex[®]-M23 and all peripherals. However, there are small differences between each reset source and they are listed in Table 6.2-1.

Reset Sources Register	POR	NRESET	WDT	LVR	BOD	Lockup	CHIP	MCU	CPU
SYS_RSTSTS	Bit 0 = 1	Bit 1 = 1	Bit 2 = 1	Bit 3 = 1	Bit 4 = 1	Bit 8 = 1	Bit 0 = 1	Bit 5 = 1	Bit 7 = 1
CHIPRST (SYS_IPRST0[0])	0x0	-	-	-	-	-	-	-	-

Other Peripheral Registers	Reset Value								
FMC Registers	Reset Value								
Note: '-' means that the value of register keeps original setting.									

Table 6.2-1 Reset Value of Registers

6.2.2.1 nRESET Reset

The nRESET reset means to generate a reset signal by pulling low nRESET pin, which is an asynchronous reset input pin and can be used to reset system at any time. When the nRESET voltage is lower than $0.2 V_{DD}$ and the state keeps longer than 24 us (glitch filter), chip will be reset. The nRESET reset will control the chip in reset state until the nRESET voltage rises above $0.7 V_{DD}$ and the state keeps longer than 24 us (glitch filter). The PINRF(SYS_RSTSTS[1]) will be set to 1 if the previous reset source is nRESET reset. Table 6.2-2 shows the nRESET reset waveform.

Figure 6.2-2 nRESET Reset Waveform

6.2.2.2 Power-on Reset (POR)

The Power-on reset (POR) is used to generate a stable system reset signal and forces the system to be reset when power-on to avoid unexpected behavior of MCU. When applying the power to MCU, the POR module will detect the rising voltage and generate reset signal to system until the voltage is ready for MCU operation. At POR reset, the PORF(SYS_RSTSTS[0]) will be set to 1 to indicate there is a POR reset event. The PORF(SYS_RSTSTS[0]) bit can be cleared by writing 1 to it. Figure 6.2-3 shows the power-on reset waveform.

Figure 6.2-3 Power-on Reset (POR) Waveform

6.2.2.3 Low Voltage Reset (LVR)

If the Low Voltage Reset function is enabled by setting the Low Voltage Reset Enable Bit LVREN (SYS_BODCTL[7]) to 1, after 200us delay, LVR detection circuit will be stable and the LVR function will be active. Then LVR function will detect AV_{DD} during system operation. When the AV_{DD} voltage is lower than V_{LVR} and the state keeps longer than De-glitch time set by LVRDGSEL (SYS_BODCTL[14:12]), chip will be reset. The LVR reset will control the chip in reset state until the AV_{DD} voltage rises above V_{LVR} and the state keeps longer than De-glitch time set by LVRDGSEL (SYS_BODCTL[14:12]). The

default setting of Low Voltage Reset is enabled without De-glitch function. Figure 6.2-4 shows the Low Voltage Reset waveform.

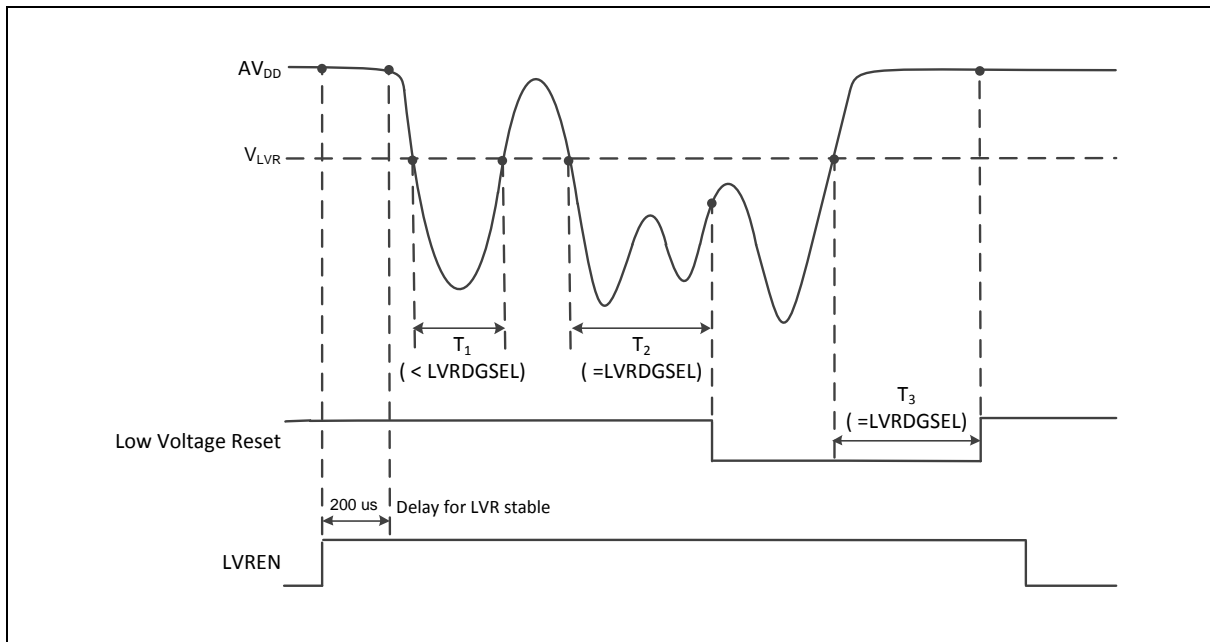

Figure 6.2-4 Low Voltage Reset (LVR) Waveform

6.2.2.4 Brown-out Detector Reset (BOD Reset)

If the Brown-out Detector (BOD) function is enabled by setting the Brown-out Detector Enable Bit BODEN (SYS_BODCTL[0]), Brown-out Detector function will detect AV_{DD} during system operation. When the AV_{DD} voltage is lower than V_{BOD} which is decided by BODEN and BODVL (SYS_BODCTL[18:16]) and the state keeps longer than De-glitch time set by BODDGSEL (SYS_BODCTL[10:8]), chip will be reset. The BOD reset will control the chip in reset state until the AV_{DD} voltage rises above V_{BOD} and the state keeps longer than De-glitch time set by BODDGSEL. The default value of BODEN, BODVL and BODRSTEN (SYS_BODCTL[3]) is set by Flash controller user configuration register CBODEN (CONFIG0 [19]), CBOV (CONFIG0 [23:21]) and CBORST(CONFIG0[20]) respectively. User can determine the initial BOD setting by setting the CONFIG0 register. Figure 6.2-5 shows the Brown-out Detector waveform.

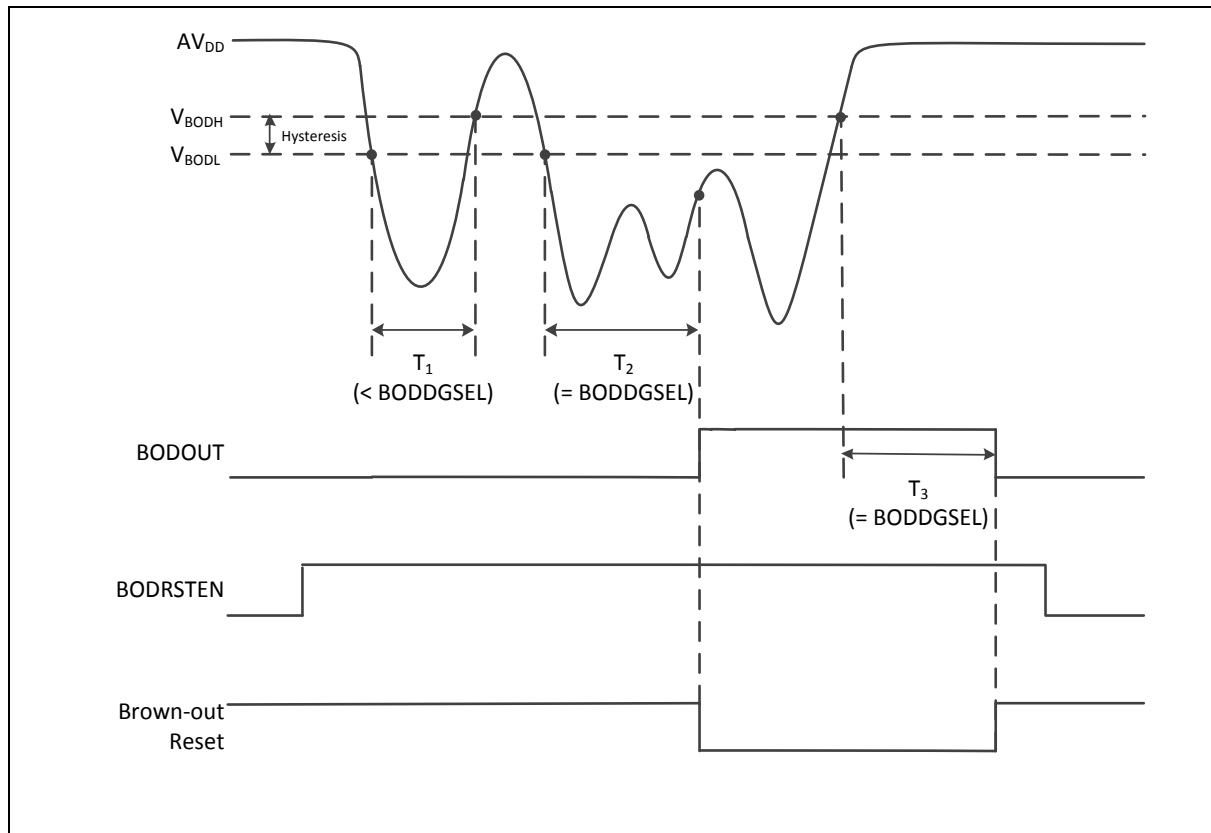

Figure 6.2-5 Brown-out Detector (BOD) Waveform

6.2.2.5 Watchdog Timer Reset (WDT)

In most industrial applications, system reliability is very important. To automatically recover the MCU from failure status is one way to improve system reliability. The watchdog timer(WDT) is widely used to check if the system works fine. If the MCU is crashed or out of control, it may cause the watchdog time-out. User may decide to enable system reset during watchdog time-out to recover the system and take action for the system crash/out-of-control after reset.

Software can check if the reset is caused by watchdog time-out to indicate the previous reset is a watchdog reset and handle the failure of MCU after watchdog time-out reset by checking WDTRF(SYS_RSTSTS[2]).

6.2.2.6 CPU Lockup Reset

CPU enters lockup status after CPU produces hardfault at hardfault handler and chip gives immediate indication of seriously errant kernel software. This is the result of the CPU being locked because of an unrecoverable exception following the activation of the processor's built in system state protection hardware. When chip enters debug mode, the CPU lockup reset will be ignored.

6.2.2.7 CPU Reset, CHIP Reset and MCU Reset

The CPU Reset means only Cortex[®]-M23 core is reset and all other peripherals remain the same status after CPU reset. User can set the CPURST(SYS_IPRST0[1]) to 1 to assert the CPU Reset signal.

The CHIP Reset is same with Power-on Reset. The CPU and all peripherals are reset and BS(FMC_ISPCTL[1]) bit is automatically reloaded from CONFIG0 setting. User can set the CHIPRST(SYS_IPRST0[1]) to 1 to assert the CHIP Reset signal.

The MCU Reset is similar with CHIP Reset. The difference is that BS(FMC_ISPCTL[1]) will not be reloaded from CONFIG0 setting and keep its original software setting for booting from APROM or LDROM. User can set the SYSRESETREQ(AIRCR[2]) to 1 to assert the MCU Reset.

6.2.3 System Power Distribution

In this chip, power distribution is divided into four segments:

- Analog power from AV_{DD} and AV_{SS} provides the power for analog components operation.
- Digital power from V_{DD} and V_{SS} supplies the power to the internal regulator which provides a fixed 1.5V power for digital operation and I/O pins.
- USB transceiver power from V_{BUS} offers the power for operating the USB transceiver.
- RTC power from regulator uninterrupted power domain provides, the power for RTC and 20 bytes backup registers.

Analog power (AV_{DD}) should be the same voltage level of the digital power (V_{DD}). Figure 6.2-6 shows the power distribution of the M251/M252 series.

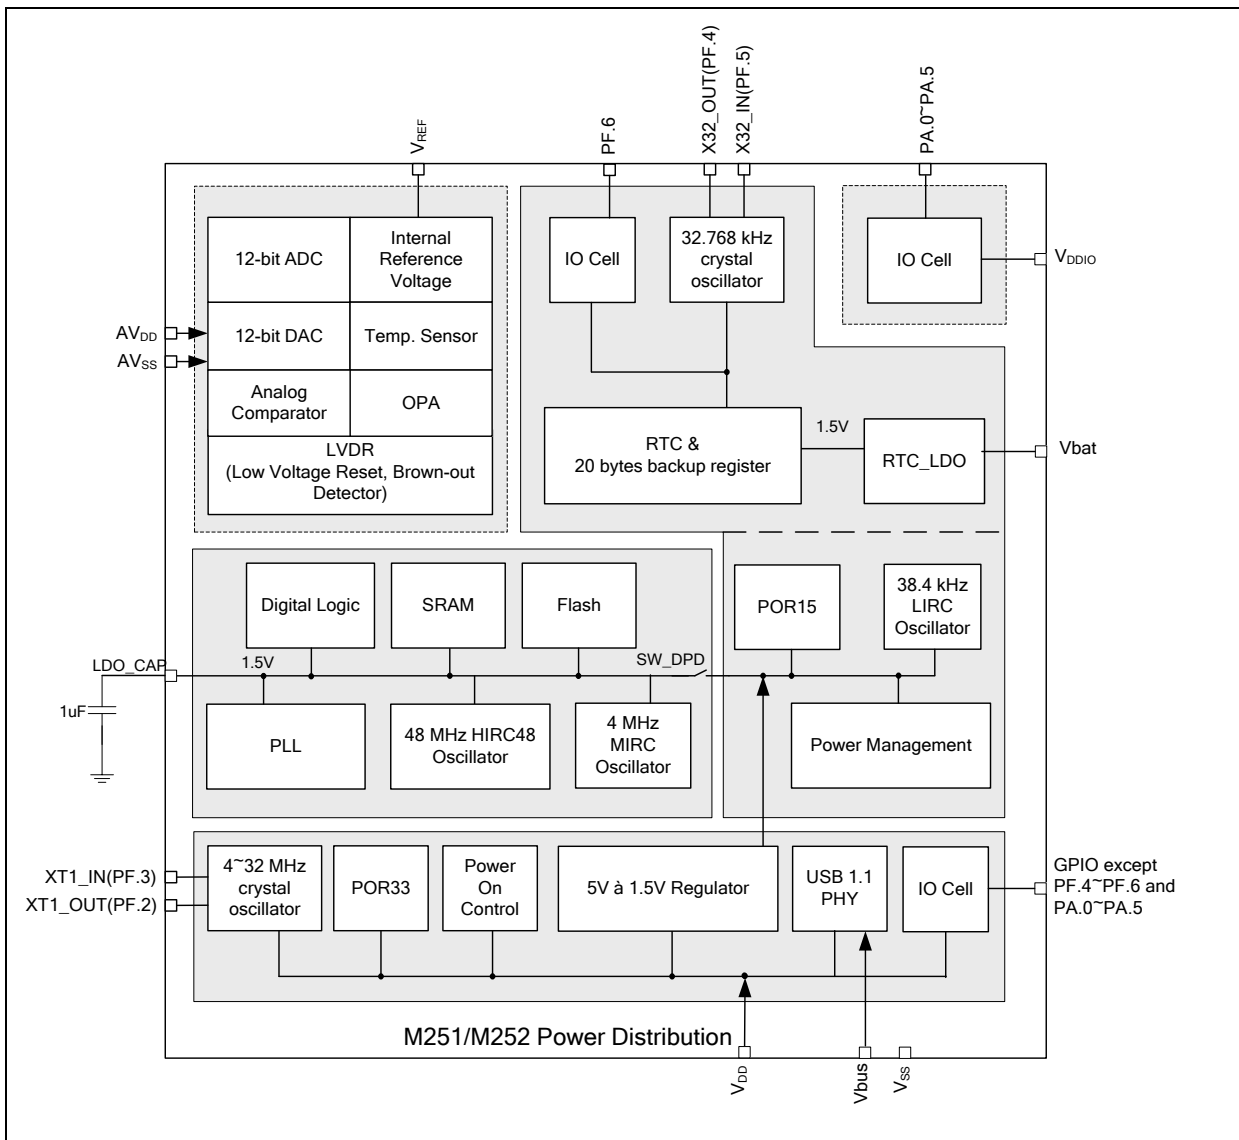

Figure 6.2-6 NuMicro® M251/M252 Power Distribution Diagram

6.2.4 Power Modes and Wake-up Sources

The M251/M252 series has a power manager unit to support several operating modes for saving power. Table 6.2-2 lists all power modes in the M251/M252 series.

Mode	CPU Operating Maximum Speed (MHz)	LDO_CAP(V)	Clock Disable
Normal mode	48	1.5	All clocks are disabled by control register.
Idle mode	CPU enters Sleep mode	1.5	Only CPU clock is disabled.
Power-down mode	CPU enters Deep Sleep mode	1.5	Most clocks are disabled except LIRC/LXT, and only RTC/WDT/Timer/UART peripheral clocks still enable if their clock sources are selected as LIRC/LXT.
Fast wake up Power-down mode (FWPD)	CPU enters Sleep mode	1.5	Most clocks are disabled except LIRC/LXT, and only RTC/WDT/Timer/UART peripheral clocks still enable if their clock sources are selected as LIRC/LXT.
Deep Power-down mode (DPD)	Power off	1.5	Only LIRC/LXT still enable for RTC function and wake-up timer usage

Table 6.2-2 Power Mode Table

There are different power mode entry settings. Each power mode has different entry setting and leaving condition. Table 6.2-3 shows the entry setting for each power mode. When chip power-on, chip is running ar normal mode. User can enter each mode by setting SLEEPDEEP (SCR[2]), PDEN (CLK_PWRCTL[7]) and PDMSEL (CLK_PMUCTL[2:0]) and execute WFI instruction.

Register/Instruction Mode	SLEEPDEEP (SCR[2])	PDEN (CLK_PWRCTL[7])	PDMSEL (CLK_PMUCTL[2:0])	CPU Run WFI Instruction
Normal mode	0	0	0	NO
Idle mode (CPU enters Sleep mode)	0	0	0	YES
Power-down mode (CPU enters Deep Sleep mode)	1	1	0	YES
Fast wake up Power-down mode (FWPD)	1	1	2	YES
Deep Power-down mode (CPU enters Sleep mode)	1	1	6	YES

Table 6.2-3 Power Mode Difference Table

There are several wake-up sources in Idle mode and Power-down mode. Table 6.2-4 lists the available clocks for each power mode.

Power Mode	Normal Mode	Idle Mode	Power-Down Mode
Definition	CPU is in active state	CPU is in sleep state	CPU is in sleep state and all clocks stop except LXT and LIRC. SRAM content retended.
Entry Condition	Chip is in normal mode after system reset released	CPU executes WFI instruction.	CPU sets sleep mode enable and power down enable and

			executes WFI instruction.
Wake-up Sources	N/A	All interrupts	RTC, WDT, I ² C, Timer, UART, BOD, GPIO, EINT, USCI, USB and ACMP
Available Clocks	All	All except CPU clock	LXT and LIRC
After Wake-up	N/A	CPU back to normal mode	CPU back to normal mode

Table 6.2-4 Power Mode Difference Table

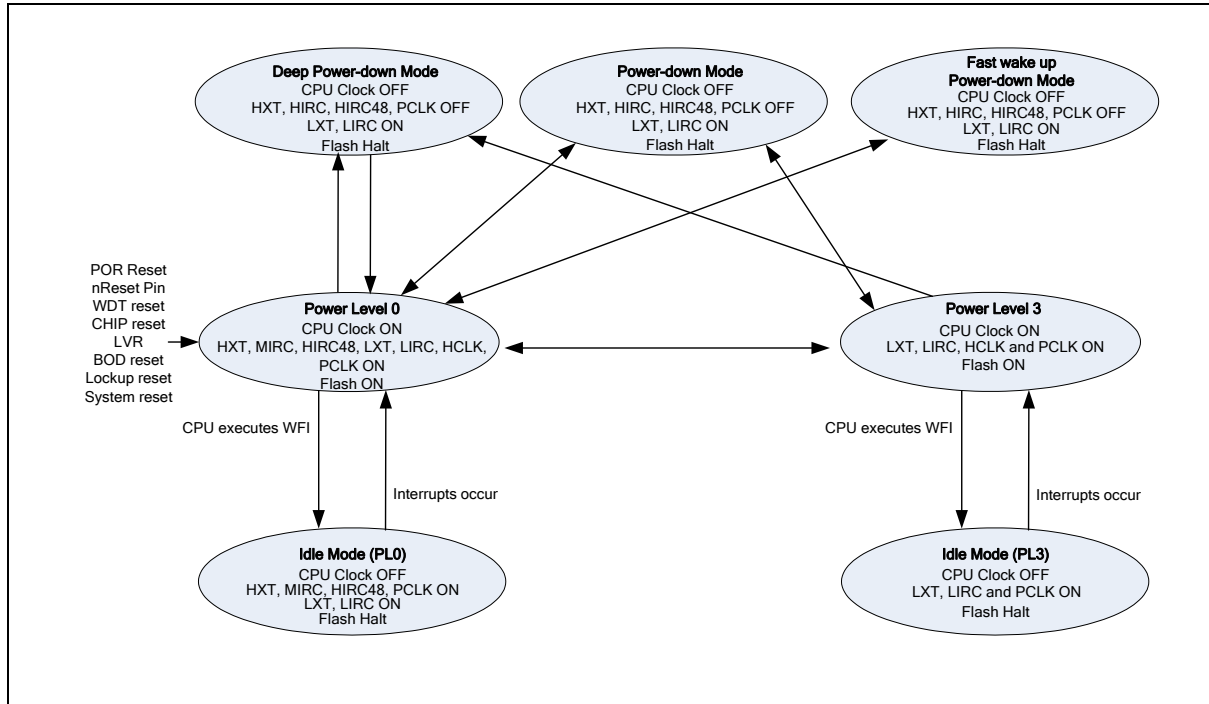

Figure 6.2-7 Power Mode State Machine

1. LXT (32768 Hz XTL) ON or OFF depends on SW setting in normal mode.
2. LIRC (38.4 kHz OSC) ON or OFF depends on S/W setting in normal mode.
3. If TIMER clock source is selected as LIRC/LXT and LIRC/LXT is on.
4. If WDT clock source is selected as LIRC and LIRC is on.
5. If RTC clock source is selected as LXT and LXT is on.
6. If UART clock source is selected as LXT and LXT is on.

	Normal Mode	Idle Mode	Power-Down Mode PD	DPD
HXT (4-32 MHz XTL)	ON	ON	Halt	Halt
MIRC (4 MHz OSC)	ON	ON	Halt	Halt
HIRC48 (48 MHz OSC)	ON	ON	Halt	Halt
LXT (32768 Hz XTL)	ON	ON	ON/OFF ¹	ON/OFF ¹
LIRC (38.4 kHz OSC)	ON	ON	ON/OFF ²	ON/OFF ²
PLL	ON/OFF	ON/OFF	Halt	Halt

LDO	ON	ON	ON	OFF
CPU	ON	Halt	Halt	Halt
HCLK/PCLK	ON	ON	Halt	Halt
SRAM retention	ON	ON	ON	OFF
FLASH	ON	ON	Halt	Halt
GPIO	ON	ON	Halt	Halt
PDMA	ON	ON	Halt	Halt
TIMER	ON	ON	ON/OFF ³	Halt
PWM	ON	ON	Halt	Halt
WDT	ON	ON	ON/OFF ⁴	Halt
WWDT	ON	ON	Halt	Halt
RTC	ON	ON	ON/OFF ⁵	ON/OFF ⁵
UART	ON	ON	ON/OFF ⁶	Halt
SC	ON	ON	Halt	Halt
USCI	ON	ON	Halt	Halt
I ² C	ON	ON	Halt	Halt

USBBD	ON	ON	Halt	Halt
ADC	ON	ON	Halt	Halt
ACMP	ON	ON	Halt	Halt

Table 6.2-5 Clocks in Power Modes

Wake-up sources in Power-down mode:

RTC, WDT, I²C, Timer, UART, USCI, BOD, GPIO, USBBD, and ACMP.

After chip enters power down, the following wake-up sources can wake chip up to normal mode. Table 6.2-5 lists the condition about how to enter Power-down mode again for each peripheral.

*User needs to wait this condition before setting PDEN(CLK_PWRCTL[7]) and execute WFI to enter Power-down mode.

Wake-Up Source	Wake-Up Condition	Power-Down Mode		System Can Enter Power-Down Mode Again Condition*
		PD FWKPD	DPD	
BOD	Brown-Out Detector Interrupt	Y	N	After software writes 1 to clear BODIF (SYS_BODCTL[4]).
LVR	LVR Reset	Y	N	After software writes 1 to clear LVRF (SYS_RSTSTS[3])
		N	Y	After software writes 1 to clear LVRWK (CLK_PMUSTS[12]) when DPD mode is entered.
INT	External Interrupt	Y	N	After software write 1 to clear the Px_INTSRC[n] bit.

GPIO	GPIO Interrupt	Y	N	After software write 1 to clear the Px_INTSRC[n] bit.
GPIO(PC.0) Wake-up pin	Rising or falling edge event, 1-pin	N	Y	PINWK(CLK_PMUSTS[0]) is cleared when DPD mode is entered.
GPIO(PB.0) Wake-up pin	Rising or falling edge event, 1-pin	N	Y	PINWK(CLK_PMUSTS[3]) is cleared when DPD mode is entered.
GPIO(PB.2) Wake-up pin	Rising or falling edge event, 1-pin	N	Y	PINWK(CLK_PMUSTS[4]) is cleared when DPD mode is entered.
GPIO(PB.12) Wake-up pin	Rising or falling edge event, 1-pin	N	Y	PINWK(CLK_PMUSTS[5]) is cleared when DPD mode is entered.
GPIO(PF.6) Wake-up pin	Rising or falling edge event, 1-pin	N	Y	PINWK(CLK_PMUSTS[6]) is cleared when DPD mode is entered.
TIMER	Timer Interrupt	Y	N	After software writes 1 to clear TWKF (TIMERx_INTSTS[1]) and TIF (TIMERx_INTSTS[0]).
Wakeup timer	Wakeup by wake-up timer time-out	N	Y	DPD_TMRWK (CLK_PMUSTS[2]) or DPD_TMRWK (CLK_PMUSTS[6]) is cleared when SPD or DPD mode is entered.
WDT	WDT Interrupt	Y	N	After software writes 1 to clear WKF (WDT_CTL[5]) (Write Protect).
RTC	Alarm Interrupt	Y	N	After software writes 1 to clear ALMIF (RTC_INTSTS[0]).
	Time Tick Interrupt	Y	N	After software writes 1 to clear TICKIF (RTC_INTSTS[1]).
RTC	Wakeup by RTC alarm	N	Y	RTCWK (CLK_PMUSTS[2]) is cleared when DPD mode is entered.
	Wakeup by RTC tick time	N	Y	RTCWK (CLK_PMUSTS[2]) is cleared when DPD mode is entered.
	Wakeup by tamper event	N	Y	RTCWK (CLK_PMUSTS[2]) is cleared when DPD mode is entered.
UART	nCTS wake-up	Y	N	After software writes 1 to clear CTSWK (UARTx_WKSTS[0]).
	Incoming Data wake-up	Y	N	After software writes 1 to clear DATWK (UARTx_WKSTS[1]).
	Received FIFO Threshold Wake-up	Y	N	After software writes 1 to clear RFRTWK (UARTx_WKSTS[2]).
	RS-485 AAD Mode Wake-up	Y	N	After software writes 1 to clear RS485WK (UARTx_WKSTS[3]).
	Received FIFO Threshold Time-out Wake-up	Y	N	After software writes 1 to clear TOUTWK (UARTx_WKSTS[4]).
USCI UART	CTS Toggle	Y	N	After software writes 1 to clear WKF (UUART_WKSTS[0]).
	Data Toggle	Y	N	After software writes 1 to clear WKF (UUART_WKSTS[0]).
USCI I ² C	Data toggle	Y	N	After software writes 1 to clear WKF (UI2C_WKSTS[0]).
	Address match	Y	N	After software writes 1 to clear WKAKDONE (UI2C_PROTSTS[16], and then writes 1 to clear WKF (UI2C_WKSTS[0]).
USCI SPI	SS Toggle	Y	N	After software writes 1 to clear WKF (USPI_WKSTS[0]).
I ² C	Address match wake-up	Y	N	After software writes 1 to clear WKAKDONE (I2C_WKSTS[1]). Then software writes 1 to clear WKIF (I2C_WKSTS[0]).
USB	Remote Wake-up	Y	N	After software writes 1 to clear BUSIF (USB_INTSTS[0]).

ACMP	Comparator Power-Down Wake-Up Interrupt	Y	N	After software writes 1 to clear WKIF0 (ACMP_STATUS[8]) and WKIF1 (ACMP_STATUS[9]).
------	---	---	---	---

Table 6.2-6 Condition of Entering Power-down Mode Again

6.2.5 Chip Bus Matrix

The M251/M252 series provides 4G-byte addressing space. The memory locations assigned to each on-chip controllers are shown in Table 6.2-7. The detailed register definition, memory space, and programming will be described in the following sections for each on-chip peripheral. The M251/M252 series only supports little-endian data format.

6.2.6 System Memory Map

The M251/M252 series provides 4G-byte addressing space. The memory locations assigned to each on-chip controllers are shown in Table 6.2-7. The detailed register definition, memory space, and programming will be described in the following sections for each on-chip peripheral. The M251/M252 series only supports little-endian data format.

Address Space	Token	Controllers
Flash and SRAM Memory Space		
0x0000_0000 – 0x0003_FFFF	FLASH_BA	FLASH Memory Space (256 Kbytes)
0x2000_0000 – 0x2000_7FFF	SRAM0_BA	SRAM Memory Space (32 Kbytes)
0x6000_0000 – 0x6FFF_FFFF	EXTMEM_BA	External Memory Space (256 Mbytes)
Peripheral Controllers Space (0x4000_0000 – 0x400F_FFFF)		
0x4000_0000 – 0x4000_01FF	SYS_BA	System Control Registers
0x4000_0200 – 0x4000_02FF	CLK_BA	Clock Control Registers
0x4000_0300 – 0x4000_03FF	NMI_BA	NMI Control Registers
0x4000_4000 – 0x4000_4FFF	GPIO_BA	GPIO Control Registers
0x4000_8000 – 0x4000_8FFF	PDMA_BA	Peripheral DMA Control Registers
0x4000_C000 – 0x4000_CFFF	FMC_BA	Flash Memory Control Registers
0x4001_0000 – 0x4001_0FFF	EBI_BA	External Bus Interface Control Registers
0x4003_1000 – 0x4003_1FFF	CRC_BA	CRC Generator Registers
APB Controllers Space (0x4000_0000 ~ 0x400F_FFFF)

Table 6.2-7 Address Space Assignments for On-Chip Controllers

6.2.7 SRAM Memory Organization

The M251/M252 series supports embedded SRAM with up to 32 Kbytes size.

- Supports up to 32 Kbytes SRAM
- Supports byte /half word /word write
- Supports oversize response error

Table 6.2-9 shows the M251/M252 series SRAM organization. The address between 0x2000_8000 to 0x3FFF_FFFF is illegal memory space and chip will enter hardfault if CPU accesses these illegal memory addresses.

Figure 6.2-8 SRAM Memory Organization

6.2.8 IRC Auto Trim

This chip supports auto-trim function: the HIRC trim (48 MHz RC oscillator) and MIRC trim (4.032 RC oscillator), according to the accurate LXT (32.768 kHz crystal oscillator) or internal USB synchronous mode, automatically gets accurate output frequency, 0.25 % deviation within all temperature ranges.

For instance, the system needs an accurate 4.032 MHz clock. In such case, if neither using use PLL as the system clock source nor soldering 32.768 kHz crystal in system, user has to set REFCKSEL (SYS_MIRCTRIMCTL[10] reference clock selection) to “1”, set FREQSEL (SYS_MIRCTRIMCTL[1:0] trim frequency selection) to “10”, and the auto-trim function will be enabled. Interrupt status bit FREQLOCK (SYS_MIRCTRIMSTS[0] MIRC frequency lock status) “1” indicates the MIRC output frequency is accurate within 0.25% deviation.

In HIRC case, the system needs an accurate 48 MHz clock. In such case, if neither using use PLL as the system clock source nor soldering 32.768 kHz crystal in system, user has to set REFCKSEL (SYS_HIRCTRIMCTL[10] reference clock selection) to “1”, set FREQSEL (SYS_HIRCTRIMCTL[1:0] trim frequency selection) to “10”, and the auto-trim function will be enabled. Interrupt status bit FREQLOCK (SYS_HIRCTRIMSTS[8] HIRC frequency lock status) “1” indicates the HIRC output frequency is accurate within 0.25% deviation.

HIRC trim and MIRC trim only can work properly when the clock sources are stable. When the RC clock or the reference clock are not stable or the system go into power down, HIRC trim and MIRC trim need to wait until the clock are stable or system wake up, then it can be enable or it will get a clock error flag.

6.2.9 UART0_TXD/USC10_DAT0 Modulation with PWM

This chip supports UART0_TXD/USC10_DAT0 to modulate with PWM channel. User can set MODPWMSEL(SYS_MODCTL[7:4]) to select which PWM0 channel to modulate with UART0_TXD/USC10_DAT0 and set MODEN(SYS_MODCTL[0]) to enable modulation function.

Figure 6.2-11 UART0_TXD/USC10_DAT0 Modulated with PWM Channel

[15]	Reserved	Reserved.

Bits	Description	
[14:12]	LVRDGSEL	<p>LVR Output De-glitch Time Select (Write Protect)</p> <p>000 = Without de-glitch function. 001 = 4 MIRC clock (4 MHz), 1 us. 010 = 8 MIRC clock (4 MHz), 2 us. 011 = 16 MIRC clock (4 MHz), 4 us. 100 = 32 MIRC clock (4 MHz), 8 us. 101 = 64 MIRC clock (4 MHz), 16 us. 110 = 128 MIRC clock (4 MHz), 32 us. 111 = 256 MIRC clock (4 MHz), 64 us.</p> <p>Note: These bits are write protected. Refer to the SYS_REGLCTL register. Note: The MIRC enabled automatically when LVRDGSEL is not 000 and LVREN is 1.</p>
[11]	Reserved	Reserved.
[10:8]	BODDGSEL	<p>Brown-out Detector Output De-glitch Time Select (Write Protect)</p> <p>000 = BOD output is sampled by LIRC. 001 = 4 system clock (HCLK). 010 = 8 system clock (HCLK). 011 = 16 system clock (HCLK). 100 = 32 system clock (HCLK). 101 = 64 system clock (HCLK). 110 = 128 system clock (HCLK). 111 = 256 system clock (HCLK).</p> <p>Note: These bits are write protected. Refer to the SYS_REGLCTL register.</p>
[7]	LVREN	<p>Low Voltage Reset Enable Bit (Write Protect)</p> <p>The LVR function resets the chip when the input power voltage is lower than LVR circuit setting. LVR function is enabled by default.</p> <p>0 = Low Voltage Reset function Disabled. 1 = Low Voltage Reset function Enabled.</p> <p>Note 1: After enabling the bit, the LVR function will be active with 3ms delay for LVR output stable (default). Note 2: For BOD low power mode to be active, this bit must be set 1 Note 3: This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[6]	BODOUT	<p>Brown-out Detector Output Status</p> <p>0 = Brown-out Detector output status is 0. It means the detected voltage is higher than BODVL setting or BODEN is 0. 1 = Brown-out Detector output status is 1. It means the detected voltage is lower than BODVL setting. If the BODEN is 0, BOD function disabled, this bit always responds 0000.</p>
[5]	BODLPM	<p>Brown-out Detector Low Power Mode (Write Protect)</p> <p>0 = BOD operate in normal mode (default). 1 = BOD Low Power mode Enabled.</p> <p>Note 1: The BOD consumes about 100uA in normal mode, the low power mode can reduce the current to about 1/10 but slow the BOD response. Note 2: For BOD low power mode to be active, LVREN must be set to 1 Note 3: This bit is write protected. Refer to the SYS_REGLCTL register.</p>

Bits	Description	
[4]	BODIF	<p>Brown-out Detector Interrupt Flag</p> <p>0 = Brown-out Detector does not detect any voltage draft at V_{DD} down through or up through the voltage of BODVL setting.</p> <p>1 = When Brown-out Detector detects the V_{DD} is dropped down through the voltage of BODVL setting or the V_{DD} is raised up through the voltage of BODVL setting, this bit is set to 1 and the brown-out interrupt is requested if brown-out interrupt is enabled.</p> <p>Note: Write 1 to clear this bit to 0.</p>
[3]	BODRSTEN	<p>Brown-out Reset Enable Bit (Write Protect)</p> <p>The default value is set by Flash controller user configuration register CBORST(CONFIG0[20]) bit.</p> <p>0 = Brown-out "INTERRUPT" function Enabled.</p> <p>1 = Brown-out "RESET" function Enabled.</p> <p>Note 1: While the Brown-out Detector function is enabled (BODEN high) and BOD reset function is enabled (BODRSTEN high), BOD will assert a signal to reset chip when the detected voltage is lower than the threshold (BODOUT high).</p> <p>While the BOD function is enabled (BODEN high) and BOD interrupt function is enabled (BODRSTEN low), BOD will assert an interrupt if BODOUT is high. BOD interrupt will keep till to the BODEN set to 0. BOD interrupt can be blocked by disabling the NVIC BOD interrupt or disabling BOD function (set BODEN low).</p> <p>Note 2: This bit is write protected. Refer to the SYS_REGLCTL register.</p> <p>Note 3: Reset by power on reset.</p>
[2:1]	Reserved	Reserved.
[0]	BODEN	<p>Brown-out Detector Enable Bit (Write Protect)</p> <p>The default value is set by Flash controller user configuration register CBODEN (CONFIG0 [19]).</p> <p>0 = Brown-out Detector function Disabled.</p> <p>1 = Brown-out Detector function Enabled.</p> <p>Note 1: This bit is write protected. Refer to the SYS_REGLCTL register.</p> <p>Note 2: Reset by power on reset.</p>

Register Lock Control Register (SYS_REGLCTL)

Some of the system control registers need to be protected to avoid inadvertent write and disturb the chip operation. These system control registers are protected after the power-on reset till user to disable register protection. For user to program these protected registers, a register protection disable sequence needs to be followed by a special programming. The register protection disable sequence is writing the data “59h”, “16h” “88h” to the register SYS_REGLCTL address at 0x4000_0100 continuously. Any different data value, different sequence or any other write to other address during these three data writing will abort the whole sequence.

After the protection is disabled, user can check the protection disable bit at address 0x4000_0100 bit0, 1 is protection disable, and 0 is protection enable. Then user can update the target protected register value and then write any data to the address “0x4000_0100” to enable register protection.

This register is written to disable/enable register protection and read for the REGLCTL status.

Reserved							PLCBUSY

Bits	Description
[31:10]	Reserved Reserved.
[9:8]	CURPL Current Power Level (Read Only) This bit field reflect the current power level. 00 = Current power level is PL0. 11 = Current power level is PL3. Others = Reserved. Note : When system is at PL3, HCLK clock has to come from LXT or LIRC.
[7:1]	Reserved Reserved.
[0]	PLCBUSY Power Level Change Busy Bit (Read Only) This bit is set by hardware when power level is changing. After power level change is completed, this bit will be cleared automatically by hardware. 0 = Power level change is completed. 1 = Power level change is ongoing.

6.2.12 System Timer (SysTick)

The Cortex[®]-M23 includes an integrated system timer, SysTick, which provides a simple, 24-bit clear-on-write, decrementing, wrap-on-zero counter with a flexible control mechanism. The counter can be used as a Real Time Operating System (RTOS) tick timer or as a simple counter.

When system timer is enabled, it will count down from the value in the SysTick Current Value Register (SYST_VAL) to zero, and reload (wrap) to the value in the SysTick Reload Value Register (SYST_LOAD) on the next clock cycle, and then decrement on subsequent clocks. When the counter transitions to zero, the COUNTFLAG status bit is set. The COUNTFLAG bit clears on reads.

The SYST_VAL value is UNKNOWN on reset. Software should write to the register to clear it to zero before enabling the feature. This ensures the timer will count from the SYST_LOAD value rather than an arbitrary value when it is enabled.

If the SYST_LOAD is zero, the timer will be maintained with a current value of zero after it is reloaded with this value. This mechanism can be used to disable the feature independently from the timer enable bit.

For more detailed information, please refer to the “Arm[®] Cortex[®]-M23 Technical Reference Manual” and “Arm v8-M Architecture Reference Manual”.

6.2.12.1 System Timer Control Register Map

R: read only, W: write only, R/W: both read and write

CURRENT							

Bits	Description	
[31:24]	Reserved	Reserved.
[23:0]	CURRENT	System Tick Current Value Current counter value. This is the value of the counter at the time it is sampled. The counter does not provide read-modify-write protection. The register is write-clear. A software write of any value will clear the register to 0.

6.2.13 Nested Vectored Interrupt Controller (NVIC)

The NVIC and the processor core interface are closely coupled to enable low latency interrupt processing and efficient processing of late arriving interrupts. The NVIC maintains knowledge of the stacked, or nested, interrupts to enable tail-chaining of interrupts. You can only fully access the NVIC from privileged mode, but you can cause interrupts to enter a pending state in user mode if you enable the Configuration and Control Register. Any other user mode access causes a bus fault. You can access all NVIC registers using byte, halfword, and word accesses unless otherwise stated. NVIC registers are located within the SCS (System Control Space). All NVIC registers and system debug registers are little-endian regardless of the endianness state of the processor.

The NVIC supports:

- An implementation-defined number of interrupts, in the range 1-64 interrupts.
- A programmable priority level of 0-3 for each interrupt; a higher level corresponds to a lower priority, so level 0 is the highest interrupt priority.
- Level and pulse detection of interrupt signals.
- Dynamic reprioritization of interrupts.
- Grouping of priority values into group priority and subpriority fields.
- Interrupt tail-chaining.
- An external Non Maskable Interrupt (NMI)
- WIC with Ultra-low Power Sleep mode support

The processor automatically stacks its state on exception entry and unstacks this state on exception exit, with no instruction overhead. This provides low latency exception handling.

6.2.13.1 Exception Model and System Interrupt Map

Table 6.2-8 lists the exception model supported by the M251/M252 series. Software can set 4 levels of priority on some of these exceptions as well as on all interrupts. The highest user-configurable priority is denoted as “0x00” and the lowest priority is denoted as “0xC0” (The 6-LSB always 0). The default priority of all the user-configurable interrupts is “0x00”. Note that priority “0” is treated as the fourth priority on the system, after three system exceptions “Reset”, “NMI” and “Hard Fault”.

When any interrupts is accepted, the processor will automatically fetch the starting address of the interrupt service routine (ISR) from a vector table in memory. On system reset, the vector table is fixed at address 0x00000000. Privileged software can write to the VTOR to relocate the vector table start address to a different memory location, in the range 0x00000080 to 0x3FFFFFF80,

The vector table contains the initialization value for the stack pointer on reset, and the entry point addresses for all exception handlers. The vector number on previous page defines the order of entries in the vector table associated with exception handler entry as illustrated in previous section.

Exception Type	Vector Number	Vector Address	Priority
Reset	1	0x00000004	-3
NMI	2	0x00000008	-2
Hard Fault	3	0x0000000C	-1
Reserved	4~ 10		Reserved
SVCall	11	0x0000002C	Configurable
Reserved	12~13		Reserved
PendSV	14	0x00000038	Configurable

SysTick	15	0x0000003C	Configurable
Interrupt (IRQ0 ~ IRQ63)	16 ~ 63	0x00000000 + (Vector Number)*4	Configurable

Table 6.2-8 Exception Model

Vector Number	Interrupt Number (Bit In Interrupt Registers)	Interrupt Name	Interrupt Description
0 ~ 15	-	-	System exceptions

77	61	Reserved	Reserved

78	62	OPA0	OPA0 interrupt
79	63	Reserved	Reserved

Table 6.2-9 Interrupt Number Table

6.2.13.2 Operation Description

NVIC interrupts can be enabled and disabled by writing to their corresponding Interrupt Set-Enable or Interrupt Clear-Enable register bit-field. The registers use a write-1-to-enable and write-1-to-clear policy, both registers reading back the current enabled state of the corresponding interrupts. When an interrupt is disabled, interrupt assertion will cause the interrupt to become Pending, however, the interrupt will not activate. If an interrupt is Active when it is disabled, it remains in its Active state until cleared by reset or an exception return. Clearing the enable bit prevents new activations of the associated interrupt.

NVIC interrupts can be pended/un-pended using a complementary pair of registers to those used to enable/disable the interrupts, named the Set-Pending Register and Clear-Pending Register respectively. The registers use a write-1-to-enable and write-1-to-clear policy, both registers reading back the current pended state of the corresponding interrupts. The Clear-Pending Register has no effect on the execution status of an Active interrupt.

NVIC interrupts are prioritized by updating an 8-bit field within a 32-bit register (each register supporting four interrupts).

The general registers associated with the NVIC are all accessible from a block of memory in the System Control Space and will be described in next section.

6.2.13.3 NVIC Control Registers

6.2.14 System Control Register

The Cortex[®]-M23 status and operation mode control are managed by System Control Registers. Including CPUID, Cortex[®]-M23 interrupt priority and Cortex[®]-M23 power management can be controlled through these system control registers.

For more detailed information, please refer to the “Arm[®] Cortex[®]-M23 Technical Reference Manual” and “Arm v6-M Architecture Reference Manual”.

6.3 Clock Controller

6.3.1 Overview

The clock controller generates clocks for the whole chip, including system clocks and all peripheral clocks. The clock controller also implements the power control function with the individually clock ON/OFF control, clock source selection and a clock divider. The chip will not enter Power-down mode until CPU sets the Power-down enable bit PDEN(CLK_PWRCTL[7]) and Cortex[®]-M23 core executes the WFI instruction. After that, chip enters Power-down mode and wait for wake-up interrupt source triggered to leave Power-down mode. In Power-down mode, the clock controller turns off the 4~32 MHz external high speed crystal (HXT) , 48 MHz internal high speed RC oscillator (HIRC) and 4 MHz internal median speed RC oscillator (MIRC) to reduce the overall system power consumption Figure 6.3-1 shows the clock generator and the overview of the clock source control.

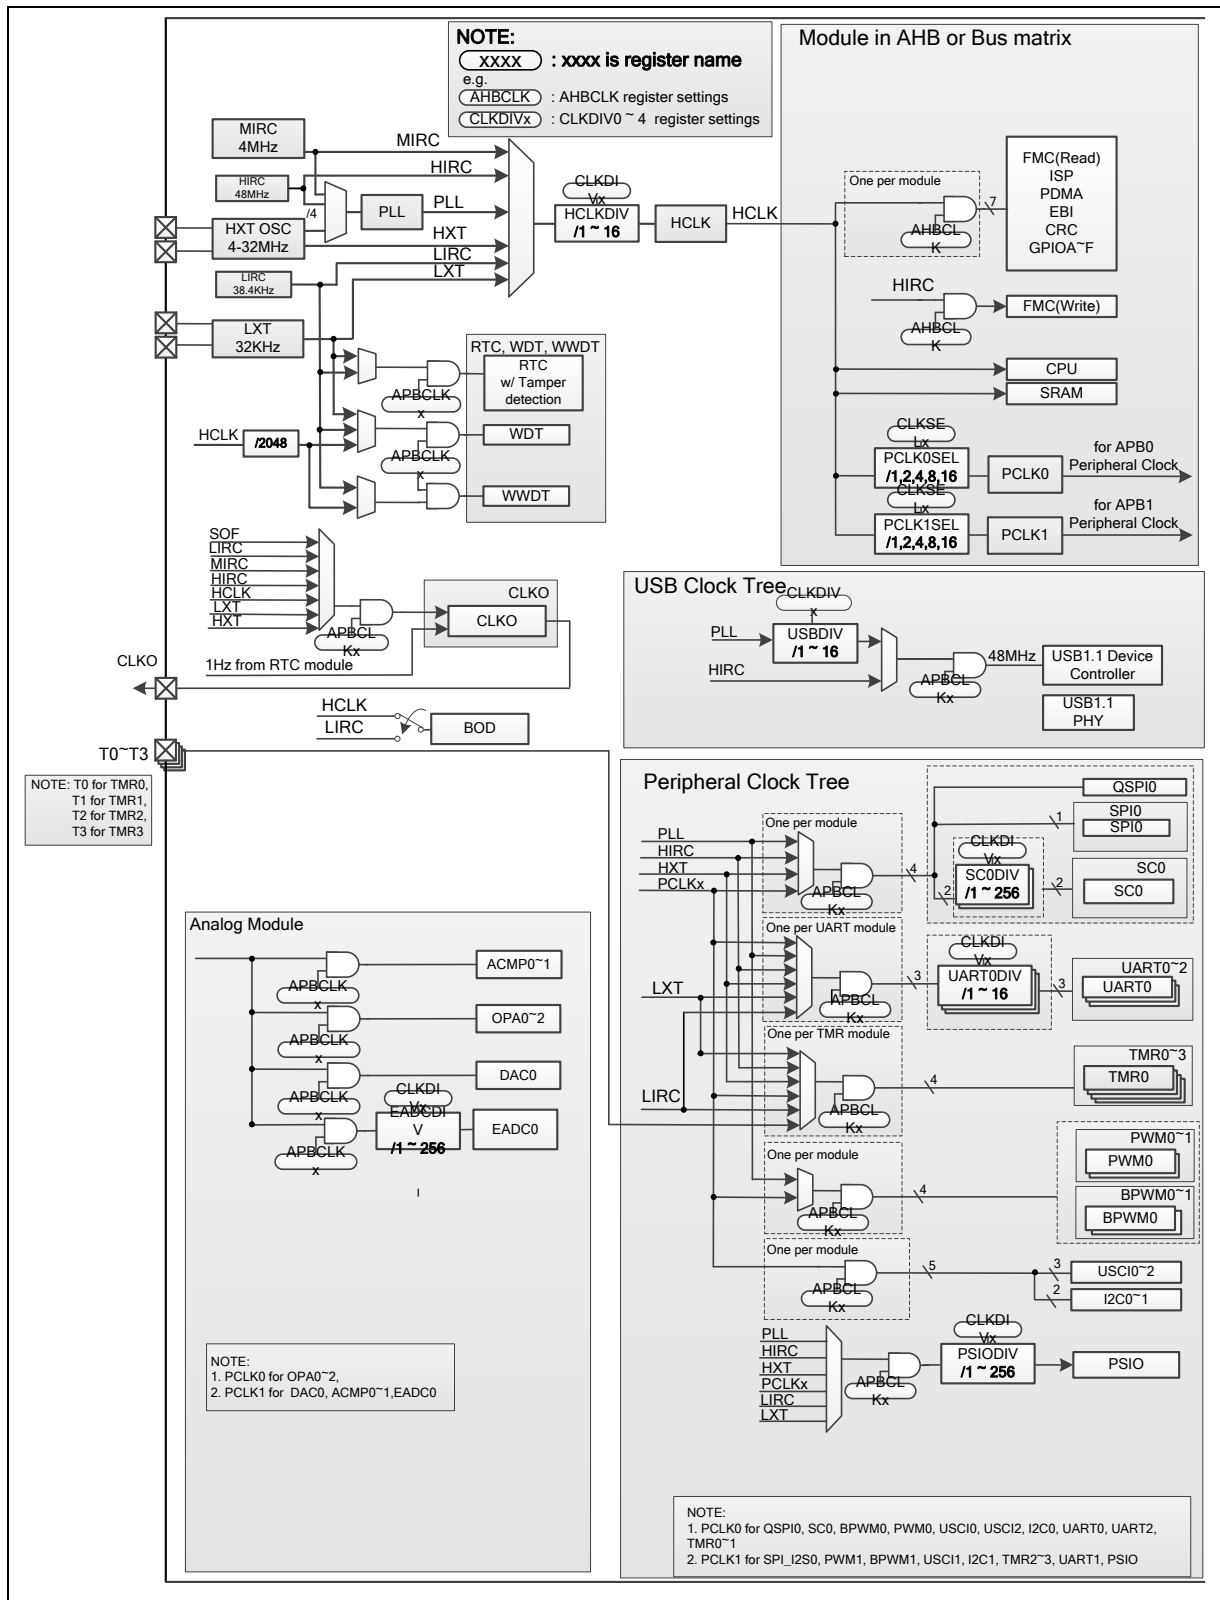

Figure 6.3-1 Clock Generator Global View Diagram

6.3.2 Clock Generator

The clock generator consists of 6 clock sources, which are listed below:

- 32.768 kHz external low speed crystal oscillator (LXT)
- 4~32 MHz external high speed crystal oscillator (HXT)
- Programmable PLL output clock frequency (PLLFOUT) - PLL source can be selected from external 4~32 MHz external high speed crystal (HXT), 48 MHz internal high speed oscillator (HIRC/4) or 4 MHz internal medium speed oscillator (MIRC)
- 48 MHz internal high speed RC oscillator (HIRC)
- 38.4 kHz internal low speed RC oscillator (LIRC)
- 4 MHz internal medium speed oscillator (MIRC)

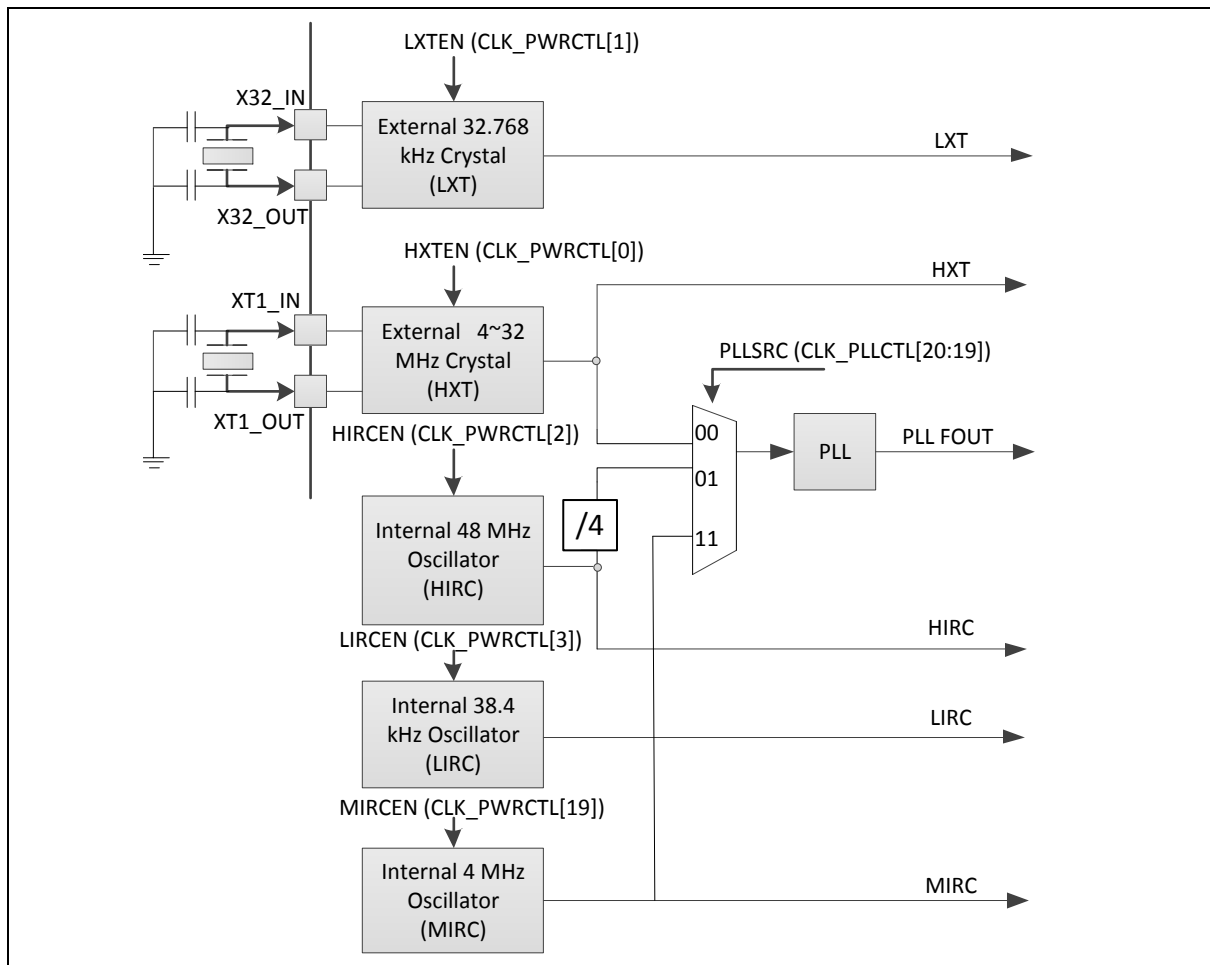

Figure 6.3-2 Clock Generator Block Diagram

6.3.3 System Clock and SysTick Clock

The system clock has 6 clock sources, which are generated from clock generator block. The clock source switch depends on the register HCLKSEL (CLK_CLKSEL0[2:0]). The block diagram is shown in Figure 6.3-3

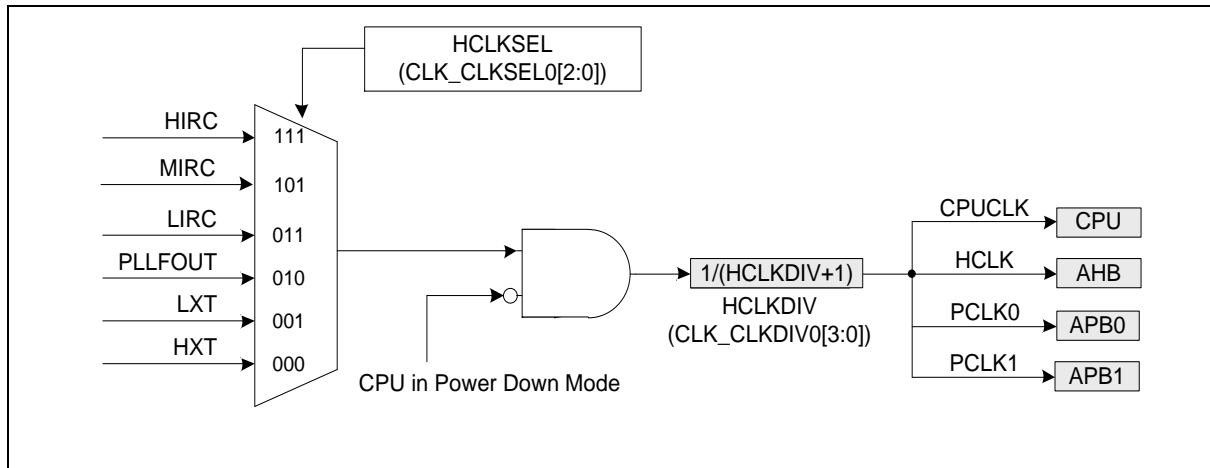

Figure 6.3-3 System Clock Block Diagram

There are two clock fail detectors to observe HXT and LXT clock source and they have individual enable and interrupt control. When HXT detector is enabled, the MIRC clock is enabled automatically. When LXT detector is enabled, the LIRC clock is enabled automatically.

When HXT clock detector is enabled, the system clock will auto switch to MIRC if HXT clock stop being detected on the following condition: system clock source comes from HXT or system clock source comes from PLL with HXT as the input of PLL. If HXT clock stop condition is detected, the HXTFIF (CLK_CLKDSTS[0]) is set to 1 and chip will enter interrupt if HXTFIE (CLK_CLKDCTL[5]) is set to 1. User can try to recover HXT by disable HXT and enable HXT again to check if the clock stable bit is set to 1 or not. If HXT clock stable bit is set to 1, it means HXT is recover to oscillate after re-enable action and user can switch system clock to HXT again.

The HXT clock stop detect and system clock switch to MIRC procedure is shown in Figure 6.3-4.

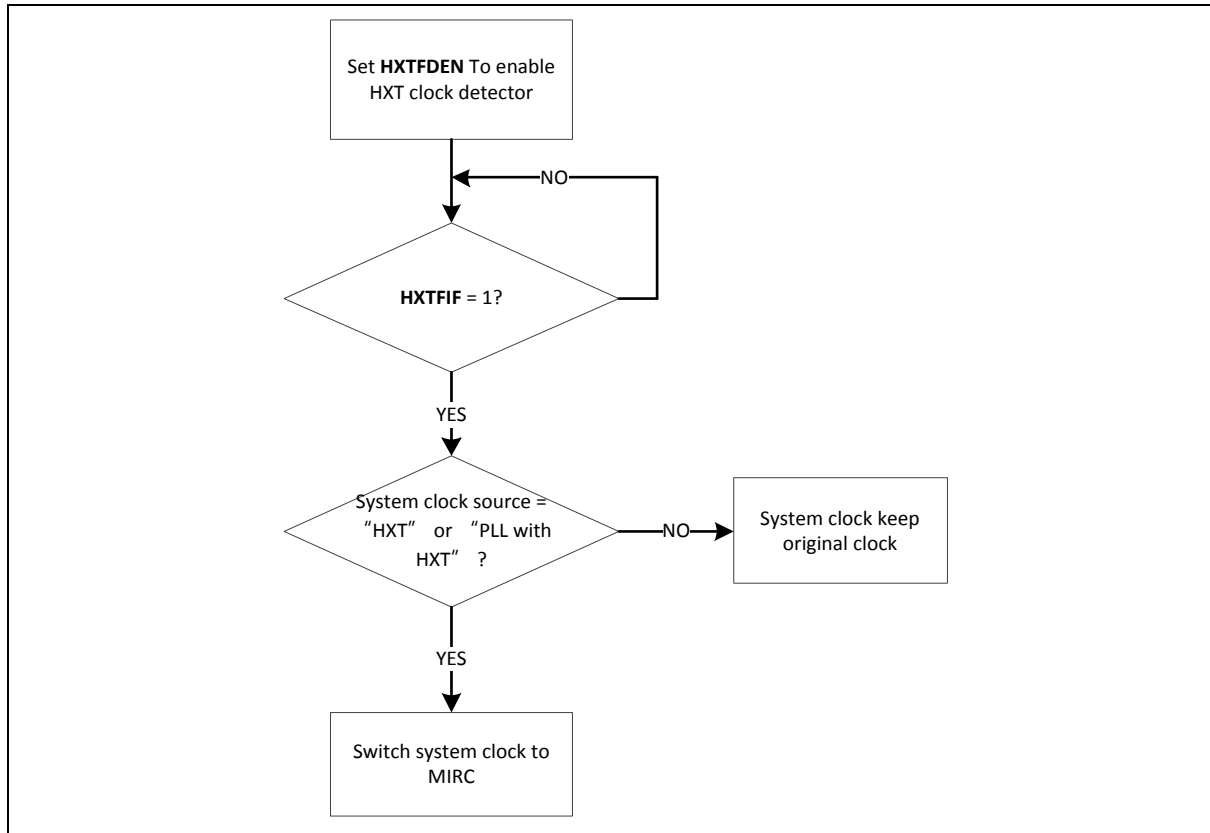

Figure 6.3-4 HXT Stop Protect Procedure

The clock source of SysTick in Cortex®-M23 core can use CPU clock or external clock (SYST_CTRL[2]). If using external clock, the SysTick clock (STCLK) has 5 clock sources. The clock source switch depends on the setting of the register STCLKSEL (CLK_CLKSEL0[5:3]). The block diagram is shown in Figure 6.3-5.

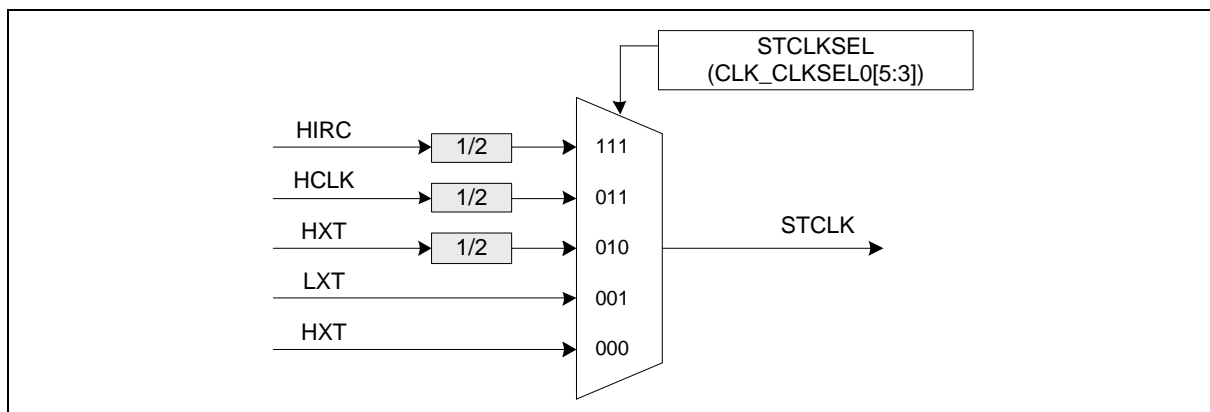

Figure 6.3-5 SysTick Clock Control Block Diagram

6.3.4 Peripherals Clock

The peripherals clock has different clock source switch setting, which depends on the different peripheral. Please refer to the CLK_CLKSEL1 and CLK_CLKSEL2 register description in 5.3.8.

6.3.5 Power-down Mode Clock

When entering Power-down mode, system clocks, some clock sources and some peripheral clocks are disabled. Some clock sources and peripherals clock are still active in Power-down mode.

For these clocks, which still keep active, are listed below:

- Clock Generator
 - 38.4 kHz internal low speed RC oscillator (LIRC) clock
 - 32.768 kHz external low speed crystal oscillator (LXT) clock
- Peripherals Clock, except for HCLK, PCLK0 and PCLK1(When the modules adopt LXT or LIRC as clock source)

6.3.6 Clock Output

This device is equipped with a power-of-2 frequency divider which is composed by 16 chained divide-by-2 shift registers. One of the 16 shift register outputs selected by a sixteen to one multiplexer is reflected to CLKO function pin. Therefore there are 16 options of power-of-2 divided clocks with the frequency from $F_{in}/2^1$ to $F_{in}/2^{16}$ where F_{in} is input clock frequency to the clock divider.

The output formula is $F_{out} = F_{in}/2^{(N+1)}$, where F_{in} is the input clock frequency, F_{out} is the clock divider output frequency and N is the 4-bit value in **FREQSEL** (CLK_CLKOCTL[3:0]).

When writing 1 to **CLKOEN** (CLK_CLKOCTL[4]), the chained counter starts to count. When writing 0 to **CLKOEN** (CLK_CLKOCTL[4]), the chained counter continuously runs till divided clock reaches low state and stays in low state.

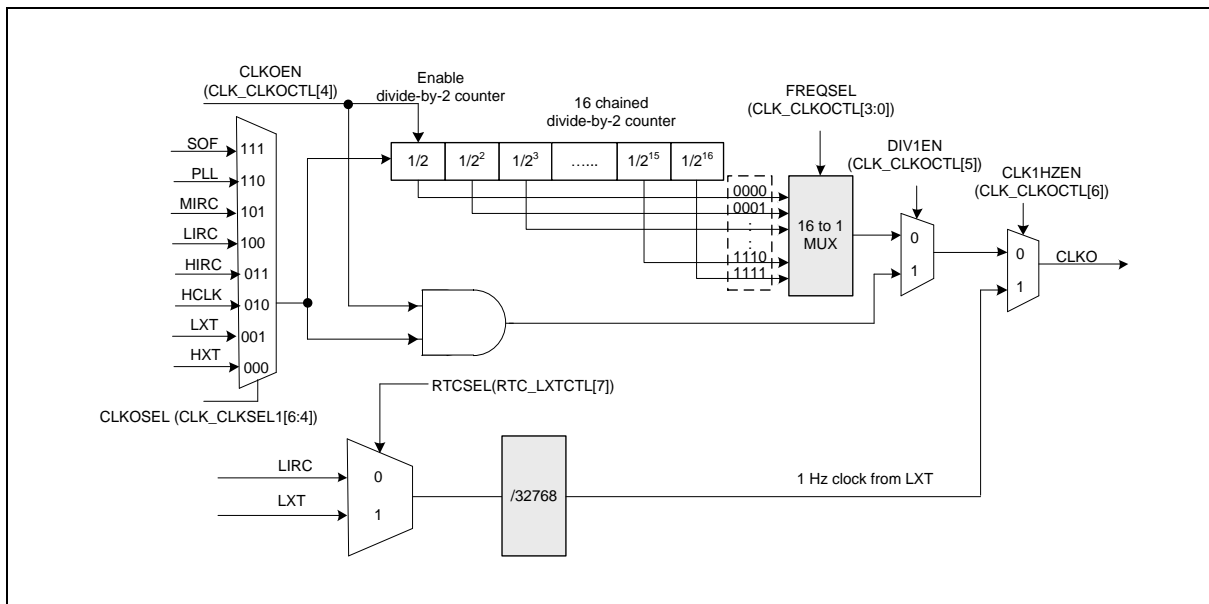

Figure 6.3-6 Clock Output Block Diagram

6.3.7 USB Clock Source

The clock source of USB 1.0 is generated from 48Mhz HIRC or programmable PLL output. The generated clocks are shown in Figure 6.3-7.

USBPLLDIV is the clock divider output frequency, the output formula is

$(\text{PLLFOUT frequency}) / (\text{USBDIV} + 1)$.

PLL Control Register (CLK_PLLCTL)

The PLL reference clock input is from the 4~32 MHz external high speed crystal oscillator (HXT) clock input or from the 12 MHz internal high speed RC oscillator (HIRC). This register is used to control the PLL output frequency and PLL operation mode.

Programming these bits needs to write “59h”, “16h”, “88h” to address 0x4000_0100 to disable register protection. Refer to the register SYS_REGLCTL at address SYS_BA+0x100.

CLK_PLLCTL only can be modified while PD(CLK_PLLCTL[16]) is set.

Register	Offset	R/W	Description	Reset Value
CLK_PLLCTL	CLK_BA+0x40	R/W	PLL Control Register	0x0005_4618

Bits	Description	
[31:25]	Reserved	Reserved.
[24]	PLL_CLF_EN	1: PLL Clock Filter On 0 : OFF
[23]	STBSEL	PLL Stable Counter Selection (Write Protect) 0 = PLL stable time is 1200 PLL source clock (suitable for source clock is equal to or less than 12 MHz). 1 = PLL stable time is 3200 PLL source clock (suitable for source clock is larger than 12 MHz). Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[22:21]	Reserved	Reserved.
[20:19]	PLLSRC	PLL Source Clock Selection (Write Protect) 00 = PLL source clock from 4~32 MHz external high-speed crystal oscillator (HXT). 01 = PLL source clock from 12 MHz internal high-speed oscillator (HIRC/4). 10 = PLL source clock from 4~32 MHz external high-speed crystal oscillator (HXT). 11 = PLL source clock from 4 MHz internal high-speed oscillator (MIRC). Note: This bit is write protected. Refer to the SYS_REGLCTL register. Note: MIRC and HIRC have to be both on when source switch between them
[18]	OE	PLL OE (FOUT Enable) Pin Control (Write Protect) 0 = PLL FOUT Enabled. 1 = PLL FOUT is fixed low.

		Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[17]	BP	PLL Bypass Control (Write Protect) 0 = PLL is in normal mode (default). 1 = PLL clock output is same as PLL input clock FIN. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[16]	PD	Power-down Mode (Write Protect) If set the PDEN bit to 1 in CLK_PWRCTL register, the PLL will enter Power-down mode, too. 0 = PLL is in normal mode. 1 = PLL is in Power-down mode (default). Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[15:14]	OUTDIV	PLL Output Divider Control (Write Protect) Refer to the formulas below the table. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[13]	Reserved	Reserved.
[12:9]	INDIV	PLL Input Divider Control (Write Protect) Refer to the formulas below the table. Note: This bit is write protected. Refer to the SYS_REGLCTL register.
[8:6]	Reserved	Reserved.
[5:0]	FBDIV	PLL Feedback Divider Control (Write Protect) Refer to the formulas below the table. Note: This bit is write protected. Refer to the SYS_REGLCTL register.

By default, when FIN is 12Mhz, PLL output is 48Mhz, Output Clock Frequency formula:

$$F_{OUT} = F_{IN} \times \frac{NF}{NR} \times \frac{1}{NO}$$

$F_{REF} = F_{IN} / NR$, where F_{REF} is the comparison frequency for the PFD (phase frequency detector).

$$F_{VCO} = F_{OUT} * NO$$

For proper operation in normal mode, the following constraints must be satisfied:

$$4 \text{ MHz} \leq F_{REF} \leq 8 \text{ MHz}$$

$$64 \text{ MHz} \leq F_{VCO} \leq 100 \text{ MHz}$$

$$16 \text{ MHz} \leq F_{OUT} \leq 100 \text{ MHz}$$

Symbol	Description
F_{OUT}	Output Clock Frequency
F_{IN}	Input (Reference) Clock Frequency
NR	Input Divider (INDIV), when INDIV =0, NR = 16
NF	Feedback Divider (FBDIV), when FBDIV=0, NF = 64
NO	OUTDIV = "00" : NO = 1 OUTDIV = "01" : NO = 2 OUTDIV = "10" or "11" : NO = 4

Table 6.3-1 The symbol definition of PLL Output Frequency formula

Clock Status Monitor Register (CLK_STATUS)

The bits in this register are used to monitor if the chip clock source is stable or not, and whether the clock switch is failed.

6.4 Flash Memory Controller (FMC)

6.4.1 Overview

The FMC is equipped with 32/64/128/256 Kbytes on-chip embedded Flash for application. A User Configuration block provides for system initiation. A 4 Kbytes loader ROM (LDROM) is used for In-System-Programming (ISP) function. XOM (Execution Only Memory) setting block to conceal user program in XOM region. A 512 bytes cache with zero wait cycle is used to improve Flash access performance. This chip also supports In-Application-Programming (IAP) function. User switches the code executing without chip reset after the embedded Flash is updated.

6.4.2 Features

- Supports 32/64/128/256 Kbytes application ROM (APROM)
- Supports 4 Kbytes loader ROM (LDROM)
- Supports 1 XOM (Execution Only Memory) region to conceal user program in APROM
- Supports 12 bytes User Configuration block to control system initiation.
- Supports 512 bytes page erase for all embedded Flash
- Supports 32-bit and multi-word Flash programming function
- Supports CRC32 checksum calculation function
- Supports Flash all one verification function
- Supports embedded SRAM remap to system vector memory
- Supports In-System-Programming (ISP) / In-Application-Programming (IAP) to update embedded Flash memory
- Supports cache memory to improve Flash access performance and reduce power consumption

6.4.3 Block Diagram

The Flash memory controller (FMC) consists of AHB slave interface, cache memory controller, Flash control registers, Flash initialization controller, Flash operation control and embedded Flash memory. The block diagram of Flash memory controller is shown in Figure 6.4-1.

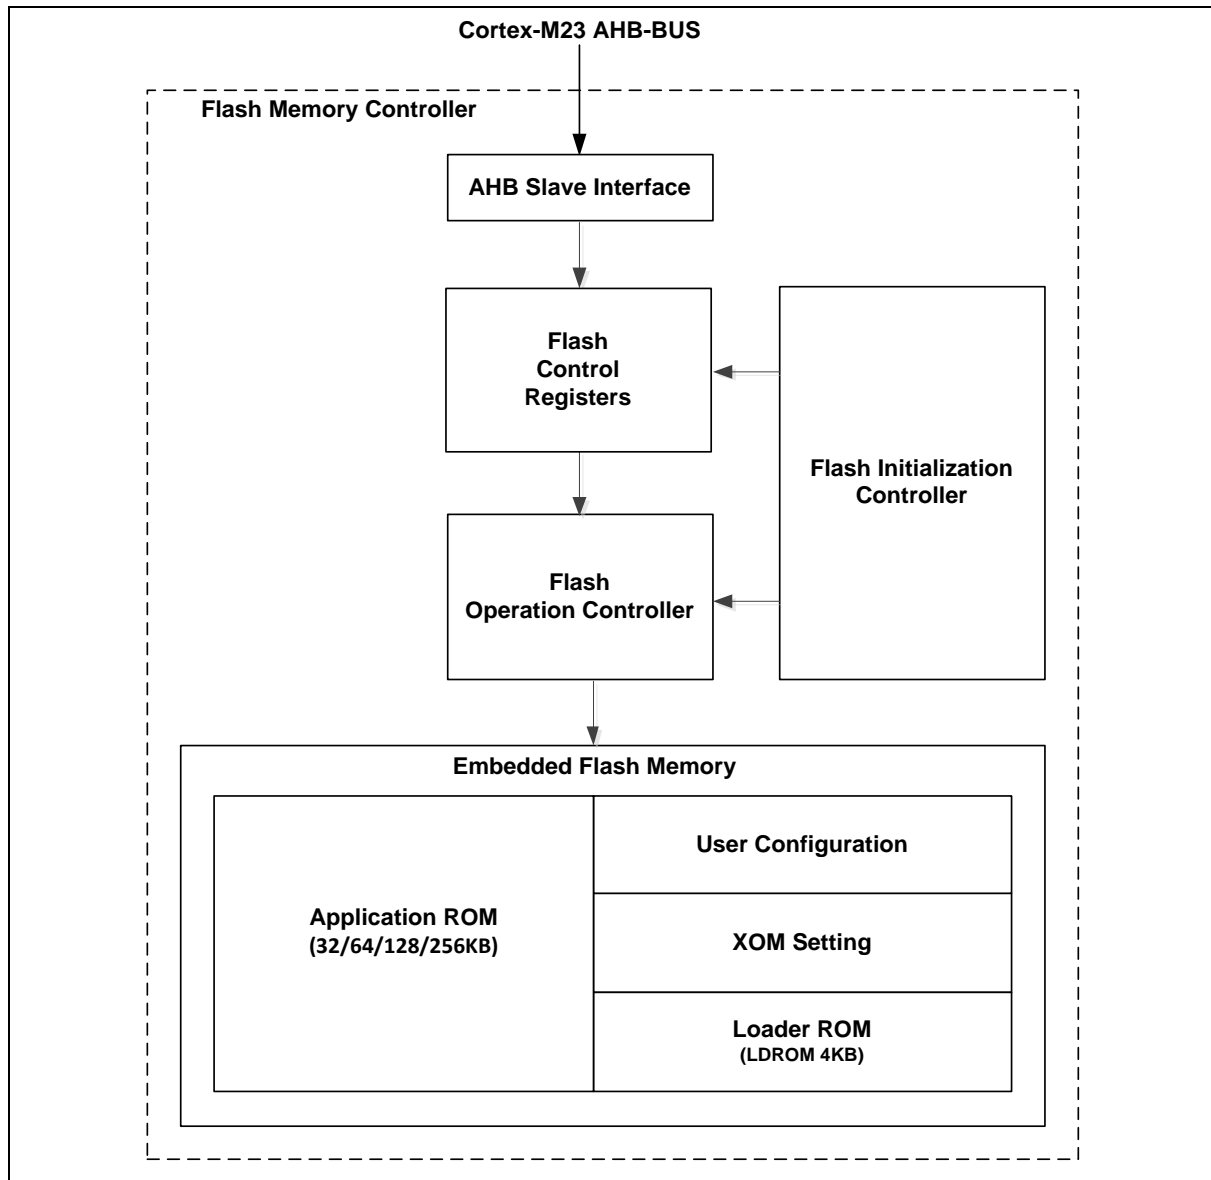

Figure 6.4-1 Flash Memory Controller Block Diagram

AHB Slave Interface

There is one AHB slave interface in Flash memory controller, the bus is from Cortex[®]-M23 AHB-Lite Bus for the instruction and data fetch and Flash control registers access including ISP registers.

Cache Memory Controller

A 512 bytes cache with zero wait cycle is implemented between Cortex[®]-M23 CPU and embedded Flash memory. This cache memory controller improves the Flash access performance and reduces power consumption of the embedded Flash memory.

Flash Control Registers

All of ISP control and status registers are in the Flash control registers. The detail registers description is in the Register Description section.

Flash Initialization Controller

When chip is powered on or active from reset, the Flash initialization controller will start to access Flash automatically and check the Flash stability, and also reload User Configuration content to the Flash control registers for system initiation.

Flash Operation Controller

The Flash operations, such as Flash erase, Flash program, and Flash read operation, have specific control timing for embedded Flash memory. The Flash operation controller generates those control timing by requested from the cache memory controller, the Flash control registers and the Flash initialization controller.

Embedded Flash Memory

The embedded Flash memory is the main memory for user application code and parameters. It consists of the user configuration block, 4 Kbytes LDROM, 512 bytes XOM setting page and 32/64/128/256 Kbytes APROM . The page erase Flash size is 512 bytes, and minimum program bit size is 32 bits.

6.4.4 Functional Description

FMC functions include the memory organization, boot selection, IAP, ISP, the embedded Flash programming, and checksum calculation. The Flash memory map and system memory map are also introduced in the memory organization.

6.4.4.1 Memory Organization

The FMC memory consists of the embedded Flash memory which is programmable, and includes APROM, LDROM, XOM setting pages and the User Configuration block. The address map includes Flash memory map and four system address maps: LDROM with IAP, LDROM without IAP, APROM with IAP and APROM without IAP, functions.

6.4.4.2 LDROM and APROM

LDROM is designed for a loader to implement In-System-Programming (ISP) function by user. LDROM is a 4 Kbytes embedded Flash memory, the Flash address range is from 0x0010_0000 to 0x0010_0FFF. APROM is main memory for user applications. APROM size is 32/64/128/256 Kbytes. The page size of all of the embedded Flash memory is 512 bytes.

6.4.4.3 User Configuration Block

User Configuration block is internal programmable configuration area for boot options, such as Flash security lock, boot select and brown-out voltage level. It works like a fuse for power on setting. It is loaded from Flash memory to its corresponding control registers during chip power on. User can set these bits according to different application requests. User Configuration block can be updated by ISP function and located at 0x0030_0000 with three 32 bits words (CONFIG0, CONFIG1 and CONFIG2). Any change on User Configuration block will take effect after system reboot.

Bits	Descriptions
[31]	<p>Watchdog Timer Hardware Enable Bit</p> <p>When watchdog timer hardware enable function is enabled, the watchdog enable bit WDTEN (WDT_CTL[7]) and watchdog reset enable bit RSTEN (WDT_CTL[1]) is set to 1 automatically after power on. The clock source of watchdog timer is force at LIRC and LIRC can't be disabled in normal operation mode. However, in Power down mode, the LIRC can be disabled by setting CWDTEN[2:0]=011, CWDTPDEN=1 and LIRCEN=0 (CLK_PWRCTL[3]).</p> <p>CWDTEN[2:0] is CONFIG0[31][4][3].</p> <p>011 = WDT hardware enable function is active. WDT clock is always on except chip enters Power-down mode. When chip enter Power-down mode, WDT clock is always on if CWDTPDEN is 0 or WDT clock is controlled by LIRCEN (CLK_PWRCTL[3]) if CWDTPDEN is 1. Please refer to bit field description of CWDTPDEN.</p> <p>111 = WDT hardware enable function is inactive, WDT clock source only can be changed in this case.</p> <p>Others = WDT hardware enable function is active. WDT clock is always on.</p>
[30]	<p>Watchdog Clock Power-down Enable Bit</p> <p>This bit should be used with CWDTEN. When WDT enabled by CWDTEN, Use this bit to control WDT wake-up when system is in Power-down mode. If it is necessary to wake up system by WDT, set CWDTPDEN=0 to make sure WDT keep working in Power-down mode. If user does not want to wake up system by WDT, just set CWDTPDEN=1 and LIRCEN=0 to let WDT suspend in power down.</p> <p>0 = Watchdog Timer clock kept enabled when chip enters Power-down.</p> <p>1 = Watchdog Timer clock is controlled by LIRCEN (CLK_PWRCTL[3]) when chip enters Power-down.</p> <p>Note: This bit only works if CWDTEN[2:0] is set to 011.</p>
[29:24]	Reserved.
[23:21]	<p>Brown-out Voltage Selection</p> <p>000 = Brown-out voltage is 1.8V. 001 = Brown-out voltage is 1.8V. 010 = Brown-out voltage is 2.0V. 011 = Brown-out voltage is 2.4V. 100 = Brown-out voltage is 2.7V. 101 = Brown-out voltage is 3.0V. 110 = Brown-out voltage is 3.7V. 111 = Brown-out voltage is 4.4V.</p>

[20]	CBORST	Brown-out Reset Enable Bit 0 = Brown-out reset Enabled after powered on. 1 = Brown-out reset Disabled after powered on.
[19]	CBODEN	Brown-out Detector Enable Bit 0= Brown-out detect Enabled after powered on. 1= Brown-out detect Disabled after powered on.
[18:13]	Reserved	Reserved.
[12]	ICELOCK	ICE Lock Bit This bit only used to disable ICE function. User may use it with LOCK (CONFIG0[1]) bit to increase security level. 0 = ICE function Disabled. 1 = ICE function Enabled.
[11]	Reserved	Reserved.
[10]	CIOINI	I/O Initial State Selection 0 = All GPIO set as Quasi-bidirectional mode after chip powered on. 1 = All GPIO set as input tri-state mode after powered on.
[9:8]	Reserved	Reserved.
[7:6]	CBS	Chip Booting Selection When CBS[0] = 0, the LDROM base address is mapping to 0x100000 and APROM base address is mapping to 0x0. User could access both APROM and LDROM without boot switching. In other words, if IAP mode is supported, the code in LDROM and APROM can be called by each other. CBS value is valid when MBS =1. 00 = Boot from LDROM with IAP mode. 01 = Boot from LDROM without IAP mode. 10 = Boot from APROM with IAP mode. 11 = Boot from APROM without IAP mode. Note: BS (FMC_ISPCTL[1]) only works on CBS[0] = 1.VECMAP function only works on CBS[0] = 0.
[5]	Reserved	Reserved.
[4:3]	CWDTEN[1:0]	Watchdog Timer Hardware Enable Bit Please refer to CWDTEN[2] (CONFIG0[31]) for detail description.
[2]	Reserved	Reserved.
[1]	LOCK	Security Lock Control This bit is used to enable security lock function. If security lock function enabled, only the software in APROM and LDROM could read correct data. Any other way, e.g. ICE, will get 0xffffffff when read APROM and LDROM. 0 = Flash memory content is locked. 1 = Flash memory content is not locked.
[0]	Reserved	Reserved.

6.4.4.4 Execution Only Memory (XOM)

The execution only memory (XOM) is used to store instructions for security application which are not allowed for data access via AHB-Bus. There is only one XOM region in APROM (XOM0). To define a new XOM region, user must complete XOM settings in XOM setting page (0x20_0000 ~ 0x20_0008)via In-System-Programming (ISP) function. XOMR0BASE is used to define XOM region start address and XOMR0SIZE is used to define total page size of XOM region. Both XOMR0BASE and XOMR0SIZE must be page alignment. XOMR0CTRL is used to define the XOM region attribute, which can be defined as active, inactive or debug mode. After setting and restarting Flash initialization by any reset except CPU reset and MCU reset, user can check XOM status from FMC_XOMSTS and check each XOM range (i.e. base and size) from FMC_XOMR0STS. User needs to do chip reset after setting or erasing XOM.

When using XOM setting page and XOM regions, users must pay attention to the following limitations:

- XOM region cannot be programmed after finishing its XOM setting
- XOM setting cannot be changed during runtime
- Only use Flash 32-bit program command to program XOM setting page
- Clear XOM setting and XOM region by mass erase command or XOM page erase function (a special erase command for XOM)
- User must restart Flash initialization to activate any new XOM setting
- ICE can not step in XOM region except debug mode, otherwise ICE will disconnect

Once the XOM region is active, user can only adopt mass erase command or XOM page erase function to clear XOM region and its corresponding XOM setting. To execute XOM page erase function, user must perform FLASH Page Erase (0x22) by writing the base address of the target XOM region in FMC_ISPADDR and the constant value 0x0055aa03 in FMC_ISPDAT. User should not set XOM at region where chip can boot from.

6.4.4.5 Flash Memory Map

The Flash memory map is different from system memory map. The system memory map is used by CPU fetch code or data from FMC memory. The Flash memory map is used for ISP function to read, program or erase FMC memory. The Flash memory map is as Figure 6.4-2.

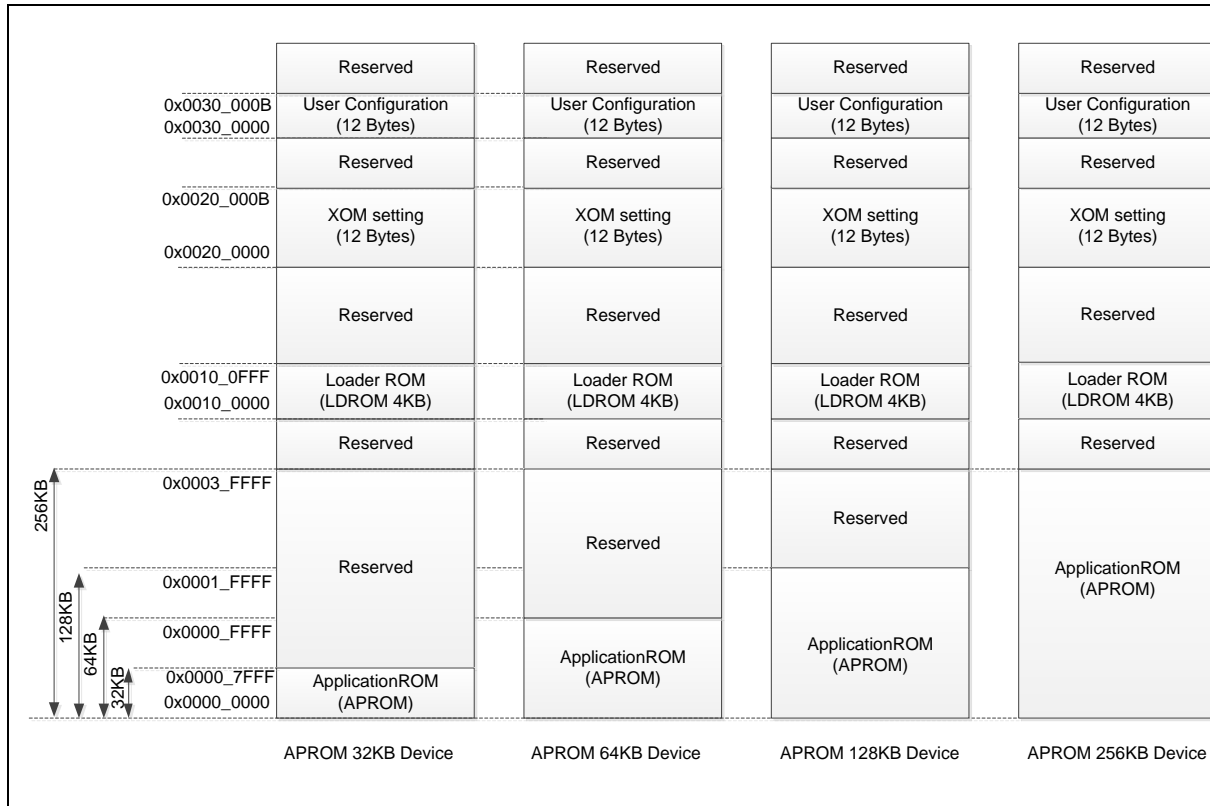

Figure 6.4-2 Flash Memory Map

6.4.4.6 System Memory Map with IAP Mode

The system memory map is used by CPU to fetch code or data from Flash memory. In IAP mode, CPU can read and execute the code from APROM and LDROM. It also supports to call the functions in LDROM from APROM or call the function in APROM from LDROM. That is why it is called IAP mode.

The address from 0x0000_0000 to 0x0000_01FF is called vector.map space. The vector map consists of a vector table for stack and exceptions. By remapping the vector table in APROM or LDROM to the vector map space, it is possible to reboot to different applications.

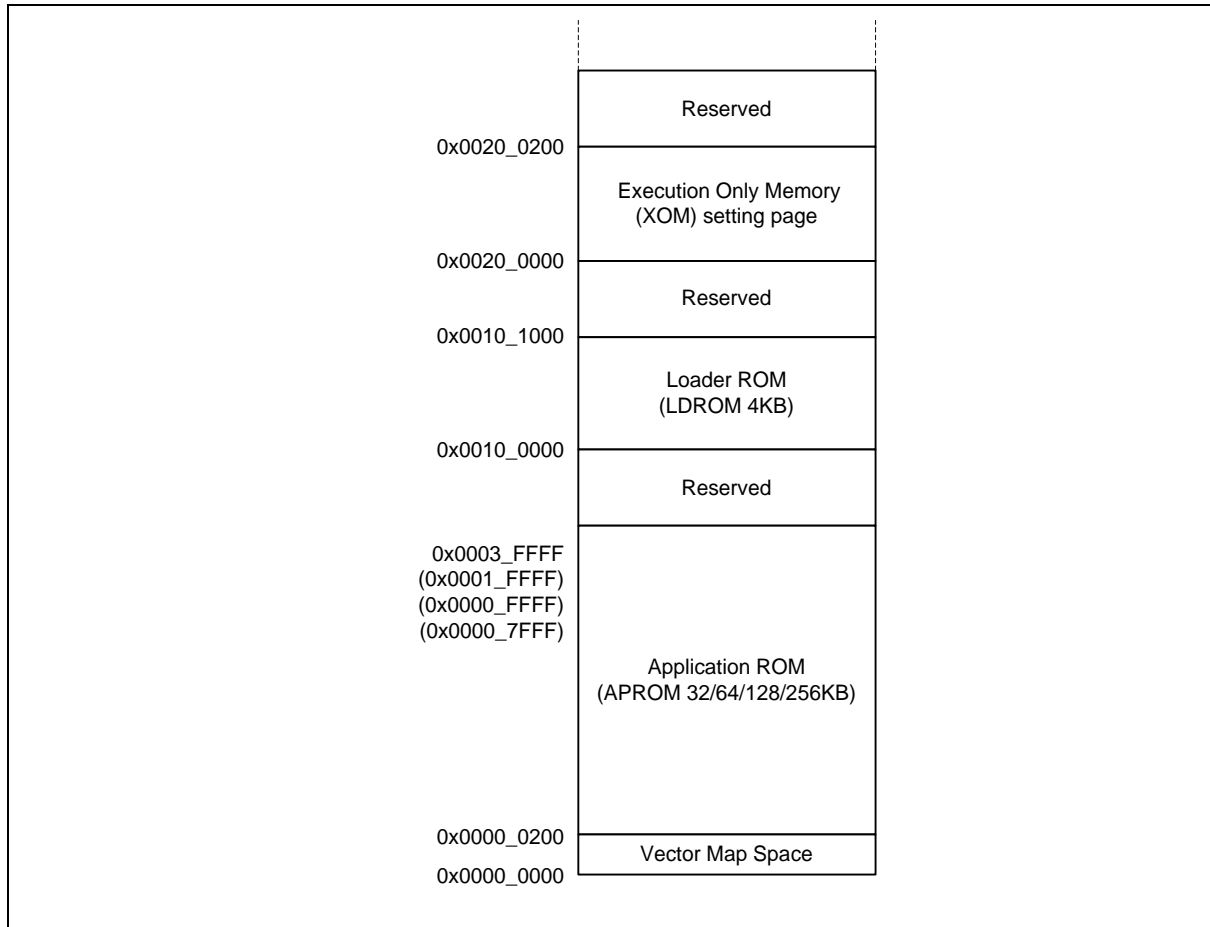

Figure 6.4-3 System Memory Map with IAP Mode

There are two kinds of system memory map with IAP mode when chip booting: (1) LDROM with IAP, (2) APROM with IAP.

In APROM with IAP mode, the vector map of APROM (0x0000_0000~0x0000_01FF) is mapping to the vector map space. Therefore, when CPU reset or System Reset Request reset, the stack pointer and reset handler in APROM vector table are used to reboot the system. This is so called boot from APROM.

In LDROM with IAP mode, the vector table of LDROM(0x0010_0000~0x0010_01FF) is mapping to the vector map space. Therefore, when CPU reset or System Reset Request reset, the stack pointer and reset handler in LDROM vector table are used to reboot the system. This is so called boot from LDROM.

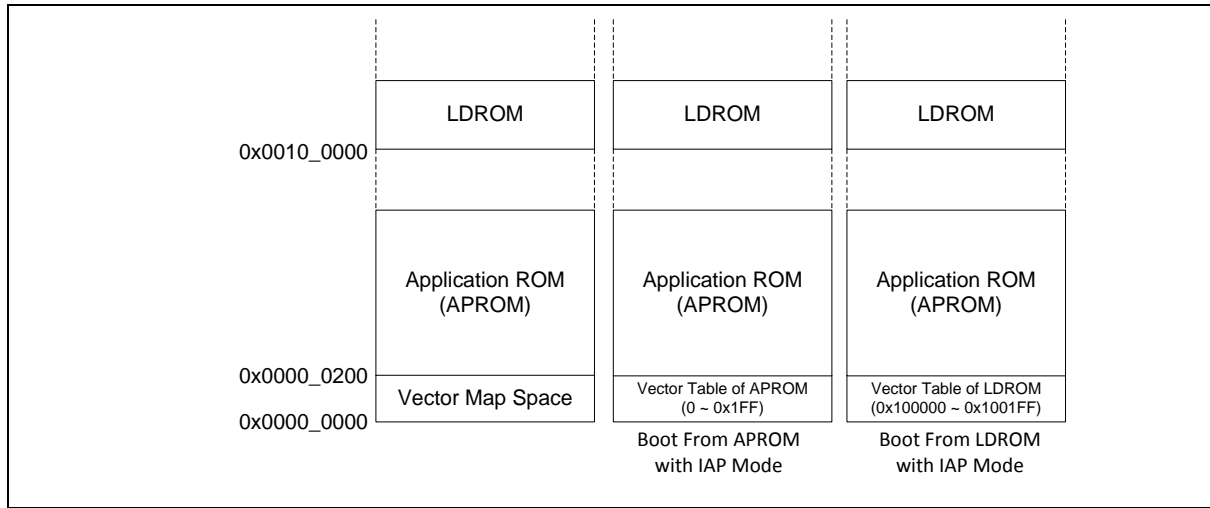

Figure 6.4-4 APROM/LDROM Boot with IAP Mode

The vector map space not only can map from vector table of APROM or LDROM. User can also map any 512 bytes alignment space of APROM, LDROM or SRAM to vector map space. To set vector map space mapping, user should write the target remap address to FMC_ISPADDR register and then trigger ISP procedure with the “Vector Page Remap” command (0x2E). The final system memory vector mapping address is shown on VECMAP (FMC_ISPSTS[29:9]). Please note that the vector mapping function only valid in IAP mode.

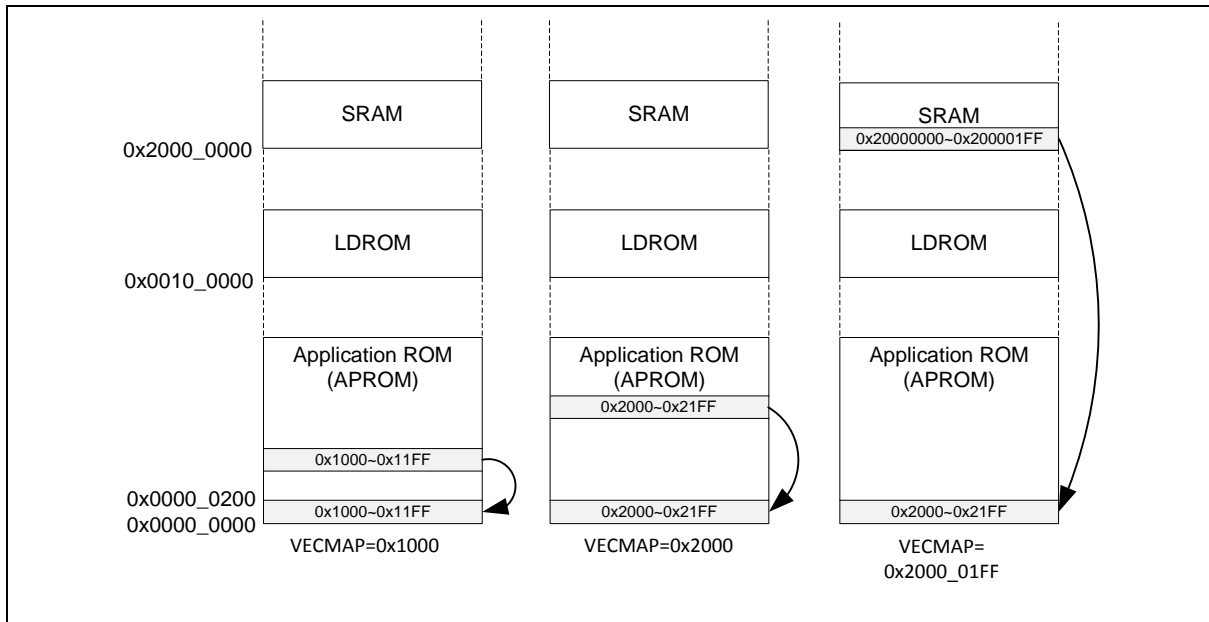

Figure 6.4-5 VECMAP Setting Example in IAP Mode

6.4.4.7 System Memory Map without IAP Mode

In system memory map without IAP mode, the system memory vector mapping is not supported. There are two kinds of system memory map without IAP mode when chip booting: (1)LDROM without IAP, (2) APROM without IAP.

In LDROM without IAP mode, LDROM base is mapping to 0x0000_0000. CPU cannot read or execute code from APROM. In other words, APROM is absent in the system memory map of LDROM without

IAP.

In APROM without IAP mode, APROM base is mapping to 0x0000_0000. CPU cannot read or execute code from LDROM. In this mode, LDROM is absent for current system memory map.

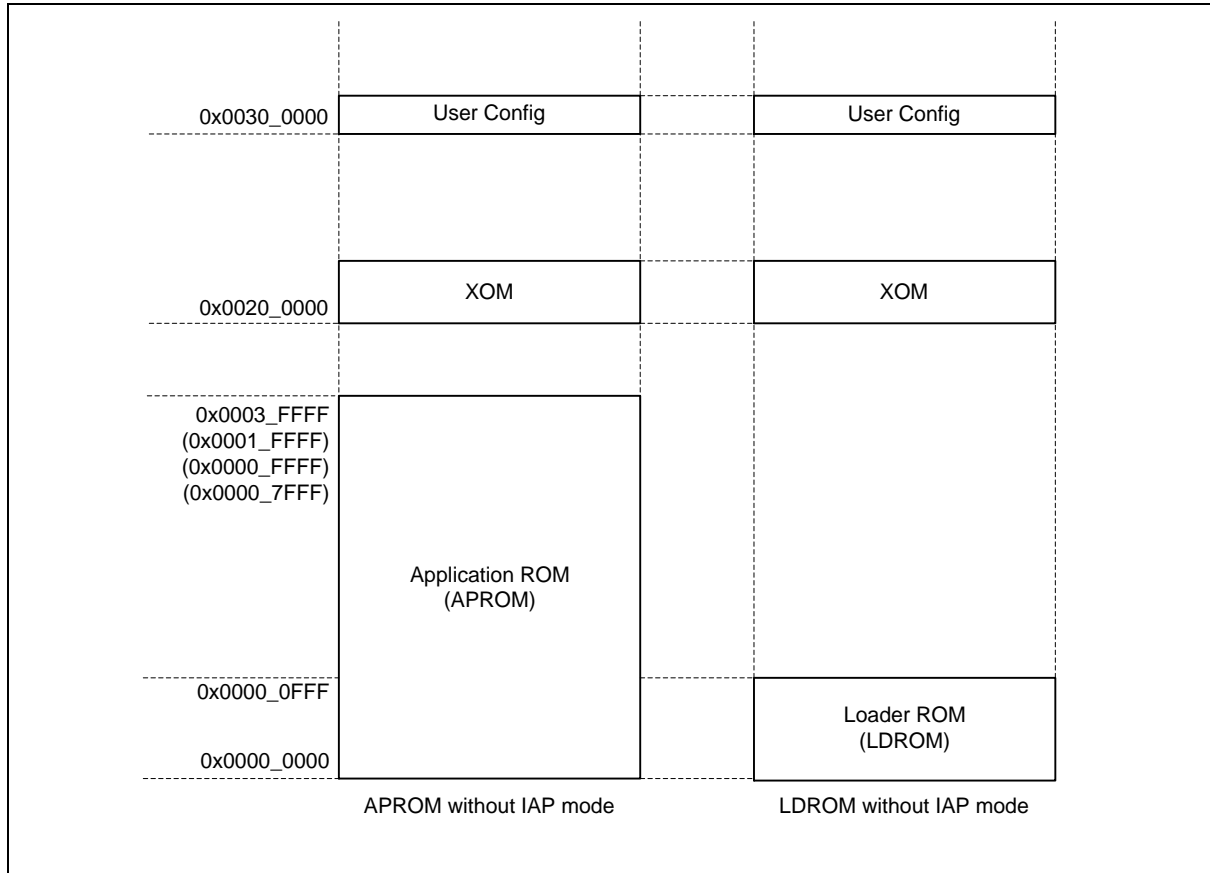

Figure 6.4-6 System Memory Map without IAP mode

6.4.4.8 Boot Selection

This chip provides four booting sources for user to select, including LDROM with IAP, LDROM without IAP, APROM with IAP and APROM without IAP. The booting source and system memory map are setting by CBS (CONFIG0[7:6]). The vector mapping function only supported in IAP mode, i.e, APROM with IAP and LDROM with IAP.

CBS[1:0]	Boot Selection/System Memory Map	Vector Mapping Supporting
00	LDROM with IAP	Yes
01	LDROM without IAP	No
10	APROM with IAP	Yes
11	APROM without IAP	No

Table 6.4-1 Boot Source Selection Table

6.4.4.9 In-Application-Programming (IAP)

In-Application-Programming (IAP) mode for user to switch the code executing between APROM, LDROM. User can enable the IAP mode by booting chip and setting the chip boot selection bits in CBS (CONFIG0[7:6]) as 2b'10 or 2'b00.

When chip boots with IAP function is enabled, any executable code (align to 512 bytes) is allowed to map to the system memory vector. User can change the remap address to FMC_ISPADDR and then trigger ISP procedure with the "Vector Page Remap" command (0x2E).

6.4.4.10 In-System-Programming (ISP)

In-System-Programming (ISP) function allowing the embedded Flash memory to be reprogrammed under software control. ISP is performed without addition devices and just utilize on-chip connectivity interface, such as UART, USB, I²C and SPI. Table 6.4-2 lists all supported ISP commands .Including command code, address and data limitations.

ISP provides the following functions for embedded Flash memory.

- Supports Flash page erase function
- Supports Flash data program function
- Supports Flash data read function
- Supports company ID read function
- Supports device ID read function
- Supports unique ID read function
- Supports memory CRC32 checksum calculation function
- Supports Flash all one verification function
- Supports system memory vector remap function

ISP Commands

ISP Command	FMC_ISPCMD	FMC_ISPADDR	FMC_ISPDAT FMC_MPDAT0~ FMC_MPDAT3
Flash Page Erase	0x22	Valid address of Flash memory. It must be page alignment.	N/A or 0x0055AA03 if page erase XOM.
Flash 32-bit Program	0x21	Valid address of Flash memory. It must be word alignment.	FMC_ISPDAT :Programming Data FMC_MPDAT0~FMC_MPDA T3 : N/A
FLASH Multi-Word Program	0x27	Valid address of Flash memory organization. It must be 32-bit alignment.	FMC_ISPDAT :N/A FMC_MPDAT0: 1'st Programming Data FMC_MPDAT1: 2'nd Programming Data FMC_MPDAT2: 3'rd Programming Data FMC_MPDAT3: 4'th Programming Data

Flash 32-bit Read	0x00	Valid address of Flash memory organization It must be word alignment.	FMC_ISPDAT: Return Data FMC_MPDAT0~FMC_MPDA T3 : N/A
Read Company ID	0x0B	0x0000_0000	FMC_ISPDAT: 0x0000_00DA
Read Device ID	0x0C	0x0000_0000	FMC_ISPDAT: Return Device ID
Read Checksum	0x0D	Keep address of "Run Checksum Calculation"	FMC_ISPDAT: Return Checksum
Run Checksum Calculation	0x2D	Valid start address of memory organization It must be 512 bytes page alignment	FMC_ISPDAT: Size It must be 512 bytes alignment
Run Flash All One Verification	0x28	Valid start address of memory organization It must be 512 bytes page alignment	FMC_ISPDAT: Size It must be 512 bytes alignment
Read Unique ID	0x04	0x0000_0000	FMC_ISPDAT: Unique ID Word 0
		0x0000_0004	FMC_ISPDAT: Unique ID Word 1
		0x0000_0008	FMC_ISPDAT: Unique ID Word 2
Vector Remap	0x2E	Valid address in APROM, LDROM or SRAM with 512 bytes alignment	N/A

Table 6.4-2 ISP Command List

ISP Procedure

The FMC controller provides embedded Flash memory read, erase and program operation. Several control bits of FMC control register are write-protected, thus it is necessary to unlock before setting.

After unlocking the protected register bits, user needs to set the FMC_ISPCTL control register to decide to update LDROM, APROM or user configuration block, and then set ISPEN (FMC_ISPCTL[0]) to enable ISP function. .

Once the FMC_ISPCTL register is set properly, user can set FMC_ISPCMD (refer to Table 6.4-2 ISP command list) for specify operation. Set FMC_ISPADDR for target Flash memory based on Flash memory organization. FMC_ISPDAT can be used to set the data to program or used to return the read data according to FMC_ISPCMD. For Checksum calculation and All-One Verification commands, FMC_ISPDAT is used to define the size for calculation or verification.

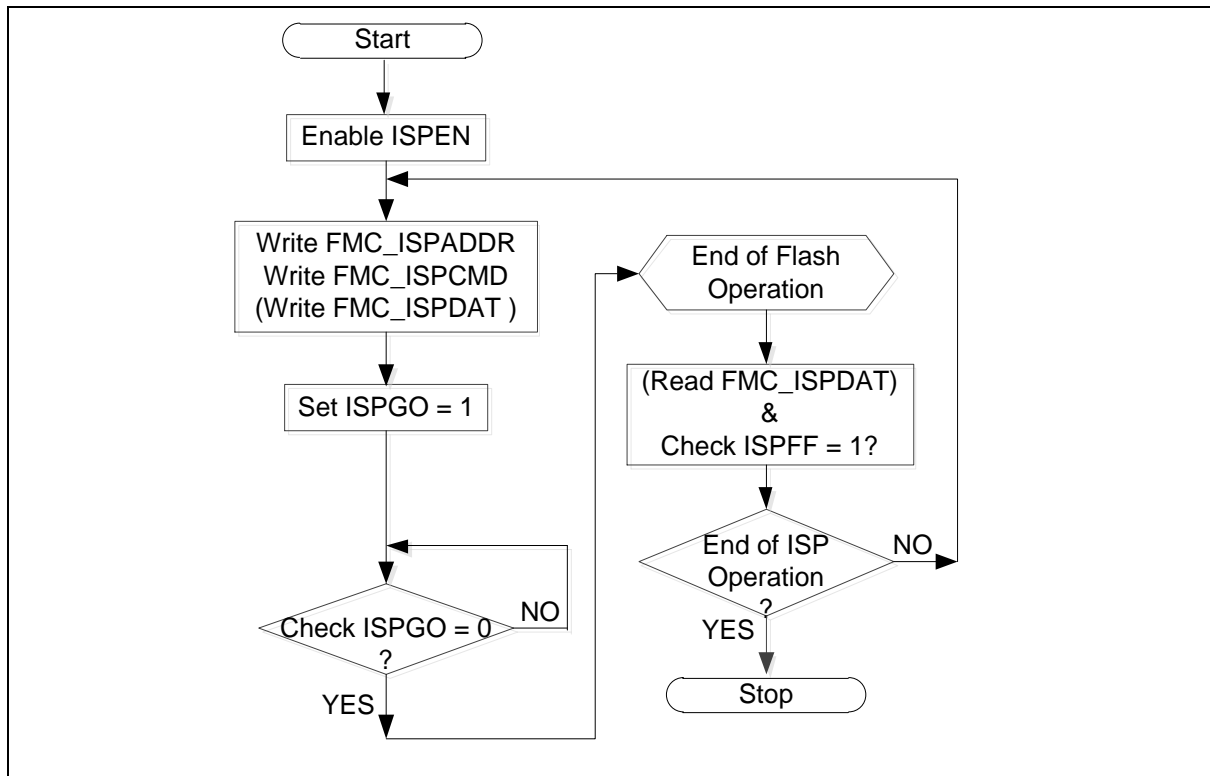

Figure 6.4-7 ISP Procedure Example

Finally, set the ISPGO (FMC_ISPTRG[0]) register to perform the relative ISP function. When ISP function is active, the ISPBUSY(FMC_ISPSTS[0]) and MPBUSY(FMC_MPSTS[0]) be set to 1. The ISPGO(FMC_ISPTRG[0]), ISPBUSY(FMC_ISPSTS[0]) and MPBUSY(FMC_MPSTS[0]) are self-cleared when ISP function has been done.

Several error conditions will be checked after ISP is completed. If an error condition occurs, ISP operation is not started and the ISP fail flag will be set instead. ISPPFF(FMC_ISPSTS[6]) flag can only be cleared by software. The next ISP procedure can be started even ISPPFF(FMC_ISPSTS[6]) bit is kept as 1. Therefore, it is recommended to check the ISPPFF(FMC_ISPSTS[6]) bit and clear it after each ISP operation if it is set to 1.

While FMC is processing ISP command, CPU will be halt to wait ISP done if CPU trying to access Flash memory. For example, if any interrupt request occurs, CPU will not service it till ISP operation is finished. User could move their code and exception handlers to SRAM to avoid this situation. the peripheral still keeps working as usual when ISP processing.

When ISP operation is finished, the ISPGO bit will be cleared by hardware automatically. User can check whether ISP operation is finished or not by the ISPGO(FMC_ISPTRG[0]) bit.

6.4.4.11 VECMAP for Interrupt and Memory Programming

Accelerate Interrupt by VECMAP

In IAP mode, VECMAP function could be used to map 512 bytes SRAM to vector map space. It means it is possible to store all exception vectors to SRAM. Then, if any exceptions assert, CPU can read exception handler from SRAM with zero wait state to speed up exception latency.

Because the vector map space is fixed to be 512 bytes, user must copy all 512 bytes to SRAM before remapping SRAM to vector map space. Otherwise, CPU may get wrong data from vector map space after remapping. Figure 6.4-8 shows an example to accelerating interrupt by VECMAP.

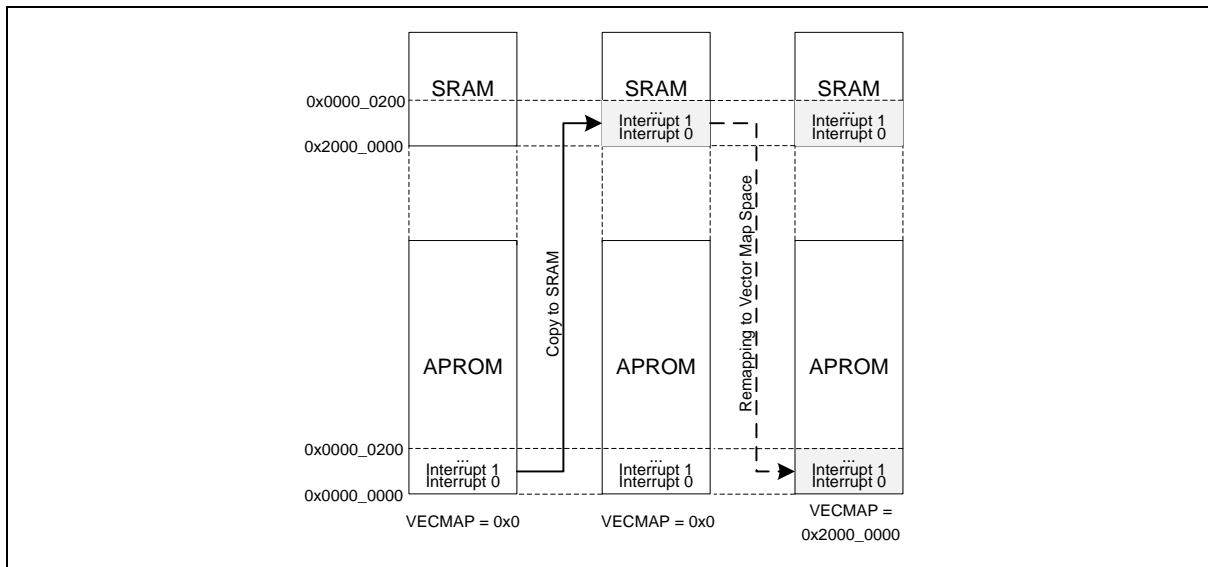

Figure 6.4-8 Example for Accelerating Interrupt by VECMAP

Avoid CPU Holt When Flash Programming

When Flash memory controller is in busy, any CPU access to Flash memory will cause CPU holt for waiting Flash controller ready. If Flash controller is busy in page erasing, it may cause CPU holt for a long time to erase pages. To avoid this situation, user needs to avoid CPU access Flash memory when page erasing. The easiest way is to execute code in SRAM and use VECMAP to map all exceptions to SRAM. By executing code in SRAM, CPU will not access Flash to get instructions. By mapping all exceptions to SRAM, all interrupts won't need to get exception handler from Flash memory.

6.4.4.12 Embedded Flash Memory Programming

This chip provides 32-bit and multi-word Flash memory programming function to speed up Flash updated procedure. Table 6.4-3 lists required FMC control registers in each embedded Flash programming function.

Register	Description	32-Bit Programming	Multi-Word Programming
FMC_ISPCTL	ISP Control Register	√	√
FMC_ISPADDR	ISP Address Register	√	√
FMC_ISPDAT	ISP Data Register	√	N/A
FMC_ISPCMD	ISP CMD Register	0x21	0x27
FMC_ISPTRG	ISP Trigger Register	√	√
FMC_ISPSTS	ISP Status Register	√	N/A
FMC_MPDAT0	ISP Data0 Register	N/A	√
FMC_MPDAT1	ISP Data1 Register	N/A	√
FMC_MPDAT2	ISP Data2 Register	N/A	√
FMC_MPDAT3	ISP Data3 Register	N/A	√
FMC_MPSTS	ISP Multi-Program status	N/A	√
FMC_MPADDR	ISP Multi-Program Address	N/A	√

Table 6.4-3 FMC Control Registers for Flash Programming

FMC_ISPDAT is used for 32-bit programming data register. Figure 6.4-9 shows ISP 32-bit programming procedure.

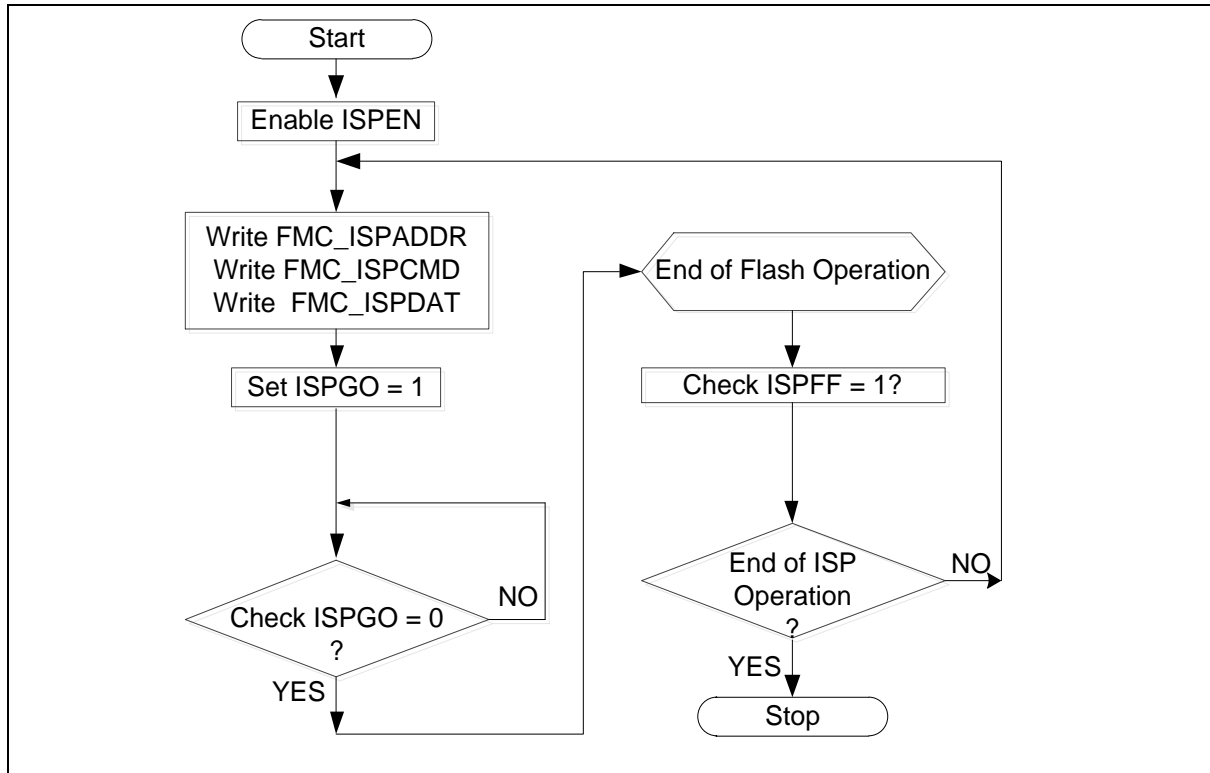

Figure 6.4-9 ISP 32-bit Programming Procedure

Multi-word Programming

This chip supports multi-word programming function to speed up Flash updated procedure. The maximum programming length is up to 128 bytes, and the minimum programming length is 4 bytes (1 words). The multi-word programming is the fastest programming function if the programming words more than 4 bytes.

In multi-word programming operation, Cortex[®]-M23 CPU has to monitor the empty status of the programming buffer. CPU has to prepare the next data for programming continuity. The multi-program firmware should not be located in APROM or LDROM, because CPU instruction fetch cannot be hold during ISP processing. The firmware has to be located in embedded SRAM of chip to avoid CPU hold. The multi-word programming code also needs to make sure all exceptions won't access Flash memory when ISP processing. Please note that, when doing multi-word programming, HCLK must select clock source from HIRC and frequency not lower than 4 MHz.

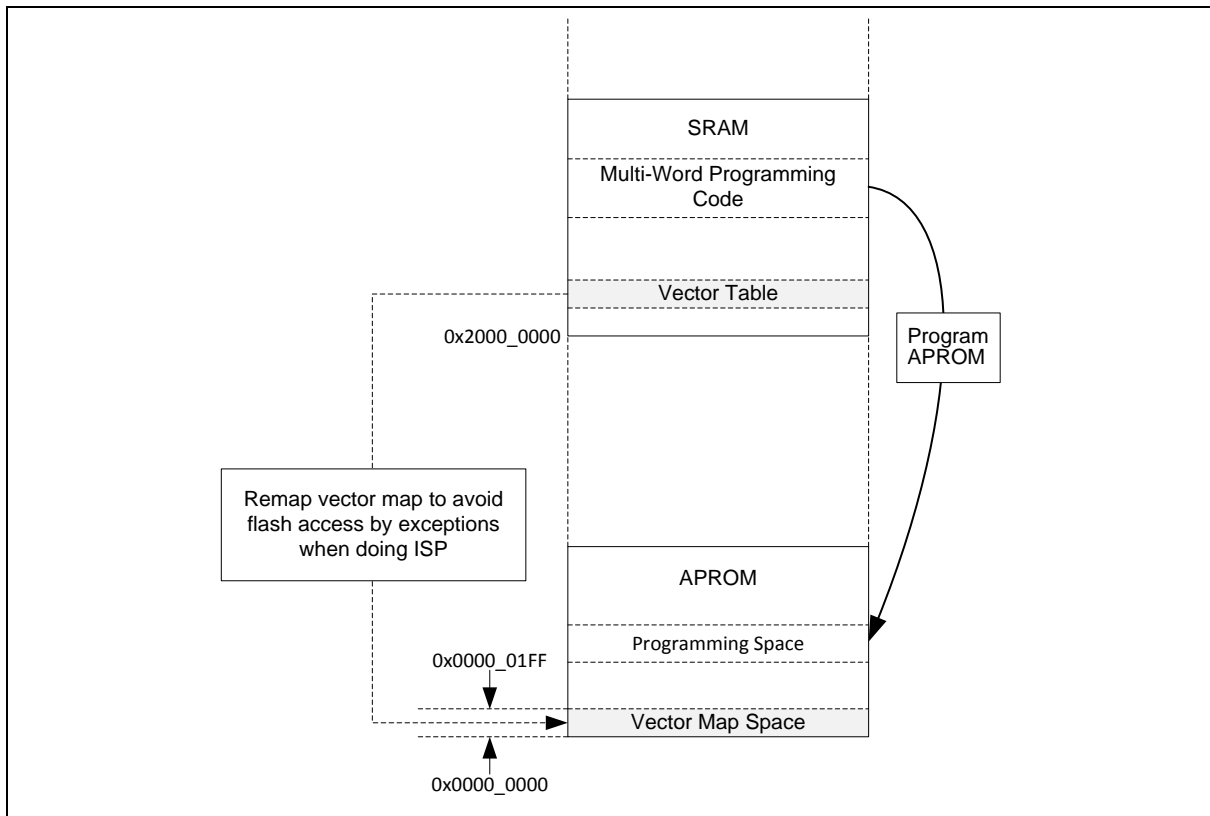

Figure 6.4-10 Firmware in SRAM for Multi-word Programming

The multi-word programming flow is shown in . The starting ISP address (FMC_ISPADDR) has to be 4-byte align. FMC_MPDATA0 is the data word of the offset 0x0, FMC_MPDATA1 is the second word (offset 0x4), FMC_MPDATA2 is the third word (offset 0x8), and FMC_MPDATA3 is forth word (offset 0xC). If the starting ISP address FMC_ISPADDR [3] is 0, the 1st data word should put on FMC_MPDATA0, and 2nd word is FMC_MPDATA1, 3rd word is FMC_MPDATA2, and 4th word is FMC_MPDATA3. If the starting ISP address FMC_ISPADDR [3] is 1, the 1st data word should put on FMC_MPDATA2, and 2nd word is FMC_MPDATA3, 3rd word is FMC_MPDATA0, and 4th word is FMC_MPDATA1. The maximum programming size is 128 bytes. While FMC controller performs multi-word programming operation, CPU needs to monitor the buffer status D3~D0(FMC_MPSTS[7:4]) and MPBUSY (FMC_MPSTS[0]) to wait any one buffer empty, and then CPU needs to update the next programming data (FMC_MPDATA0, FMC_MPDATA1, FMC_MPDATA2 and FMC_MPDATA3) before D3~D0 all equal to 0. Otherwise, FMC controller will exit multi-word programming operation (MPBUSY (FMC_MPSTS[0]) = 0). If CPU cannot update the data in time (MPBUSY (FMC_MPSTS[0]) =0), CPU needs restart a new multi-word programming procedure to continue, FMC_MPADDR provides the last program address information. At the end of operation, CPU has to check ISPFF (FMC_MPSTS[2]) to confirm the multi-word operation successful complete.

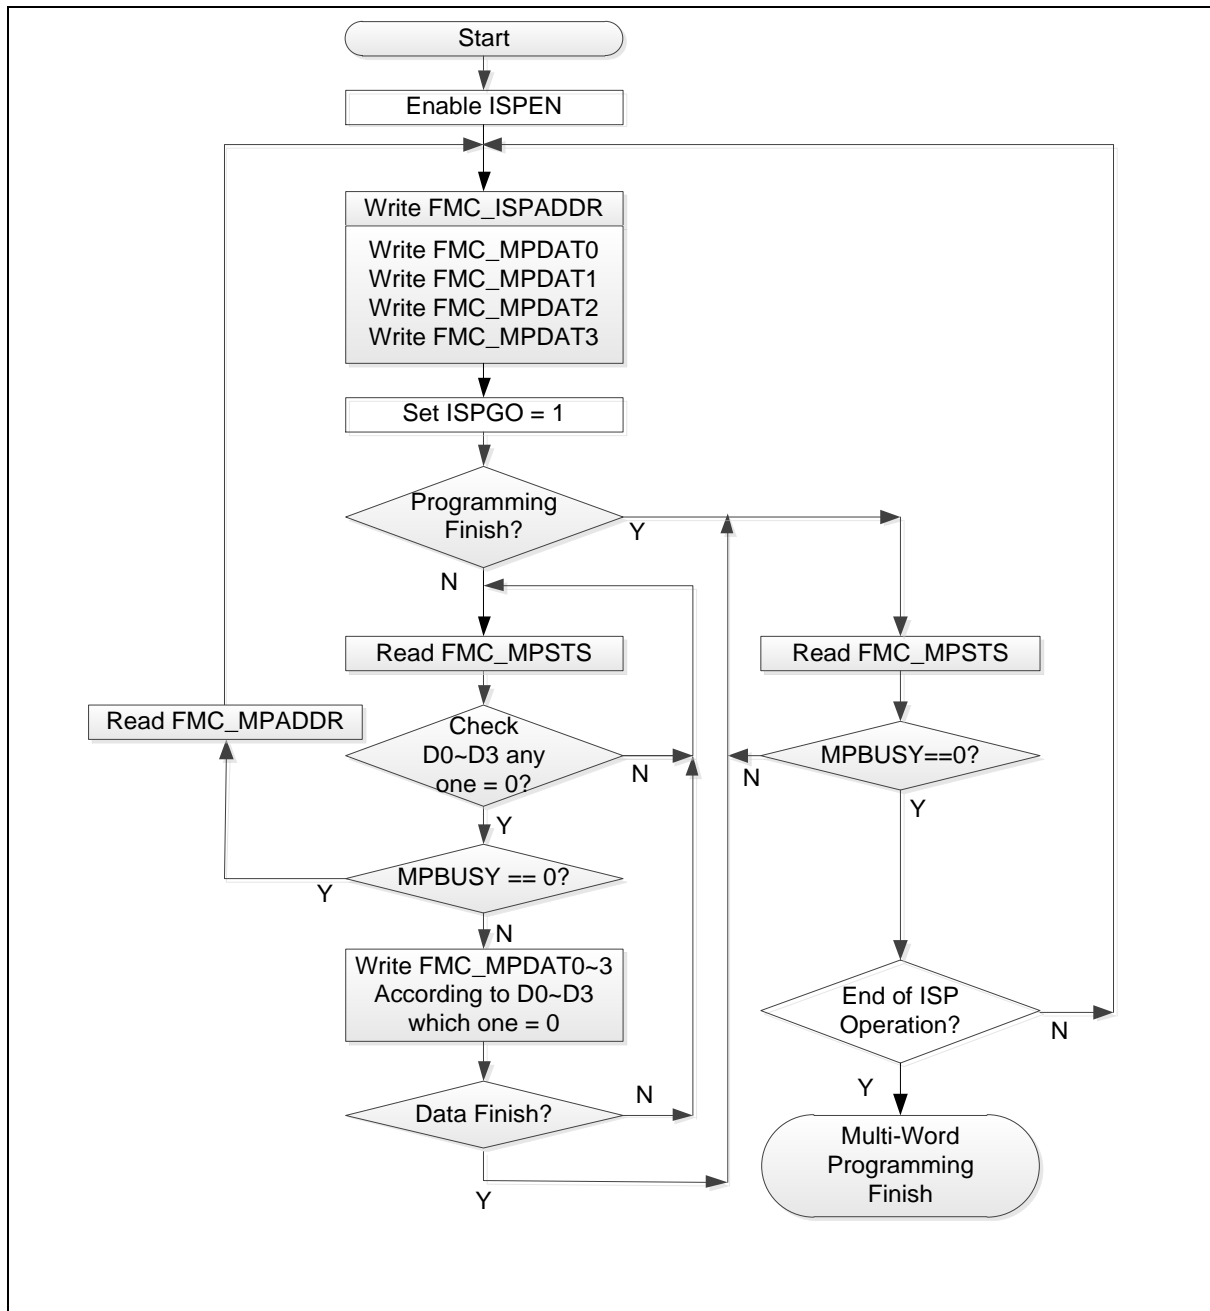

Figure 6.4-11 Multi-word Programming Flow

6.4.4.13 Fast Flash Programming Verification

In traditional Flash programming operation, the controller receives the programming trigger event then control the timing to perform the programming embedded Flash memory as show in Figure 6.4-12.

This chip supports the fast Flash programming verification function, which provides hardware verification for Flash programming to save time of the CPU read back and comparison. When data is programmed to the embedded Flash memory, the controller asserts the Flash read operation to read data out, and performs data comparison with data in. Finally, the comparison result is saved in PGFF (FMC_ISPSTS[5]). The PGFF is set to 1 if output data is not the same as the input programming data. The flag is kept until clear by software or a new erase operation. The fast Flash programming verification flow is shown in Figure 6.4-12.

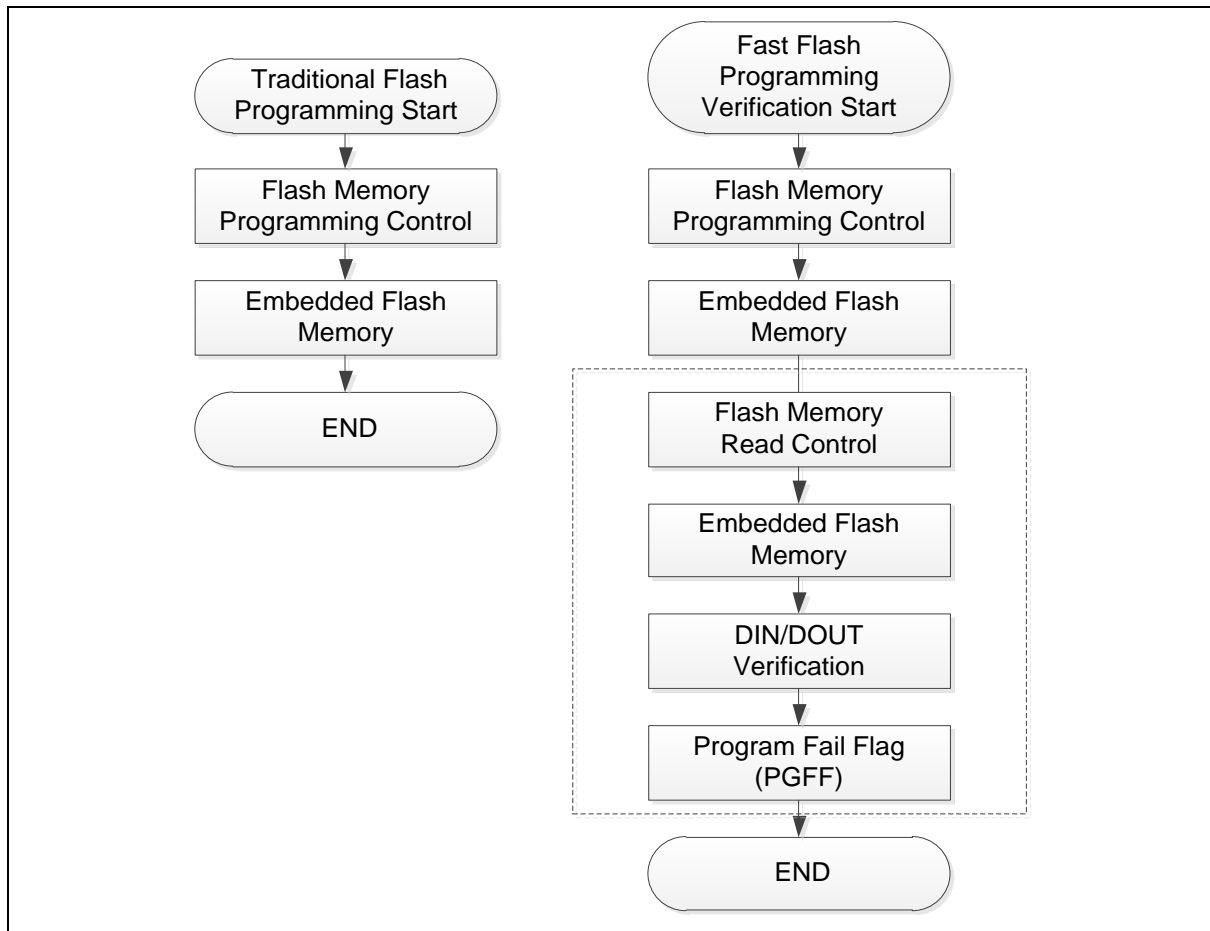

Figure 6.4-12 Fast Flash Programming Verification Flow

In traditional Flash updated operation, the Flash memory has to perform three steps to complete the Flash memory updated procedure, (1) Flash ERASE (2) Flash PROGRAM (3) Flash READ back all of data to check the correction. In this chip, it only reads FMC_ISPSTS to check PGFF flag in Step (3) without reading data back to confirm. compares traditional programming verification flow and fast programming verification flow.

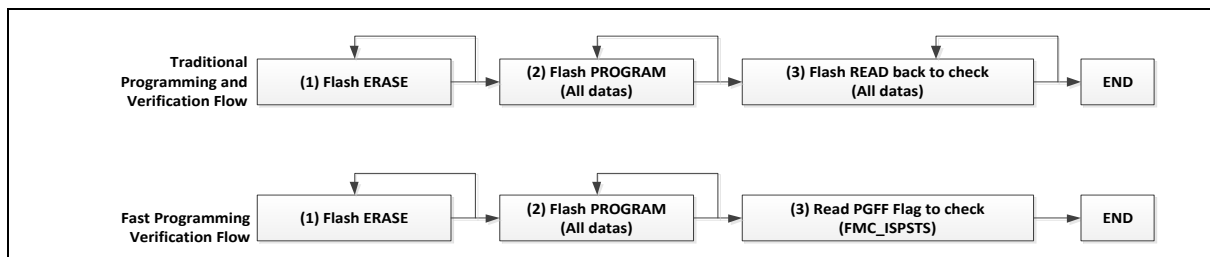

Figure 6.4-13 Verification Flow

The fast Flash programming verification function is released for 32-bit programming, but multi-word programming operation is not suitable due to the embedded Flash HV (High Voltage) of continue programming.

6.4.4.14 CRC32 Checksum Calculation

This chip supports the CRC32 checksum calculation, and help user quickly check the memory content includes APROM and LDROM. The CRC32 polynomial is

CRC-32 : $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$
 With seed = 0xFFFF_FFFF

The CRC32 checksum calculation flow is shown in .

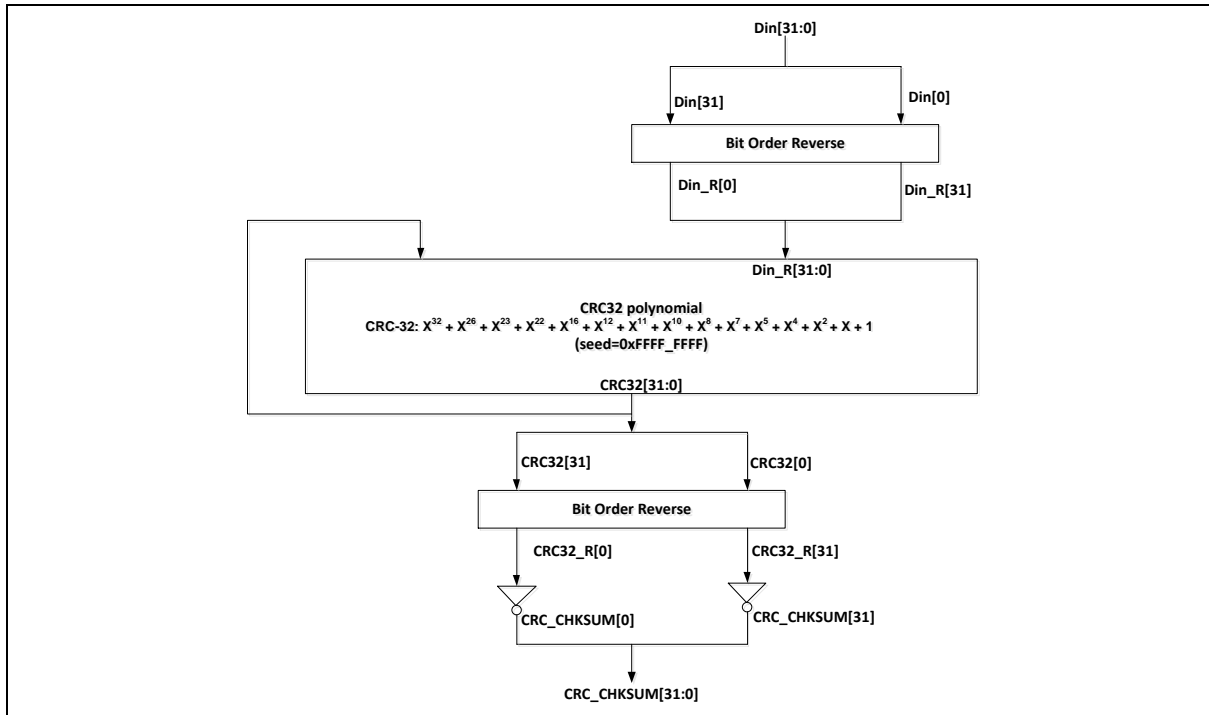

Figure 6.4-14 Flash CRC32 Checksum Calculation

Three steps complete this CRC32 checksum calculation.

1. Step 1.Perform ISP “Run Memory CRC32 Checksum” operation
2. Step 2.Perform ISP “Read Memory CRC32 Checksum” operation
3. Step 3.Read FMC_ISPDAT to get checksum.

In Step 1, user has to set the memory starting address (FMC_ISPADDR) and size (FMC_ISPDAT) to calculate. Both address and size have to be 4 Kbytes alignment, the size should be ≥ 4 Kbytes and the starting address includes APROM and LDROM.

In Step 2, the FMC_ISPADDR should be kept as the same as Step 1.

In Step 3, the checksum is read from FMC_ISPDAT. If the checksum is 0x0000_0000, there is one of two conditions (1) Checksum calculation is in-progress, (2) Address and size is over device limitation

When Flash is locked, user can still calculate the CRC of the data in Flash. It is usefull for checking data currupt or data retention issue under Flash security lock mode or XOM active mode

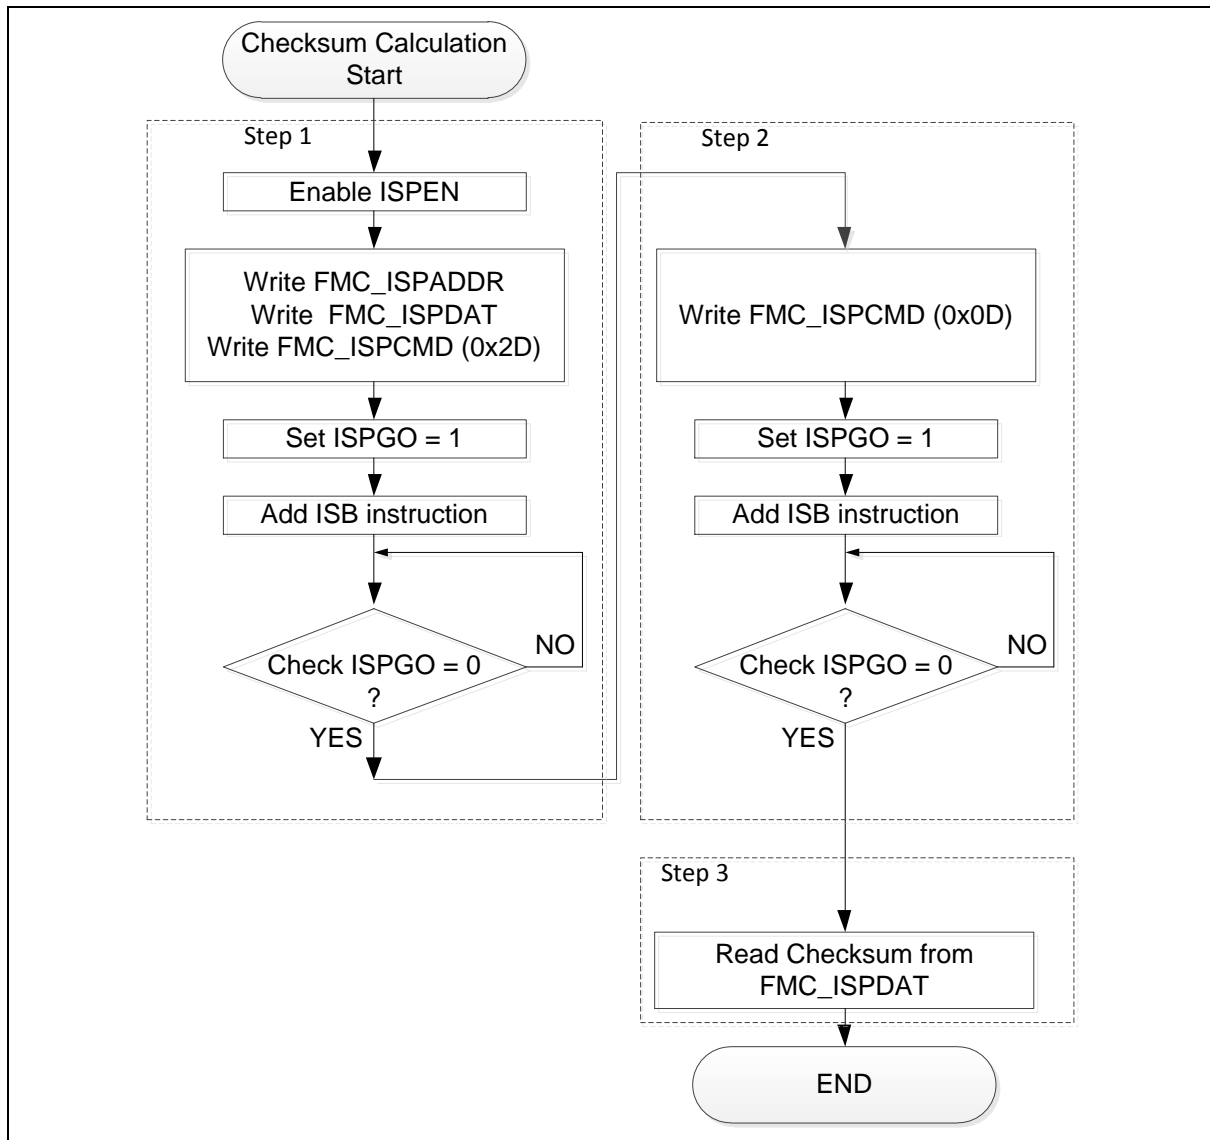

Figure 6.4-15 CRC-32 Checksum Calculation Flow

6.4.4.15 Flash All One Verification

This chip supports the Flash all one verification function to help user quickly check a memory block content blanking for APROM and LDROM after Flash erase operation.

Two steps complete this Flash all one verification.

Two-step flow:

1. Step 1. Perform ISP “Run Flash All One Verification” operation
2. Step 2. Read ALLONE(FMC_ISPSTA[7]) bit to get the verification result
 - ALLONE: 1, all of Flash bits are 1 in verification block memory.
 - ALLONE: 0, Flash bits are not all 1 in verification block memory.

In Step 1, user has to set the memory starting address (FMC_ISPADDR) and size (FMC_ISPDAT) to verify. Both address and size have to be 512 bytes alignment, the size should be ≥ 512 bytes and the

starting address includes APROM and LDROM.

In Step 2, the FMC_ISPADDR should be kept as the same as Step 1.

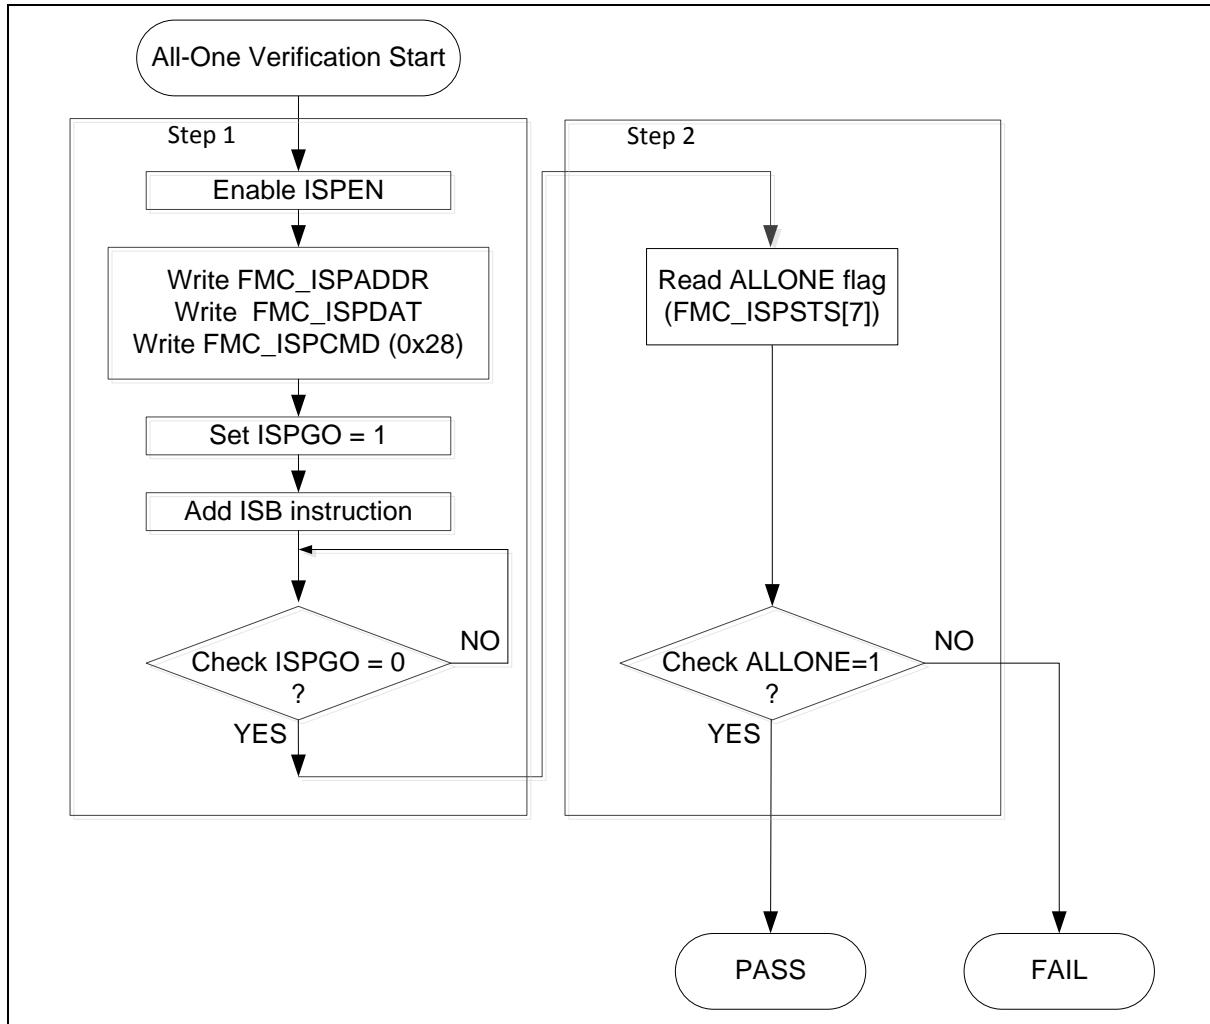

Figure 6.4-16 All-One Verification Flow

6.5 General Purpose I/O (GPIO)

6.5.1 Overview

This chip has up to 85 General Purpose I/O pins to be shared with other function pins depending on the chip configuration. These 85 pins are arranged in 6 ports named as PA, PB, PC, PD, PE, and PF. PA, PB and PE has 16 pins on port. PC has 14 pins on port, PD has 15 pins on port. PF has 8 pins on port. Each of the 85 pins is independent and has the corresponding register bits to control the pin mode function and data.

The I/O type of each of I/O pins can be configured by software individually as Input, Push-pull output, Open-drain output or Quasi-bidirectional mode. After the chip is reset, the I/O mode of all pins are depending on CIOINI (CONFIG0[10]). Each I/O pin has a very weakly individual pull-up resistor which is about 50 k Ω . Please refer to the M251 Datasheet for detailed pin operation voltage information about V_{DD} , V_{DDIO} and V_{BAT} electrical characteristics.

6.5.2 Features

- Four I/O modes:
 - Quasi-bidirectional mode
 - Push-Pull Output mode
 - Open-Drain Output mode
 - Input only with high impedance mode
- TTL/Schmitt trigger input selectable
- I/O pin can be configured as interrupt source with edge/level setting
- Supports High Drive and High Slew Rate I/O mode
- Configurable default I/O mode of all pins after reset by CIOINI (CONFIG0[10]) setting
 - CIOINI = 0, all GPIO pins in Quasi-bidirectional mode after chip reset
 - CIOINI = 1, all GPIO pins in input mode after chip reset
- Support independent pull-up and pull-down control
- Enabling the pin interrupt function will also enable the wake-up function
- Improve access efficiency by using single cycle I/O bus

6.5.3 Block Diagram

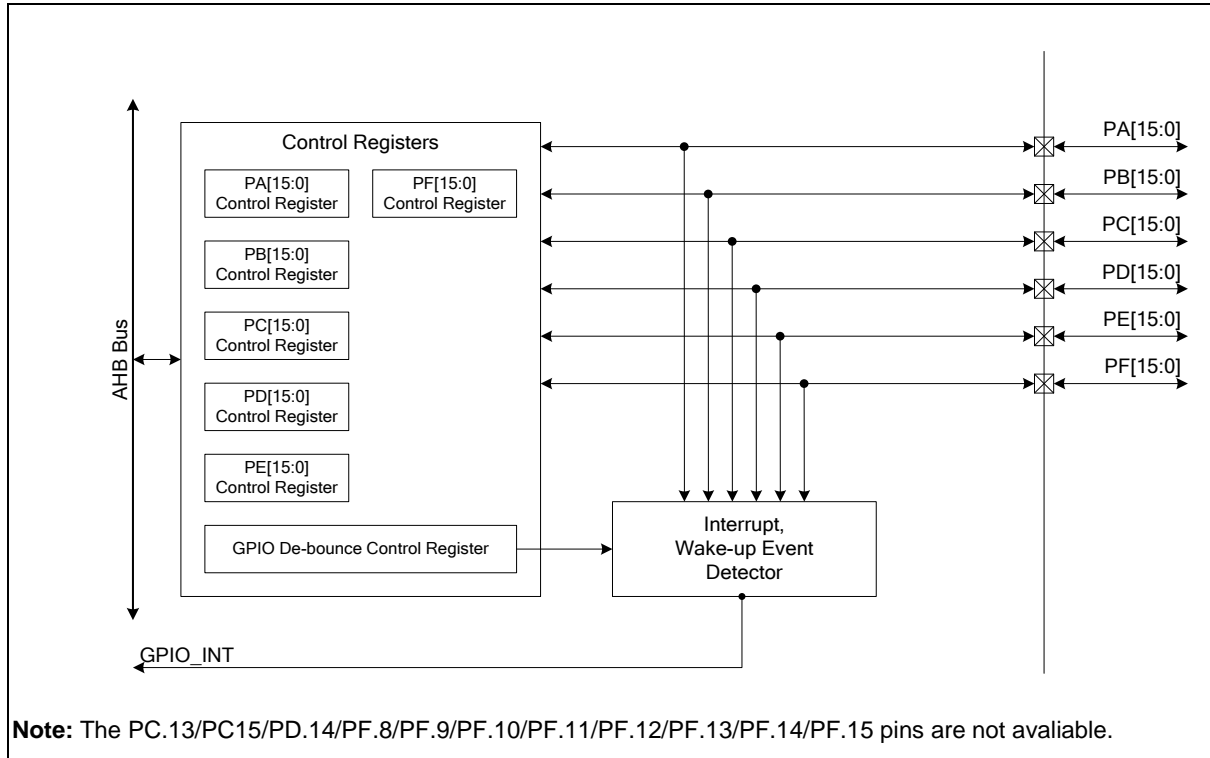

Figure 6.5-1 GPIO Controller Block Diagram

6.5.4 Basic Configuration

- Reset configuration
 - Reset GPIO in GPIORST SYS_IPRST1[1]
- Pin configuration

Group	Pin Name	GPIO	MFP
INT0	INT0	PA.6, PB.5	MFP15
INT1	INT1	PA.7, PB.4, PD.15	MFP15
INT2	INT2	PB.3, PC.6	MFP15
INT3	INT3	PB.2, PC.7	MFP15
INT4	INT4	PB.6	MFP13
		PA.8	MFP15
INT5	INT5	PB.7	MFP13
		PD.12	MFP15

6.5.5 Functional Description

6.5.5.1 Input Mode

Set MODE_n (Px_MODE[2n+1:2n]) to 00 as the Px.n pin is in Input mode and the I/O pin is in tri-state (high impedance) without output drive capability. The PIN (Px_PIN[n]) value reflects the status of the

corresponding port pins.

Each I/O pin includes an internal resistor. Set (Px_PUSEL[2n+1:2n]) to 01 to enable internal pull-up resistor and (Px_PUSEL[2n+1:2n]) to 10 to enable internal pull-down resistor. Setting both pull-up/down is not available.

Figure 6.5-2 Input Mode

6.5.5.2 Push-pull Output Mode

Figure 6.5-3 shows the diagram of Push-pull Output Mode. Set MODEn (Px_MODE[2n+1:2n]) to 01 as Px.n pin is in Push-pull Output mode and the I/O pin supports digital output function with source/sink current capability. The bit value in the corresponding DOUT (Px_DOUT[n]) is driven on the pin.

Figure 6.5-3 Push-Pull Output

6.5.5.3 Open-drain Mode

Figure 6.5-4 shows the diagram of Open-drain Mode. Set MODEn (Px_MODE[2n+1:2n]) to 10 the Px.n pin is in Open-drain mode and the digital output function of I/O pin supports only sink current capability, an external pull-up register is needed for driving high state. If the bit value in the corresponding DOUT (Px_DOUT[n]) bit is 0, the pin drive a low output on the pin. If the bit value in the corresponding DOUT (Px_DOUT[n]) bit is 1, the pin output drives high that is controlled by external pull high resistor.

Each I/O pin includes an internal resistor. Set (Px_PUSEL[2n+1:2n]) to 01 to enable internal pull-up

resistor. Only pull-up is available in Open-drain mode.

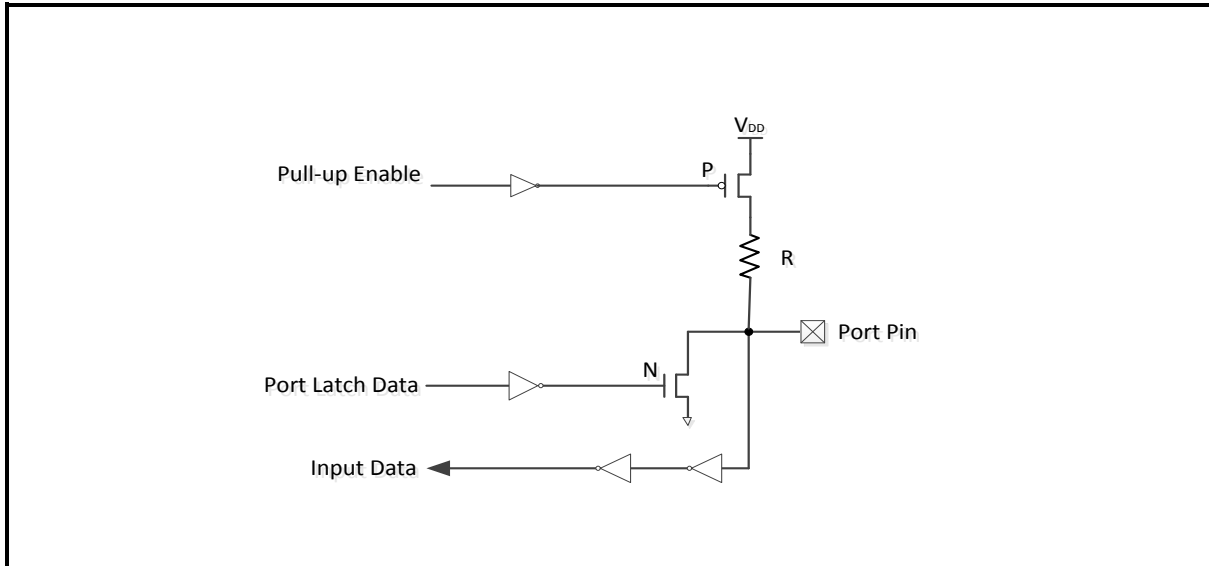

Figure 6.5-4 Open-Drain Output

6.5.5.4 Quasi-bidirectional Mode

Figure 6.5-5 shows the diagram of Quasi-bidirectional Mode. Set MODE_n (Px_MODE[2n+1:2n]) to 11 as the Px.n pin is in Quasi-bidirectional mode and the I/O pin supports digital output and input function at the same time but the source current is only up to hundreds uA. Before the digital input function is performed the corresponding DOUT (Px_DOUT[n]) bit must be set to 1. The quasi-bidirectional output is common on the 80C51 and most of its derivatives. If the bit value in the corresponding DOUT (Px_DOUT[n]) bit is 0, the pin drive a low output on the pin. If the bit value in the corresponding DOUT (Px_DOUT[n]) bit is 1, the pin will check the pin value. If pin value is high, no action takes. If pin state is low, the pin will drive strong high with 2 clock cycles on the pin and then disable the strong output drive. Meanwhile, the pin status is controlled by internal pull-up resistor. Note that the source current capability in quasi-bidirectional mode, please refer to the M251 Datasheet for detailed information.

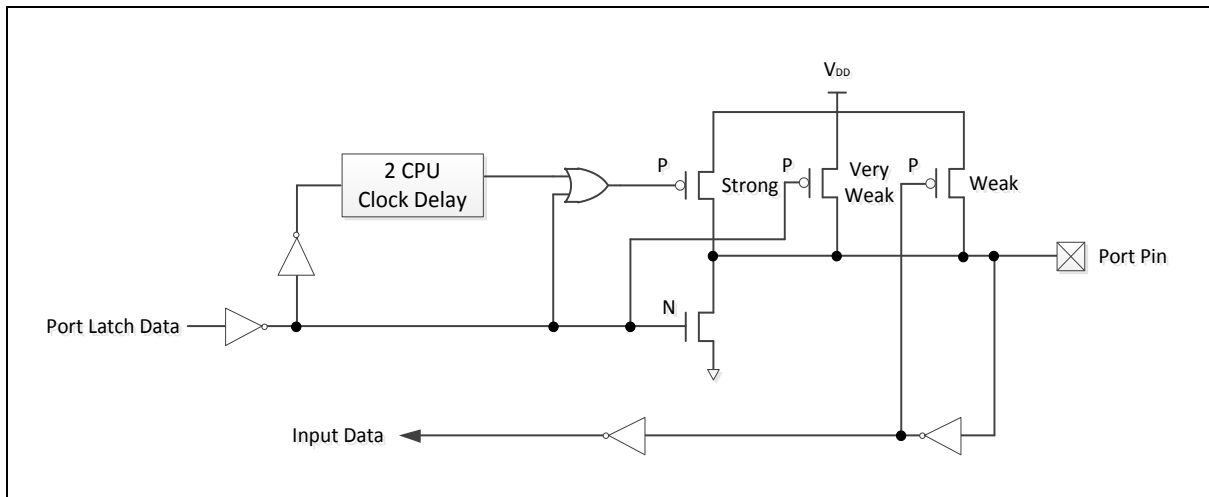

Figure 6.5-5 Quasi-Bidirectional I/O Mode

6.5.5.5 GPIO Interrupt and Wake-up Function

Each GPIO pin can be set as chip interrupt source by setting correlative RHIEN (Px_INTEN[n+16])/ FLIEN (Px_INTEN[n]) bit and TYPE (Px_INTTYPE[n]). There are five types of interrupt condition can be selected: low level trigger, high level trigger, falling edge trigger, rising edge trigger and both rising and

falling edge trigger. The GPIO can also be the chip wake-up source when chip enters Idle/Power-down mode. The setting of wake-up trigger condition is the same as GPIO interrupt trigger.

6.5.5.6 GPIO De-bounce Function

GPIO de-bounce function can be used to sample interrupt input for each GPIO pin and prevent unexpected interrupt happened which caused by noise. GPIO de-bounce function only support edge detection trigger type. For edge trigger condition, there are three types of interrupt condition can be selected for de-bounce function: falling edge trigger, rising edge trigger and both rising and falling edge trigger. If user wants to use de-bounce function, de-bounce enable control register Px_DBEN must be set for corresponding GPIO pin. The de-bounce clock source can be HCLK or LIRC (38.4 kHz) by setting DBCLKSRC (Px_DBCTL[4]) register. And DBCLKSEL (Px_DBCTL[3:0]) register can control sampling cycle period.

Figure 6.5-5 shows GPIO rising edge trigger interrupt. The interval of time between the two valid sample signal is determined by DBCLKSRC (Px_DBCTL[4]) and DBCLKSEL (Px_DBCTL[3:0]). Each valid data from GPIO pin need to be sample twice. For rising edge setting, if pin status is low before setting DBEN (Px_DBEN), interrupt will happen when generating a pin high valid data. But, if pin status is high before setting DBEN (Px_DBEN), interrupt will happen when generating a pin low valid data first, and then generating a pin high valid data. For falling edge trigger, Figure 6.5-6 shows the situation is opposite to rising edge trigger.

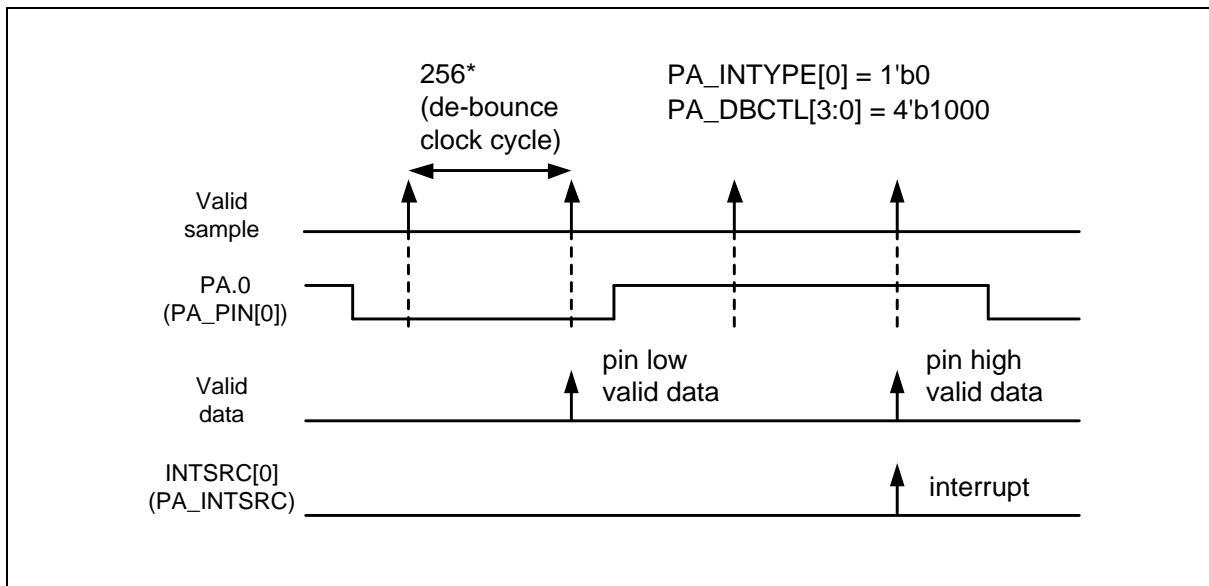

Figure 6.5-6 GPIO Rising Edge Trigger Interrupt

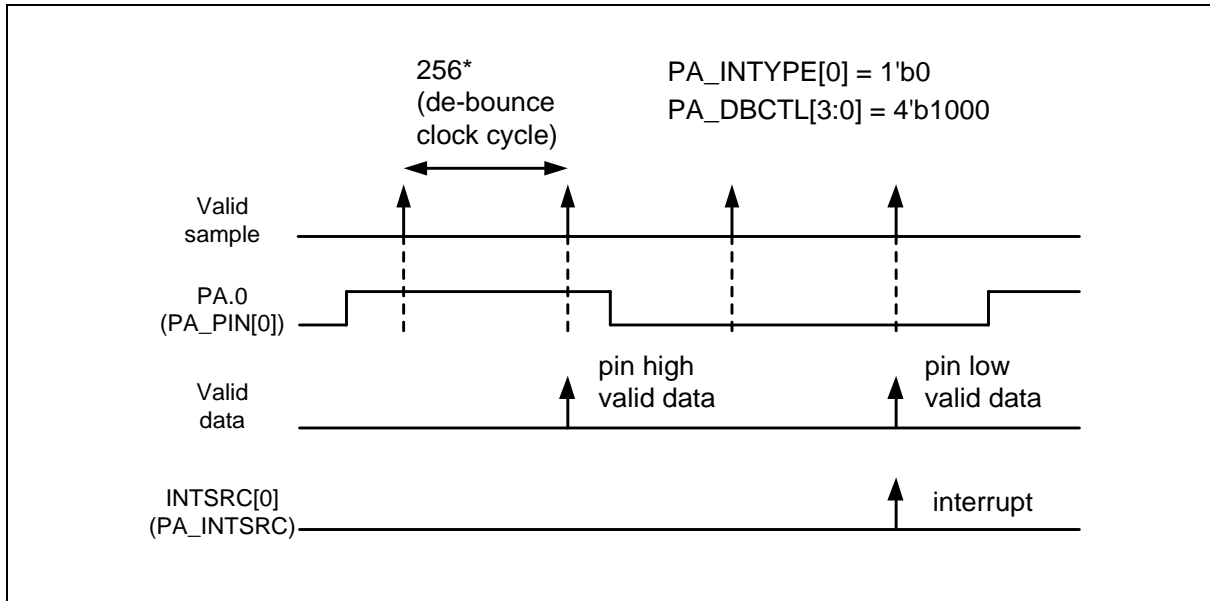

Figure 6.5-7 GPIO Falling Edge Trigger Interrupt

GPIO de-bounce function are also supported in Power-down mode. Table 6.5-1 shows the de-bounce function support situation in different system status. The de-bounce function can support in Power-down mode by setting $DBENn(Px_DBEN[n])$ and $DBCLKSRC(Px_DBCTL[4])$ to 1. $DBCLKSEL(Px_DBCTL[3:0])$ can be set to control the GPIO de-bounce time to wake up system.

System Status	DBEN	DBCLKSRC	Description
Normal Mode / Idle Mode	0	0	No de-bounce function
		1	No de-bounce function
	1	0	De-bounce function using HCLK
		1	De-bounce function using LIRC (38.4 kHz)
Power down Mode	0	0	No de-bounce function
		1	No de-bounce function
	1	0	No de-bounce function
		1	De-bounce function using LIRC (38.4 kHz)

Table 6.5-1 De-Bounce Function Setting Table

6.5.5.7 GPIO Digital Input Path Disable Control

User can disable GPIO digital input path by setting $DINOFF(Px_DINOFF[n+16])$. When GPIO digital input path is disabled, the digital input pin value PIN ($Px_PIN[n]$) is tied to low. By the way, the GPIO digital input path is force disabled by hardware and $DINOFF$ control is useless when I/O function configure as ADC/ACMP/ext. XTL

Read this register to get GPIO pin status. For example, writing PA0_PDIO will reflect the written value to bit DOUT (Px_DOUT[0]), reading PA0_PDIO will return the value of PIN (PA_PIN[0]).</p> <p>Note 1: The writing operation will not be affected by register DATMSK (Px_DATMSK[n]). Note 2: The PC.13/PC.15/PD.14/PF.8~15 pin is ineffective.</p>

6.6 PDMA Controller (PDMA)

6.6.1 Overview

The peripheral direct memory access (PDMA) controller is used to provide high-speed data transfer. The PDMA controller can transfer data from one address to another without CPU intervention. This has the benefit of reducing the workload of CPU and keeps CPU resources free for other applications. The PDMA controller has a total of 8 channels and each channel can perform transfer between memory and peripherals or between memory and memory.

6.6.2 Features

- Supports up to 8 independently configurable channels
- Supports selectable 2 level of priority (fixed priority or round-robin priority)
- Supports transfer data width of 8, 16, and 32 bits
- Supports source and destination address increment size can be byte, half-word, word or no increment
- Request source can be from software,PSIO , SPI/I²S, UART , USCI, EADC,DAC,PWM capture event and TIMER
- Supports Scatter-gather mode to perform sophisticated transfer through the use of the descriptor link list table
- Supports single and burst transfer type
- Supports time-out function on channel 0 and channel1
- Supports stride function from channel 0 to channel 5

6.6.3 Block Diagram

Figure 6.6-1 PDMA Controller Block Diagram

6.6.4 Basic Configuration

- Clock Source Configuration
 - Enable PDMA controller clock in PDMACKEN(CLK_AHBCLK [1]).

- Reset Configuration
 - Reset PDMA controller in PDMARST (SYS_IPRST0[2]).

6.6.5 Functional Description

The PDMA controller transfers data from one address to another without CPU intervention. The PDMA controller supports 8 independent channels and serves only one channel at one time, as the result, PDMA controller supports two level channel priorities: fixed and round-robin priority, PDMA controller serves channel in order from highest to lowest priority channel. The PDMA controller supports two operation modes: Basic mode and Scatter-gather mode. Basic mode is used to perform one descriptor table transfer. Scatter-gather mode has more entries for each PDMA channel, and thus the PDMA controller supports sophisticated transfer through the entries. The descriptor table entry data structure contains many transfer information including the transfer source address, transfer destination address, transfer count, burst size, transfer type and operation mode. Figure 6.6-2 shows the diagram of descriptor table (DSCT) data structure.

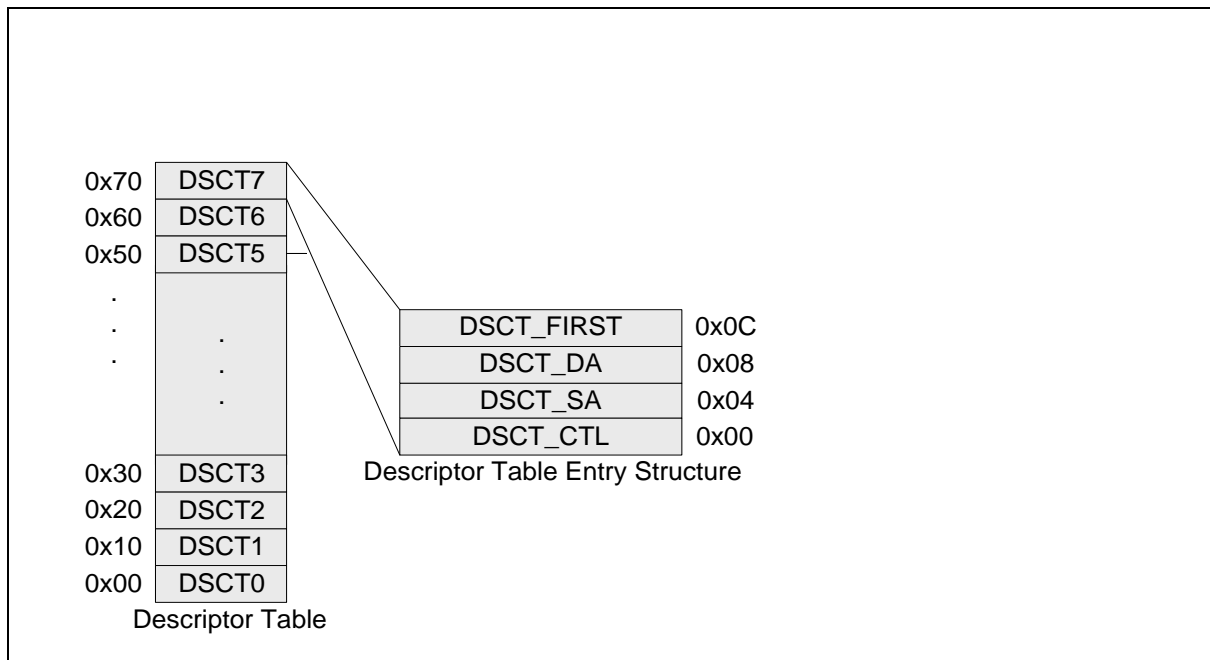

Figure 6.6-2 Descriptor Table Entry Structure

The PDMA controller also supports single and burst transfer type and the request source can be from software or peripheral request, transfer between memory to memory using software request. A single transfer means that software or peripheral is ready to transfer one data (every data needs one request), and the burst transfer means that software or peripherals will transfer multiple data (multiple data only need one request).

6.6.5.1 Channel Priority

The PDMA controller supports two level channel priorities including fixed and round-robin priority. The fixed priority channel has higher priority than round-robin priority channel. If multiple channels are set as fixed or round-robin priority, the higher channel will have higher priority. The priority order is listed in Table 6.6-1.

PDMA_PRISET	Channel Number	Priority Setting	Arbitration Priority In Descending Order
1	7	Channel7, Fixed Priority	Highest

1	6	Channel6, Fixed Priority	---
---	---	---	---
1	0	Channel0, Fixed Priority	---
0	7	Channel7, Round-Robin Priority	---
0	6	Channel6, Round-Robin Priority	---
---	---	---	---
0	0	Channel0, Round-Robin Priority	Lowest

Table 6.6-1 Channel Priority Table

6.6.5.2 PDMA Operation Mode

The PDMA controller supports two operation modes including Basic mode and Scatter-gather mode.

Basic Mode

Basic mode is used to perform one descriptor table transfer mode. This mode can be used to transfer data between memory and memory, peripherals and memory or peripherals and peripherals, but if user want to transfer data between peripherals and peripherals, one thing must be sured is that the request from peripherals knows that the data is ready for transfer or not. PDMA controller operation mode can be set from OPMODE (PDMA_DSCTn_CTL[1:0], n denotes PDMA channel), the default setting is in idle state (OPMODE (PDMA_DSCTn_CTL[1:0]) = 0x0) and recommend user configure the descriptor table in idle state. If operation mode is not in idle state, user re-configure channel setting may make some operation error.

User must fill the transfer count TXCNT (PDMA_DSCTn_CTL[31:16]) register and select transfer width TXWIDTH (PDMA_DSCTn_CTL[13:12]), destination address increment size DAINC (PDMA_DSCTn_CTL[11:10]), source address increment size SAINC (PDMA_DSCTn_CTL[9:8]), burst size BURSIZE (PDMA_DSCTn_CTL[6:4]) and transfer type TXTYPE (PDMA_DSCTn_CTL[2]), then the PDMA controller will perform transfer operation in transfer state after receiving request signal. Finishing this task will generate an interrupt to CPU if corresponding PDMA interrupt bit INTENn (PDMA_INTEN[7:0]) is enabled and the operation mode will be updated to idle state as shown in Figure 6.6-3. If software configures the operation mode to idle state, the PDMA controller will not perform any transfer and then clear this operation request. Finishing this task will also generate an interrupt to CPU if corresponding PDMA interrupt bit is enabled.

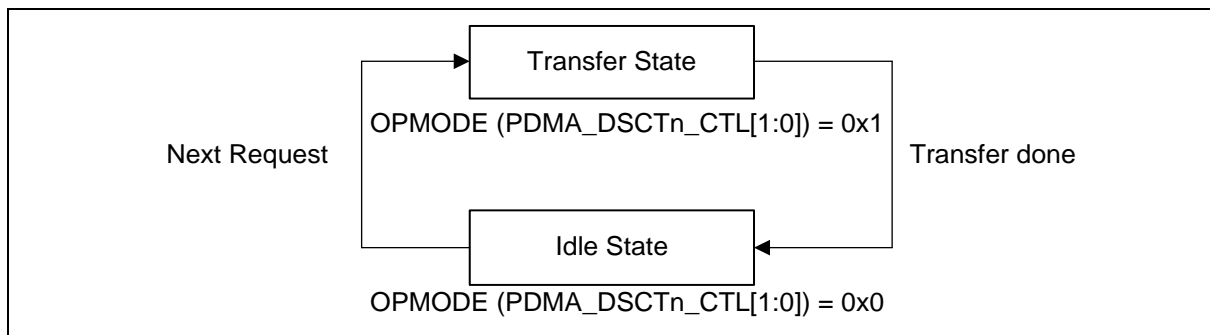

Figure 6.6-3 Basic Mode Finite State Machine

Scatter-gather Mode

Scatter-gather mode is a complex mode and can perform sophisticated transfer through the use of the description link list table as shown in Figure 6.6-4. Through operation mode user can perform peripheral wrapper-around, and multiple PDMA task can be used for data transfer between varied locations in system memory instead of a set of contiguous locations. Scatter-gather mode only needs a request to

finish all table entries task till the last task with OPMODE (PDMA_DSCTn_CTL[1:0]) is idle state without ack. It also means Scatter-gather mode can only be used to transfer data between memory to memory without handshaking.

In Scatter-gather mode, the table is just used for jumping to the next table entry. The first task will not perform any operation transfer. Finishing each task will generate an interrupt to CPU if corresponding PDMA interrupt bit is enabled and TBINTDIS (PDMA_DSCTn_CTL[7]) bit is "0" (when finishing task and TBINTDIS bit is "0", corresponding TDIFn (PDMA_TDSTS[7:0]) flag will be asserted and if this bit is "1" TDIFn will not be active).

If channel 7 has been triggered, and the operation mode is in Scatter-gather mode (OPMODE (PDMA_DSCTn_CTL[1:0]) = 0x2), the hardware will load the real PDMA information task from the address generated by adding PDMA_DSCTn_NEXT (link address) and PDMA_SCATBA (base address) registers. For example, base address is 0x2000_0000 (only MSB 16 bits valid in PDMA_SCATBA), the current link address is 0x0000_0100 (only LSB 16bits without last two bits [1:0] valid in PDMA_DSCTn_NEXT), and then the next DSCT entry start address is 0x2000_0100.

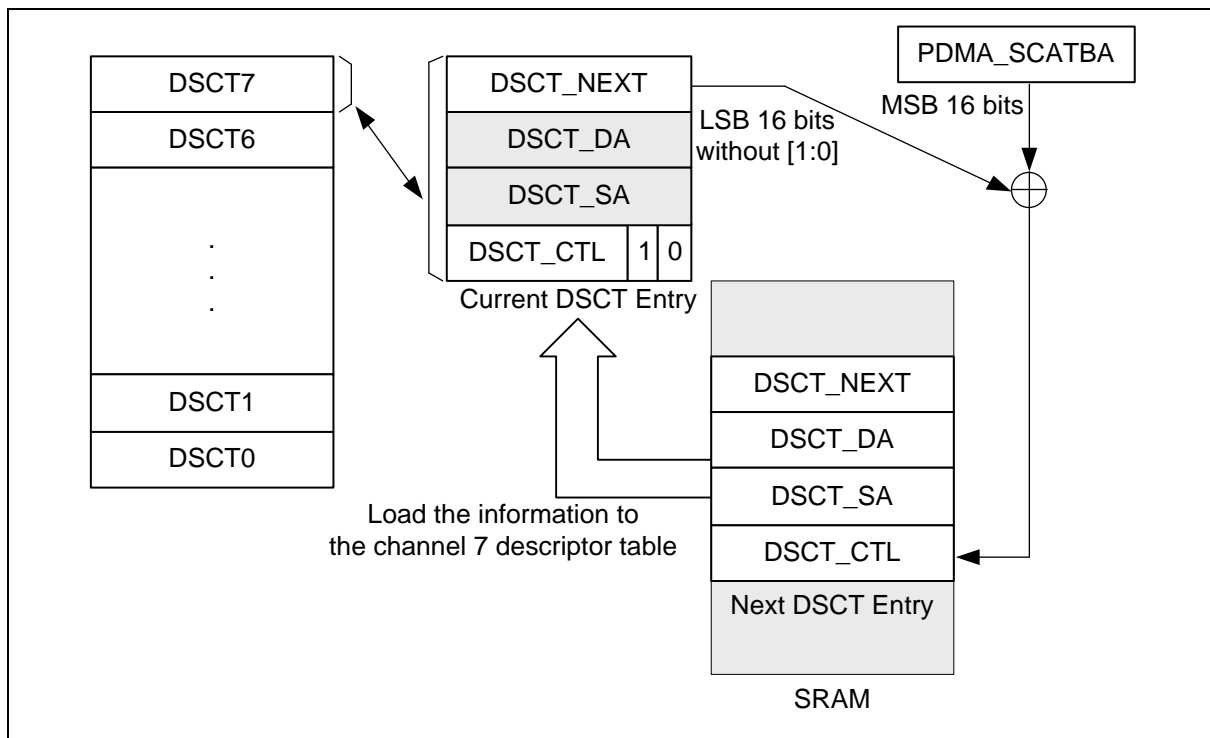

Figure 6.6-4 Descriptor Table Link List Structure

The above link list table operation is DSCT state in Scatter-gather Mode as shown in Figure 6.6-5. When loading the information is finished, it will go to transfer state and start transfer by this information automatically. However, if the next PDMA information is also set to Scatter-gather mode, the hardware will catch the next PDMA information block when the current task is finished. The Scatter-gather mode switches to basic mode when doing the next task. Then, the basic mode switches to Idle state when the last task is finished.

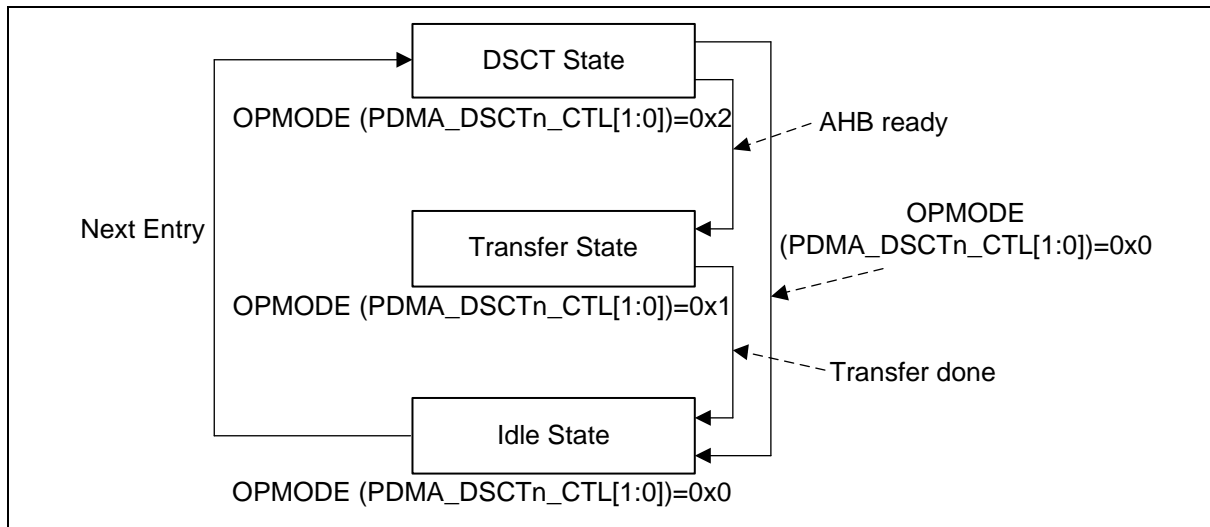

Figure 6.6-5 Scatter-gather Mode Finite State Machine

6.6.5.3 Transfer Type

The PDMA controller supports two transfer types: single transfer type and burst transfer type, configure by setting TXTYPE (PDMA_DSCTn_CTL[2]).

When the PDMA controller is operated in single transfer type, each transfer data needs one request signal for one transfer, after transferred data, TXCNT (PDMA_DSCTn_CTL[31:16]) will decrease 1. Transfer will be finished after the TXCNT (PDMA_DSCTn_CTL[31:16]) decreases to 0. In this mode, the BURSIZE (PDMA_DSCTn_CTL[6:4]) is not useful to control the transfer size. The BURSIZE (PDMA_DSCTn_CTL[6:4]) will be fixed as one.

For the burst transfer type, the PDMA controller transfers TXCNT (PDMA_DSCTn_CTL[31:16]) of data and need only one request signal. After transferred BURSIZE (PDMA_DSCTn_CTL[6:4]) of data, TXCNT (PDMA_DSCTn_CTL[31:16]) will decrease BURSIZE number. Transfer will be done after the transfer count TXCNT (PDMA_DSCTn_CTL[31:16]) decreases to 0. Note that burst transfer type can only be used for PDMA controller to do burst transfer between memory and memory. User must use single request type for memory-to-peripheral and peripheral-to-memory transfers.

Figure 6.6-6 shows an example about single and burst transfer type in basic mode. In this example, channel 1 uses single transfer type and TXCNT (PDMA_DSCTn_CTL[31:16]) = 127. Channel 0 uses burst transfer type, BURSIZE (PDMA_DSCTn_CTL[6:4]) = 128 and TXCNT (PDMA_DSCTn_CTL[31:16]) = 255. The operation sequence is described below:

1. Channel 0 and channel 1 get the trigger signal at the same time.
2. Channel 1 has higher priority than channel 0 by default; the PDMA controller will load the channel 1 descriptor table first and executing. But channel 1 is single transfer type, and thus the PDMA controller will only transfer one transfer data.
3. Then, the PDMA controller turns to the channel 0 and loads channel 0's descriptor table. The channel 0 is burst transfer type and the burst size selected to 128. Therefore, the PDMA controller will transfer 128 transfer data.
4. When channel 0 transfers 128 data, channel 1 gets another request signal, then after channel 0 finishes 128 transfer data, the PDMA controller will turn to channel 1 and transfer next one data.
5. After channel 1 transfers data, the PDMA controller switches to low priority channel 0 to continuous next 128 data transfer. If no channel 1 request receives, PDMA will start next channel 0, 128 data transfer.
6. The PDMA controller will complete transfer when channel 0 finishes data transfer 256 times, and channel 1 finishes transferring 128 times.

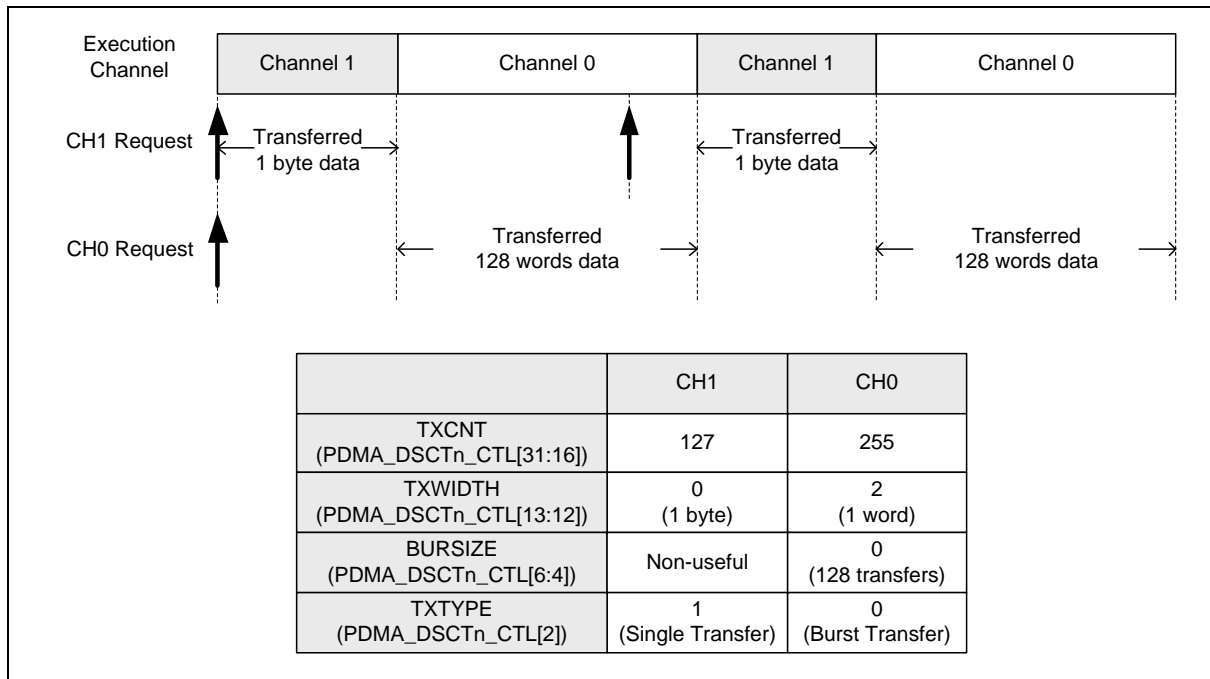

Figure 6.6-6 Example of Single Transfer Type and Burst Transfer Type in Basic Mode

6.6.5.4 Channel Time-out

Only PDMA channel 0 and channel 1 support time-out function. When the transfer channel is enabled and selected to the peripheral, corresponding channel time-out TOUTENn (PDMA_TOUTEN [n], n=0,1) is enabled, then channel's corresponding time-out counter will start count up from 0 while the channel has received trigger signal from the peripheral.

The time-out counter is based on output of HCLK prescaler, which is setting by corresponding channel's TOUTPSCn (PDMA_TOUTPSC [2+4n:4n], n=0,1). If time-out counter counts up from 0 to corresponding channel's TOCn (PDMA_TOC0_1 [16(n+1)-1:16n], n=0,1), the PDMA controller will generate interrupt signal when corresponding TOUTIENn (PDMA_TOUTIEN [n], n=0,1) is enabled. When time-out occurred, corresponding channel's REQTOFn (PDMA_INTSTS [n+8], n=0,1) will be set to indicate channel time-out is happened.

Time-out counter resets to 0 while counter count to TOCn (PDMA_TOC0_1 [16(n+1)-1:16n], n=0,1), received trigger signal, time-out function is disabled or chip enters Power-down mode.

Figure 6.6-7 shows an example about time-out counter operation. The operation sequence is described below:

1. The channel 0 time-out counter is not counting when time-out function is enabled by setting TOUTEN0(PDMA_TOUTEN[0]) bit to 1.
2. Time-out counter starts counting from 0 to the value of TOC0(PDMA_TOC0_1[15:0]) bits when receiving the first peripheral request.
3. Time-out counter is reset to 0 by received second peripheral request.
4. Channel 0 request time-out flag(REQTOF0(PDMA_INTSTS[8])) is set to high when time-out counter counts to 5. The counter will keep counting from 0 to 5, and user can clear REQTOF0 flag and then poll REQTOF0 flag to check the next time-out occurred.
5. Time-out counter is reset to 0 when time-out function is disabled.

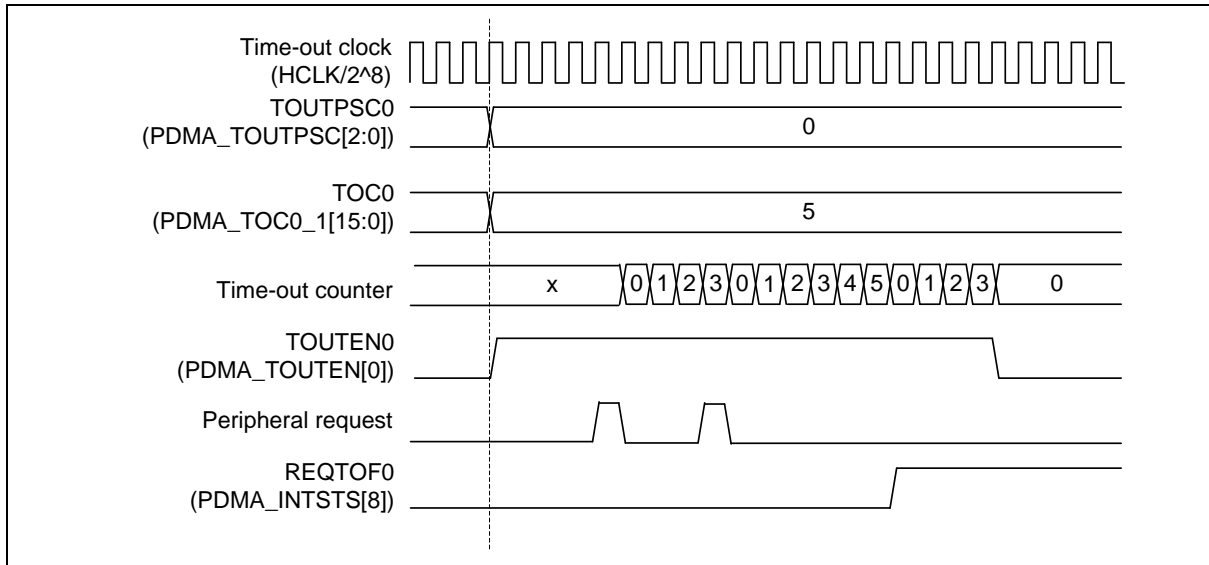

Figure 6.6-7 Example of PDMA Channel 0 Time-out Counter Operation

6.6.5.5 Stride Function

The PDMA supports channel 0 to channel 5 six channels with stride function. The stride function can transfer data from one address to another address and support block transfer with stride. When operating with stride function, the transfer address can be fixed or incremented successively.

Set STRIDEEN (PDMA_DSCTn_CTL[15]) to enable the stride function, and then write a valid source address to the PDMA_DSCTn_SA register and a source address offset count to SASOL (PDMA_ASOCRn[15:0]) register, a destination address to the PDMA_DSCTn_DA register and a destination address offset count to DASOL (PDMA_ASOCRn[31:16]), and a transfer count to the TXCNT (PDMA_DSCTn_CTL) register and a stride transfer count to STC (PDMA_STCn[15:0]). Next, trigger the SWREQn (PDMA_SWREQ[5:0]). The PDMA will start and then stop the transfer after TXCNT (PDMA_DSCTn_CTL) counts down to 0. Figure 6.6-8 shows the block transfer relationship between source memory and destination memory. The stride function also supports peripheral to memory or memory to peripheral transfer.

6.7 Timer Controller (TMR)

6.7.1 Overview

The timer controller includes four 32-bit timers, Timer0 ~ Timer3, allowing user to easily implement a timer control for applications. The timer can perform functions, such as frequency measurement, delay timing, clock generation, and event counting by external input pins, and interval measurement by external capture pins.

The timer controller also provides four PWM generators. Each PWM generator supports one PWM output and two selectable PWM output channels (TMx or TMx_EXT). The output state of PWM output pin can be control by polarity control, output enable control and output channel select.

6.7.2 Features

6.7.2.1 Timer Function Features

- Four sets of 32-bit timers, each timer having one 24-bit up counter and one 8-bit prescale counter
- Independent clock source for each timer
- Provides one-shot, periodic, toggle-output and continuous counting operation modes
- 24-bit up counter value is readable through CNT (TIMERx_CNT[23:0])
- Supports event counting function
- 24-bit capture value is readable through CAPDAT (TIMERx_CAP[23:0])
- Supports external capture pin (TMx_EXT) event for interval measurement
- Supports external capture pin (TMx_EXT) event to reset 24-bit up counter
- Supports internal clock (HIRC, LIRC, MIRC) and external clock (HXT, LXT) for capture event
- Supports chip wake-up from Idle/Power-down mode if a timer interrupt signal is generated
- Support Timer0 ~ Timer3 time-out interrupt signal or capture interrupt signal to trigger BPWM, PWM, EADC, DAC and PDMA function
- Supports internal capture triggered while internal ACMP output signal transition
- Supports Inter-Timer trigger mode
- Supports event counting source from internal USB SOF signal

6.7.2.2 PWM Function Features

- Supports PWM generator with two selectable output channels
- Supports 16-bit PWM counter
 - Up count operation type
 - One-shot or auto-reload counter operation mode
- Supports 8-bit prescale from 1 to 256
- Supports 16-bit compare register and period register and double buffer for period register and compare register
- Supports tri-state enable and polarity control for each PWM selectable output channels
- Supports interrupt on the following events:
 - PWM period point, up-count compared point events

- Supports wake-up when interrupt occurs when clock source is LXT or LIRC
- PWM can generator output in power down mode
- Supports trigger EADC, PDMA, and DAC on the following events:
 - PWM period point and up-count compared point events

6.7.3 Block Diagram

The timer controller block diagram and clock control are shown as follows.

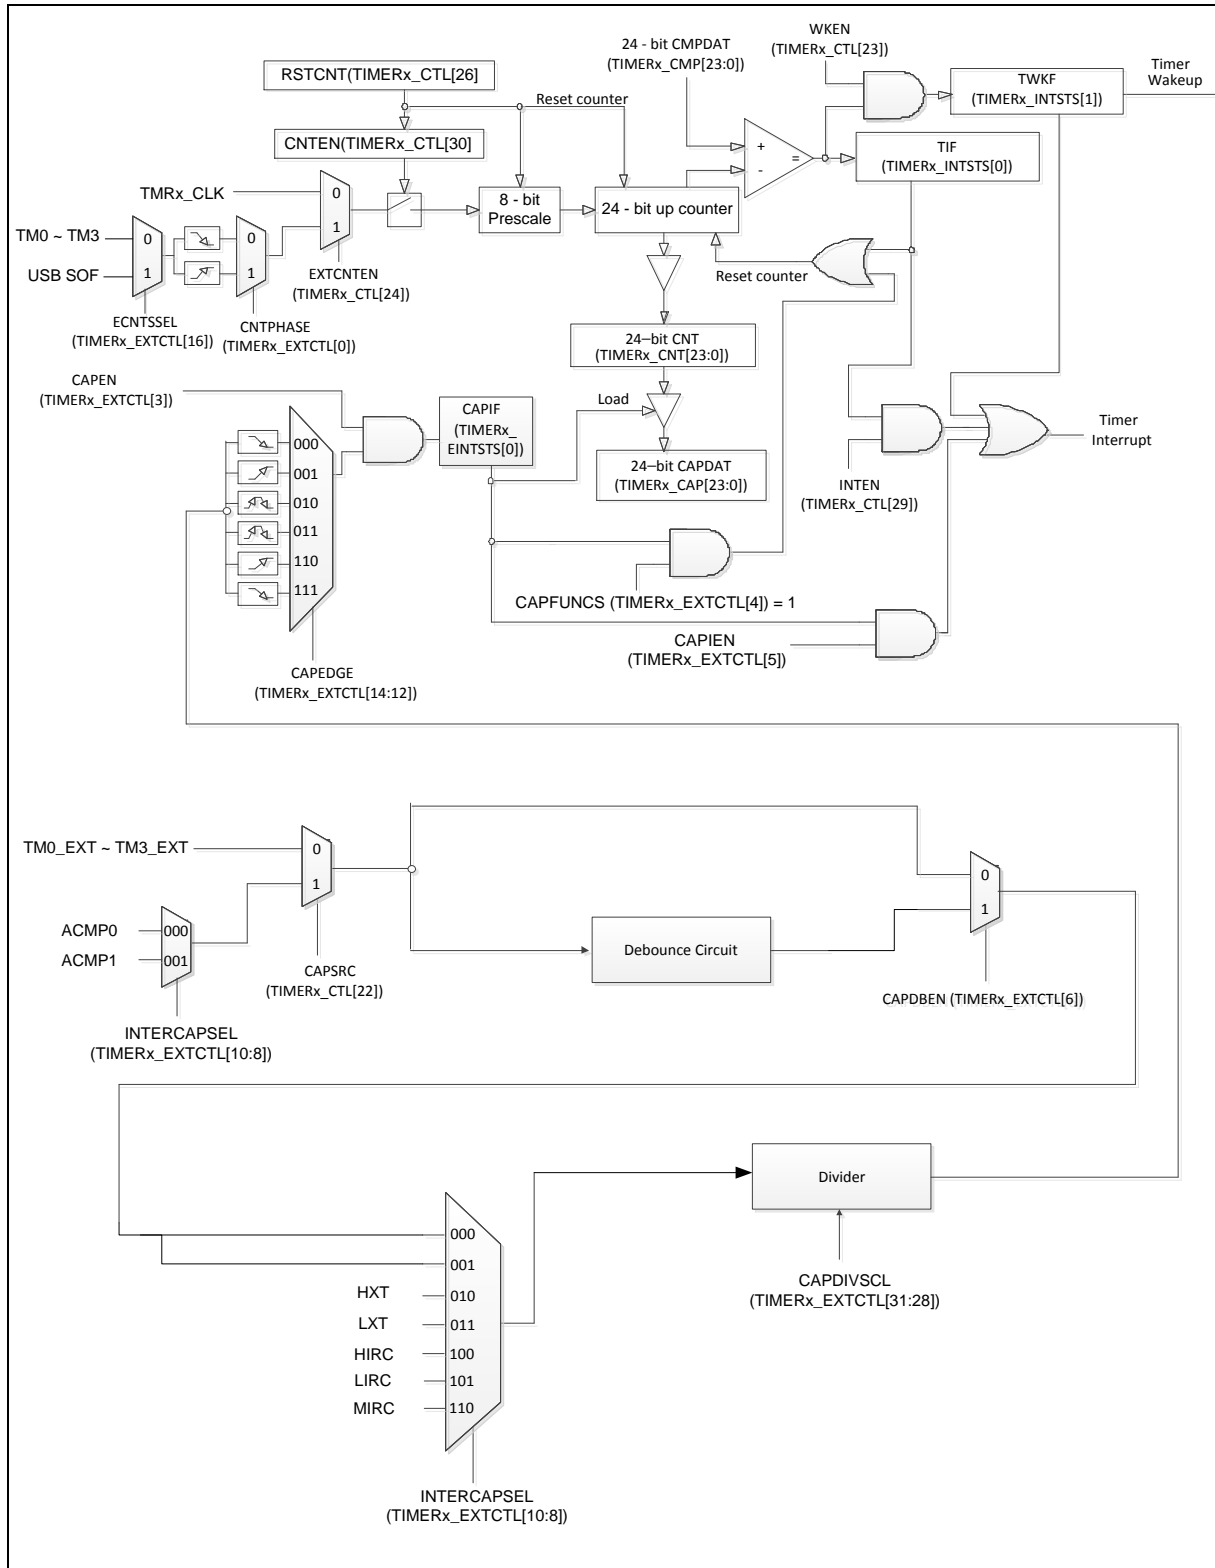

Figure 6.7-1 Timer Controller Block Diagram

Set FUNSEL (TIMERx_CTL[15]) 0 to enable timer mode. The clock source of Timer0 ~ Timer3 in timer mode can be enabled in TMRxCKEN (CLK_APBCLK0[5:2]) and selected as different frequency in TMR0SEL (CLK_CLKSEL1[10:8]) for Timer0, TMR1SEL (CLK_CLKSEL1[14:12]) for Timer1, TMR2SEL (CLK_CLKSEL1[18:16]) for Timer2 and TMR3SEL (CLK_CLKSEL1[22:20]) for Timer3 as Figure 6.7-2.

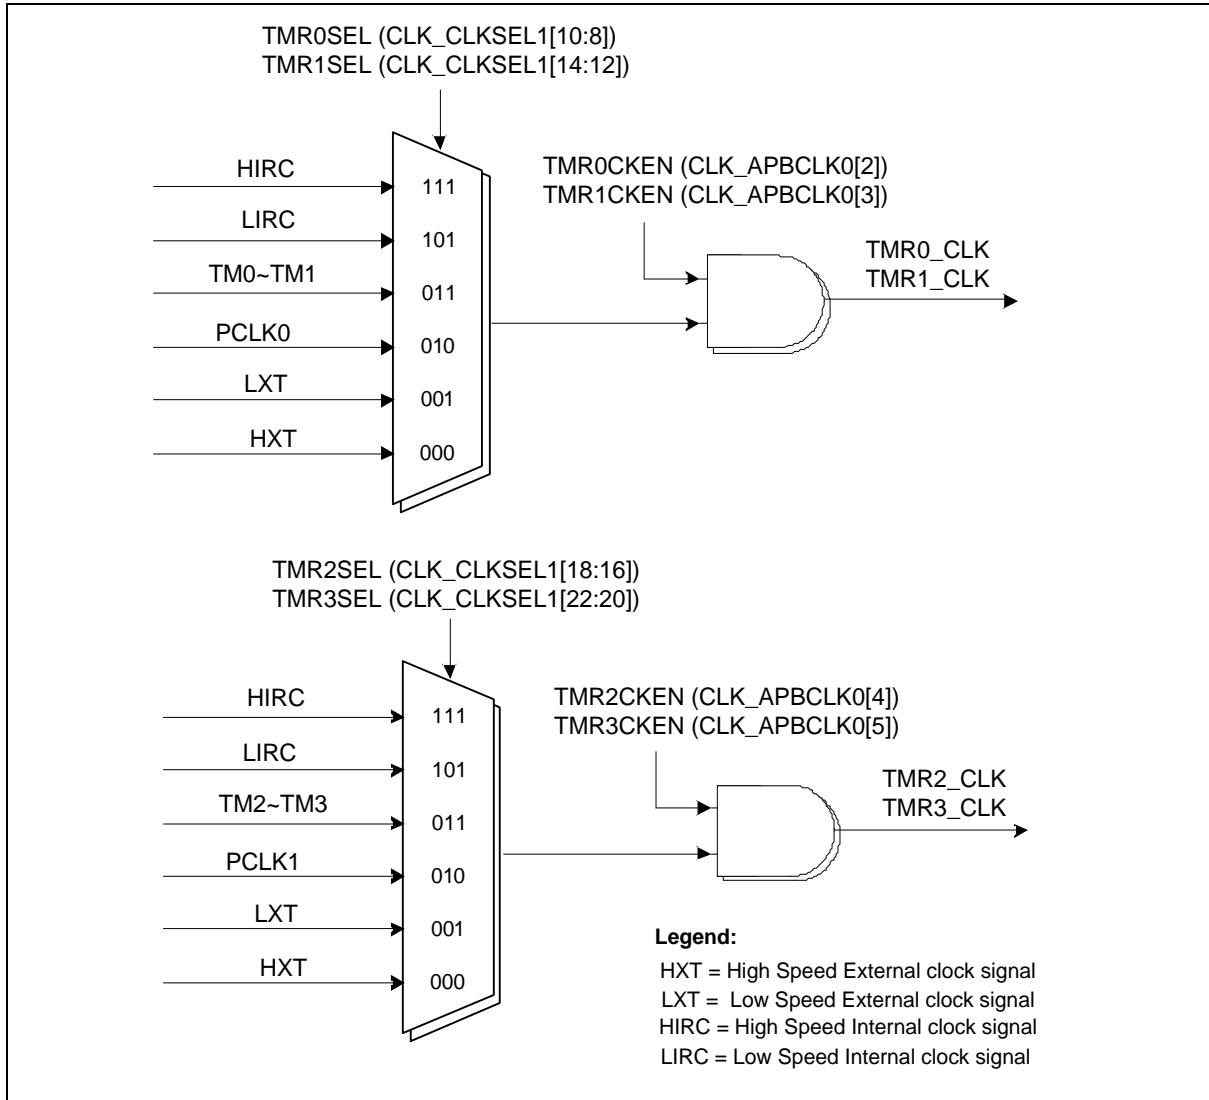

Figure 6.7-2 Clock Source of Timer Controller

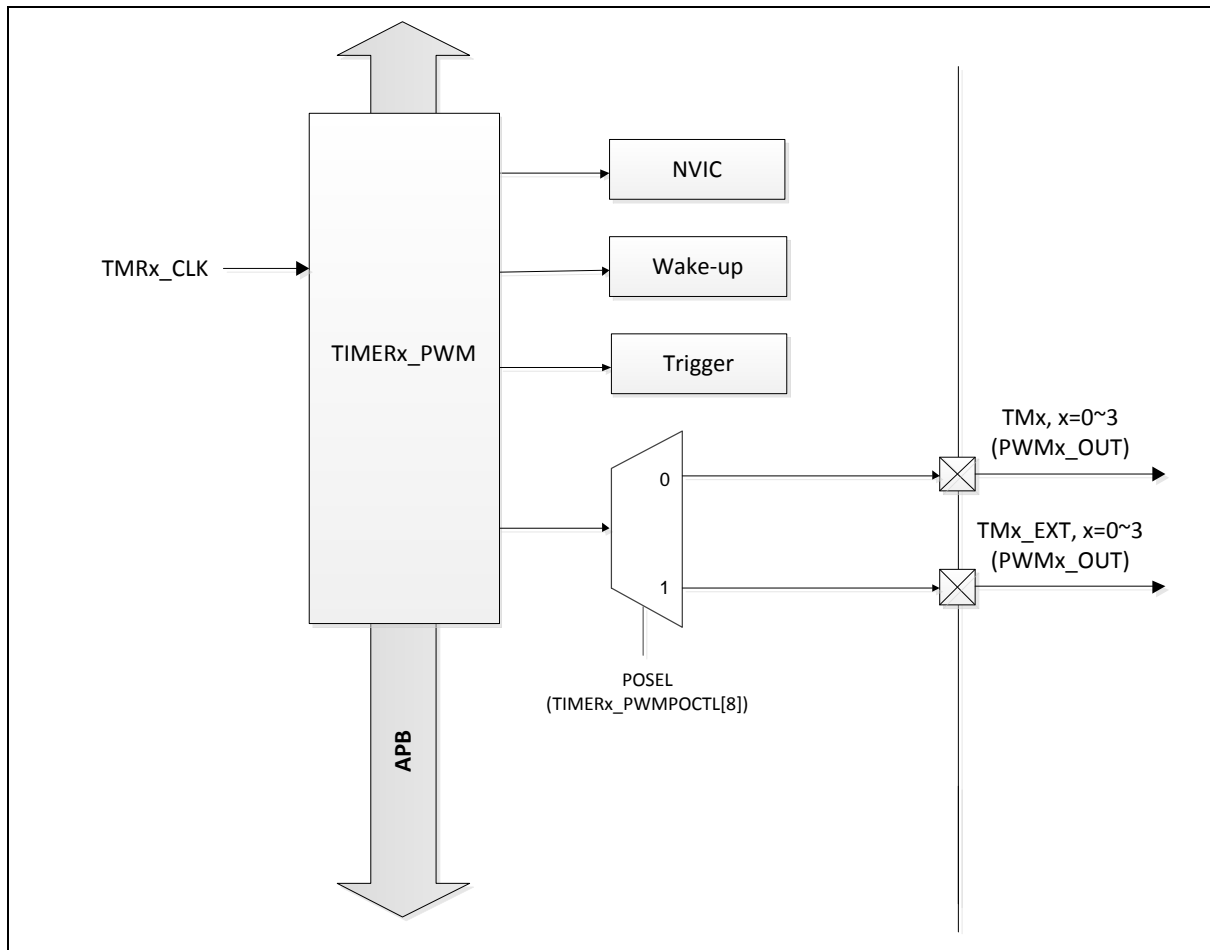

Figure 6.7-3 PWM Generator Overview Block Diagram

Set FUNSEL (TIMERx_CTL[15]) 1 to enable PWM mode. The clock source of Timer0 ~ Timer3 in PWM mode can be enabled in TMRxCKEN (CLK_APBCLK0[5:2]). PWM system clock and counter clock source are from TMRx_CLK.

Figure 6.7-4 illustrates the PWM architecture that supports one PWM output and two seletable TMx or TMx_EXT output channels in each PWM generator.

When PERIOD (TIMERx_PWMPERIOD[15:0]) is equal to CMP (TIMERx_PWMCMPDAT[15:0]), relative events will be generated. These events are passed to corresponding generators to generate PWM pulse (Pulse Generator), interrupt signal (Interrupt Generator), wake-up (Wake-up Generator) and trigger signal (Trigger Generator) for EADC, PDMA and DAC to start conversion. Output Control block is used to decide PWM pulse output.

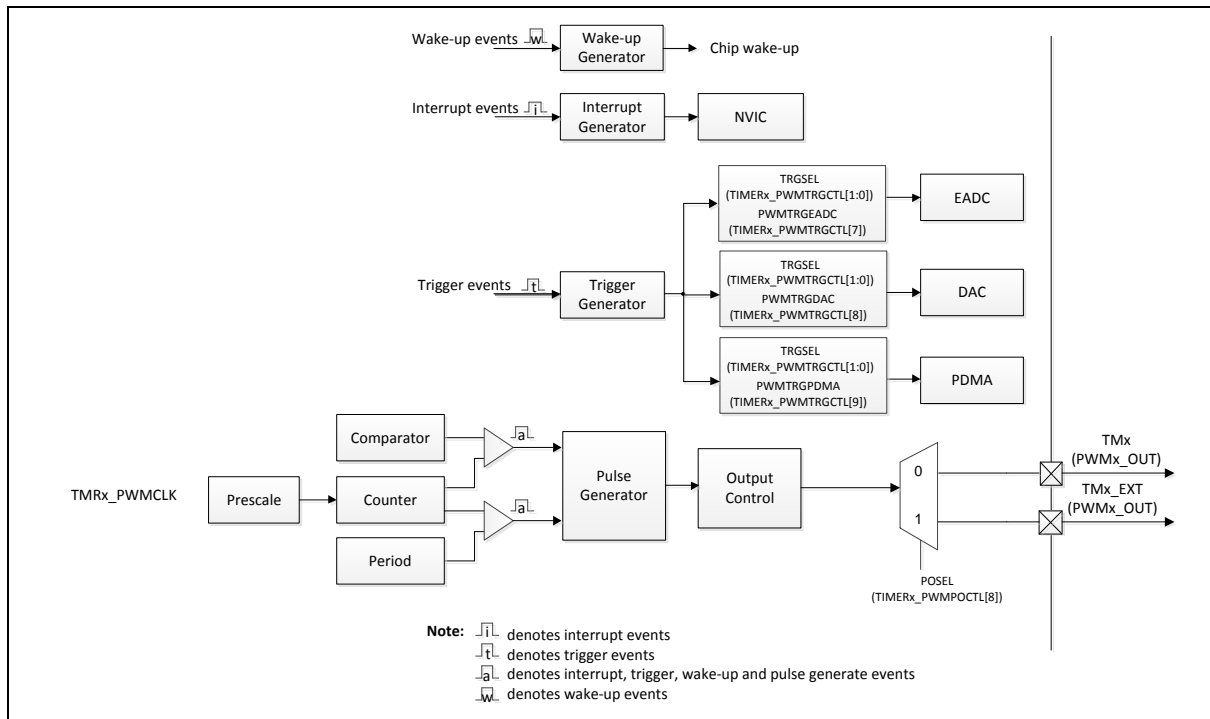

Figure 6.7-4 PWM Architecture Diagram

6.7.4 Basic Configuration

Set FUNSEL (TIMERx_CTL[15]) 0 to enable timer mode. The clock source of Timer0 ~ Timer3 in timer mode can be enabled in TMRxCKEN (CLK_APBCLK0[5:2]) and selected as different frequency in TMR0SEL (CLK_CLKSEL1[10:8]) for Timer0, TMR1SEL (CLK_CLKSEL1[14:12]) for Timer1, TMR2SEL (CLK_CLKSEL1[18:16]) for Timer2 and TMR3SEL (CLK_CLKSEL1[22:20]) for Timer3.

Set FUNSEL (TIMERx_CTL[15]) 1 to enable PWM mode. The clock source of Timer0 ~ Timer3 in PWM mode can be enabled in TMRxCKEN (CLK_APBCLK0[5:2]). PWM system clock and counter clock source are from TMRx_CLK.

6.7.4.1 TIMER01 basic configurations

- Clock source configuration
 - Enable TIMER0 peripheral clock in TMR0CKEN (CLK_APBCLK0[2]).
 - Enable TIMER1 peripheral clock in TMR1CKEN (CLK_APBCLK0[3]).
- Reset configuration
 - Reset TIMER0 controller in TMR0RST (SYS_IPRST1[2]).
 - Reset TIMER1 controller in TMR1RST (SYS_IPRST1[3]).
- Pin configuration

	TM3_EXT	PA.8, PB.12	MFP13

Table 6.7-3 TIMER23 Pin Configuration

6.7.5 **Timer Functional Description**

6.7.5.1 *Timer Interrupt Flag*

The timer controller supports the following interrupt flags; one is TIF (TIMERx_INTSTS[0]) and its set while timer counter value CNT (TIMERx_CNT[23:0]) matches the timer compared value CMPDAT (TIMERx_CMP[23:0]), and CAPIF (TIMERx_EINTSTS[0]) is set means when the transition on the TMx_EXT pin ,ACMP, internal clock (HIRC, LIRC, MIRC) or external clock (HXT, LXT) associated CAPEDGE (TIMERx_EXTCTL[14:12]) setting. The TWKF (TIMERx_INTSTS[1]) bit indicates the interrupt wake-up flag status of timer. User can set CAPSRC (TIMERx_CTL[22]) and INTERCAPSEL (TIMERx_EXTCTL[10:8]) to select capture source. Set WKEN (TIMERx_CTL[23]) to 1 can use wake-up function.

6.7.5.2 *Timer Counting Mode*

The timer controller provides four timer counting modes: one-shot, periodic, toggle-output and continuous counting operation modes:

One-shot Mode

If the timer controller is configured at one-shot mode (TIMERx_CTL[28:27] is 00) and CNTEN (TIMERx_CTL[30]) is set, the timer counter starts up counting. Once the CNT (TIMERx_CNT[23:0]) value reaches CMPDAT (TIMERx_CMP[23:0]) value, the TIF (TIMERx_INTSTS[0]) will be set to 1, CNT value and CNTEN bit is cleared automatically by timer controller then timer counting operation stops. In the meantime, if the INTEN (TIMERx_CTL[29]) is enabled, the timer interrupt signal is generated and sent to NVIC to inform CPU also.

User can monitor the RSTACT (TIMERx_CNT[31]) to ensure counter reset operation active and disable ICE debug mode acknowledgement effects TIMER counting by setting ICEDEBUG (TIMERx_CTL[31]) to 1.

Periodic Mode

If the timer controller is configured at periodic mode (TIMERx_CTL[28:27] is 01) and CNTEN (TIMERx_CTL[30]) is set, the timer counter starts up counting. Once the CNT (TIMERx_CNT[23:0]) value reaches CMPDAT (TIMERx_CMP[23:0]) value, the TIF (TIMERx_INTSTS[0]) will be set to 1, CNT value will be cleared automatically by timer controller and timer counter operates counting again. In the meantime, if the INTEN (TIMERx_CTL[29]) bit is enabled, the timer interrupt signal is generated and sent to NVIC to inform CPU also. In this mode, the timer controller operates counting and compares with CMPDAT value periodically until the CNTEN bit is cleared by user.

User can set PERIOSEL (TIMERx_CTL[20]) to select Timer behavior.

Toggle-Output Mode

If the timer controller is configured at toggle-output mode (TIMERx_CTL[28:27] is 10) and CNTEN (TIMERx_CTL[30]) is set, the timer counter starts up counting. The counting operation of toggle-output mode is almost the same as periodic mode, except toggle-output mode has associated TM0 ~ TM3 or TM0_EXT ~ TM3_EXT pin to output signal while specify TIF (TIMERx_INTSTS[0]) is set. User can set TGLPINSEL (TIMERx_CTL[21]) to choose TMx or TMx_EXT as toggle-output pin. Thus, the toggle-output signal on TM0 ~ TM3 pin is high and changing back and forth with 50% duty cycle.

Continuous Counting Mode

If the timer controller is configured at continuous counting mode (TIMERx_CTL[28:27] is 11) and CNTEN (TIMERx_CTL[30]) is set, the timer counter starts up counting. Once the CNT (TIMERx_CNT[23:0]) value reaches CMPDAT (TIMERx_CMP[23:0]) value, the TIF (TIMERx_INTSTS[0]) will be set to 1 and CNT value keeps up counting. In the meantime, if the INTEN (TIMERx_CTL[29]) is enabled, the timer interrupt signal is generated and sent to NVIC to inform CPU also. User can change different CMPDAT value immediately without disabling timer counting and restarting timer counting in this mode.

For example, CMPDAT value is set as 80, first. The TIF will set to 1 when CNT value is equal to 80, timer counter is kept counting and CNT value will not goes back to 0, it continues to count 81, 82, 83, ... to $(2^{24} - 1)$, 0, 1, 2, 3, ... to $(2^{24} - 1)$ again and again. Next, if user programs CMPDAT value as 200 and clears TIF, the TIF will set to 1 again when CNT value reaches to 200. At last, user programs CMPDAT as 500 and clears TIF, the TIF will set to 1 again when CNT value reaches to 500.

In this mode, the timer counting is continuous. So this operation mode is called as continuous counting mode.

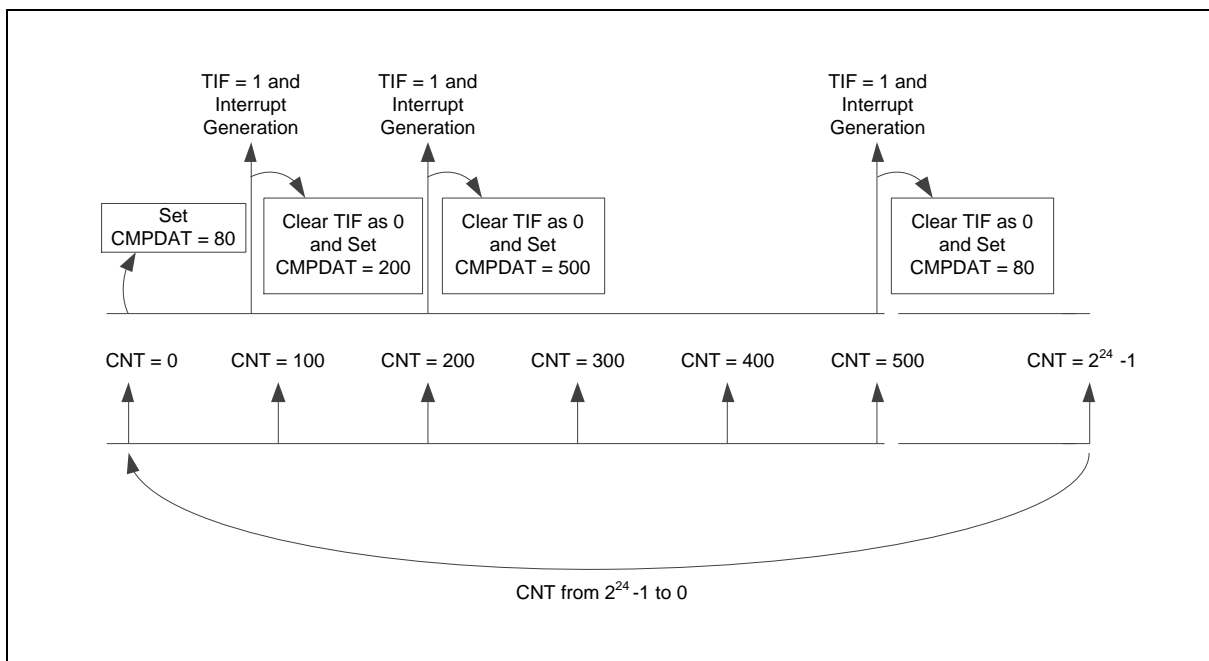

Figure 6.7-5 Continuous Counting Mode

6.7.5.3 Event Counting Mode

The timer controller also provides an application which can count the input event from TMx (x= 0~3) pin and the number of event will reflect to CNT (TIMERx_CNT[23:0]) value. It is also called as event counting function. In this function, EXTCNTEN (TIMERx_CTL[24]) should be set and the timer peripheral clock source should be set as PCLK.

If ECNTSSEL (TIMERx_EXTCTL[16]) is 0, the event counter source is from external TMx pin. User can enable or disable TMx pin de-bounce circuit by setting CNTDBEN (TIMERx_EXTCTL[7]). The input event frequency should be less than 1/3 PCLK if TMx pin de-bounce disabled or less than 1/8 PCLK if TMx pin de-bounce enabled to assure the returned CNT value is correct, and user can also select edge detection phase of TMx pin by setting CNTPHASE (TIMERx_EXTCTL[0]) bit.

In event counting mode, the timer counting operation mode can be selected as one-shot, periodic and continuous counting mode to counts the counter value CNT (TIMERx_CNT[23:0]) for TMx. .

If ECNTSSEL (TIMERx_EXTCTL[16]) is 1, the event counter source will generate by USB device detect the start-of-frame (SOF) packet. Please refer USB device specifications.

6.7.5.4 Capture Mode

The event capture function is used to load CNT (TIMERx_CNT[23:0]) value to CAPDAT (TIMERx_CAP[23:0]) value while edge transition detected on TMx_EXT (x= 0~3) pin, ACMP, internal clock and external clock. In this mode, CAPFUNCS (TIMERx_EXTCTL[4]) should be as 0 to trigger event capture function and the timer peripheral clock source should be set as PCLK.

If CAPSRC (TIMERx_CTL[22]) is 0, the capture event is triggered by TMx_EXT pin transition. User can enable or disable TMx_EXT pin de-bounce circuit by setting CAPDBEN (TIMERx_EXTCTL[6]). The transition frequency of TMx_EXT pin should be less than 1/3 PCLK if TMx_EXT pin de-bounce disabled or less than 1/8 PCLK if TMx_EXT pin de-bounce enabled to assure the capture function can be work normally, and user can also select edge transition detection of TMx_EXT pin by setting CAPEDGE (TIMERx_EXTCTL[14:12]).

In event capture mode, user does not consider what timer counting operation mode is selected, the capture event occurred only if edge transition on TMx_EXT pin is detected.

User can enable CAPIEN (TIMERx_EXTCTL[5]) to use capture interrupt fuction. When the TMx_EXT edge transition meets setting, CAPIF is high.

User must consider the Timer will keep register TIMERx_CAP unchanged and drop the new capture value, if the CPU does not clear the CAPIF status.

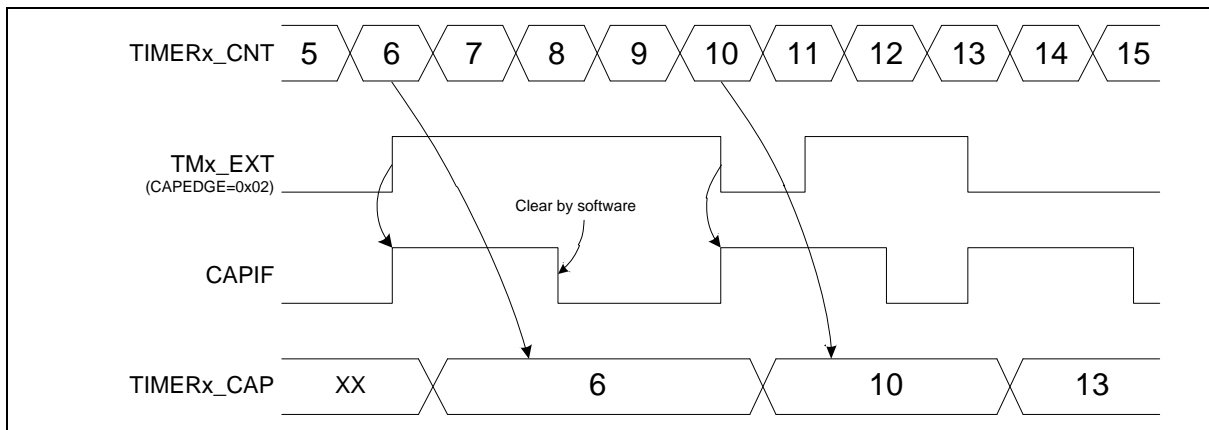

Figure 6.7-6 External Capture Mode

If CAPSRC (TIMERx_CTL[22]) is 1, set INTERCAPSEL (TIMERx_EXTCTL[10:8]) to choose different

capture source. The capture event can be triggered by internal output signal transition on ACMP0 if INTERCAPSEL (TIMERx_EXTCTL[10:8]) is 000, or ACMP1 if INTERCAPSEL is 001 ; Other capture sources are HXT, LXT, MIRC, LIRC, HIRC if INTERCAPSEL is 010, 011, 110, 101, 100 respectively. User can switch capture source only when original source and target source is all off. For example, if user wants to switch LXT or LIRC, both of capture source should be set off first.

The capture source can be divided by capture divider. Use can set CAPDIVSCL (TIMERx_EXTCTL[31:28]) to select different divider number. Be aware that timer clock frequency must be four times than capture source at least.

6.7.5.5 Reset Counter Mode

The timer controller also provides reset counter function to reset CNT (TIMERx_CNT[23:0]) value while capture event is generated. In this mode, CAPFUNCS (TIMERx_EXTCTL[4]) should be 1. User must set CAPSRC and INTERCAPSEL to select TMx_EXT transition, internal ACMPx output signal and internal clock or external clock to trigger reset counter value.

Figure 6.7-7 Reset Counter Mode

6.7.5.6 Timer Trigger Function

The timer controller provides timer time-out interrupt or capture interrupt to trigger PWM, BPWM, EADC, DAC and PDMA. If TRGSSEL (TIMERx_TRGCTL[0]) is 0, time-out interrupt signal is used to trigger PWM, BPWM, EADC, DAC and PDMA. If TRGSSEL (TIMERx_TRGCTL[0]) is 1, capture interrupt signal is used to trigger PWM, BPWM, EADC, DAC and PDMA.

When the TRGPWM (TIMERx_TRGCTL[1]) is set, if the timer interrupt signal is generated, the timer controller will generate a trigger pulse as PWM/BPWM external clock source.

When the TRGEADC (TIMERx_TRGCTL[2]) is set, if the timer interrupt signal is generated, the timer controller will trigger EADC to start converter.

When the TRGDAC (TIMERx_TRGCTL[3]) is set, if the timer interrupt signal is generated, the timer controller will trigger DAC to start converter.

When the TRGPDMA (TIMERx_TRGCTL[4]) is set, if the timer interrupt signal is generated, the timer controller will trigger PDMA.

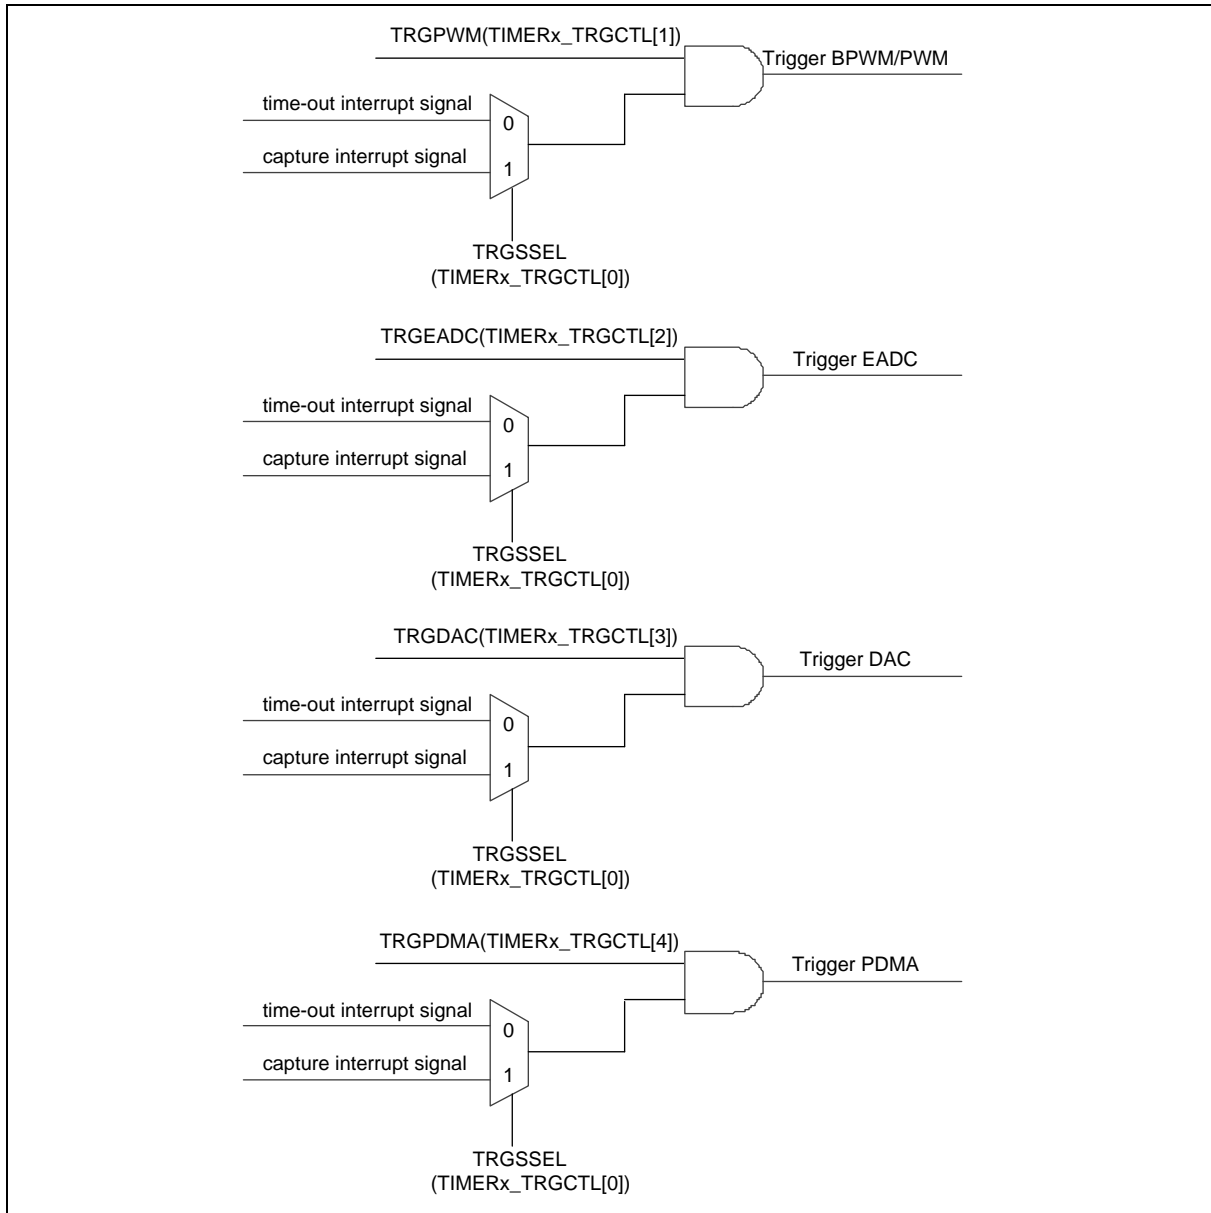

Figure 6.7-8 Internal Timer Trigger

When both the TRGPDMA (TIMERx_TRGCTL[4]) and TRGSSEL (TIMERx_TRGCTL[0]) are 1, TIMERx_CAP will change when encountering timer capture edge no matter whether CPU clear CAPIF status or not. In Trigger EADC DAC or PWM function, user must consider that the Timer will keep register TIMERx_CAP unchanged if the CPU does not clear the CAPIF status.

Figure 6.7-9 Capture interrupt trigger PDMA

6.7.5.7 Inter-Timer Trigger Capture Mode

In this mode, the Timer0/2 will be forced in event counting mode, counting with external event, and will generate an internal signal (INTR_TMR_TRG) to trigger Timer1/3 start or stop counting. Also, the Timer1/3 will be forced in capture mode and start/stop trigger-counting by Timer0/2 counter status.

Setting Timer0 Inter-timer Trigger Capture enabled, trigger-counting capture function is forced on Timer1. Setting Timer2 Inter-Timer Trigger Capture enabled, trigger-counting capture function is forced on Timer3.

Start Trigger

While INTRGEN (TIMERx_CTL[19]) in Timer0/2 is set, the Timer0/2 will make a rising-edge transition of INTR_TMR_TRG while Timer0/2 24-bit counter value (CNT) is counting from 0x0 to 0x1 and Timer1/3 counter will start counting immediately and automatically.

Stop Trigger

When Timer0/2 CNT reaches the Timer0/2 CMPDAT(TIMERx_CMP[23:0]) value, the Timer0/2 will make a falling-edge transition of INTR_TMR_TRG. Then Timer0/2 counter mode function will be disabled and INTRGEN (TIMERx_CTL[19]) will be cleared by hardware then Timer1/3 will stop counting also. At the same time, the Timer1/3 CNT value will be saved into Timer1/3 CAPDAT (TIMERx_CAP[23:0]).

User can use inter-timer trigger mode to measure the period of external event (TMx) more precisely. Figure 6.7-10 shows the sample flow of Inter-Timer Trigger Capture Mode for Timer0 as event counting mode and Timer1 as trigger-counting capture mode.

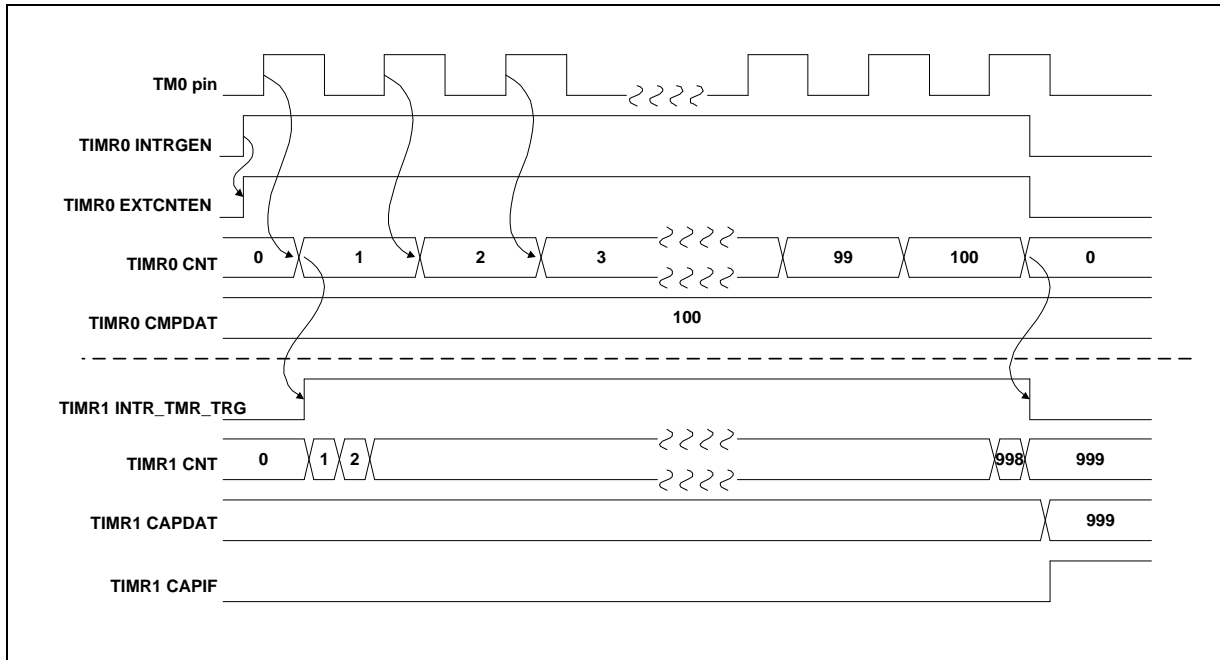

Figure 6.7-10 Inter-Timer Trigger Capture Timing

User must clear Timer1/3 CAPIF if user wants to use second inter-timer trigger function again.

6.7.6 PWM Functional Description

6.7.6.1 PWM Block Diagram

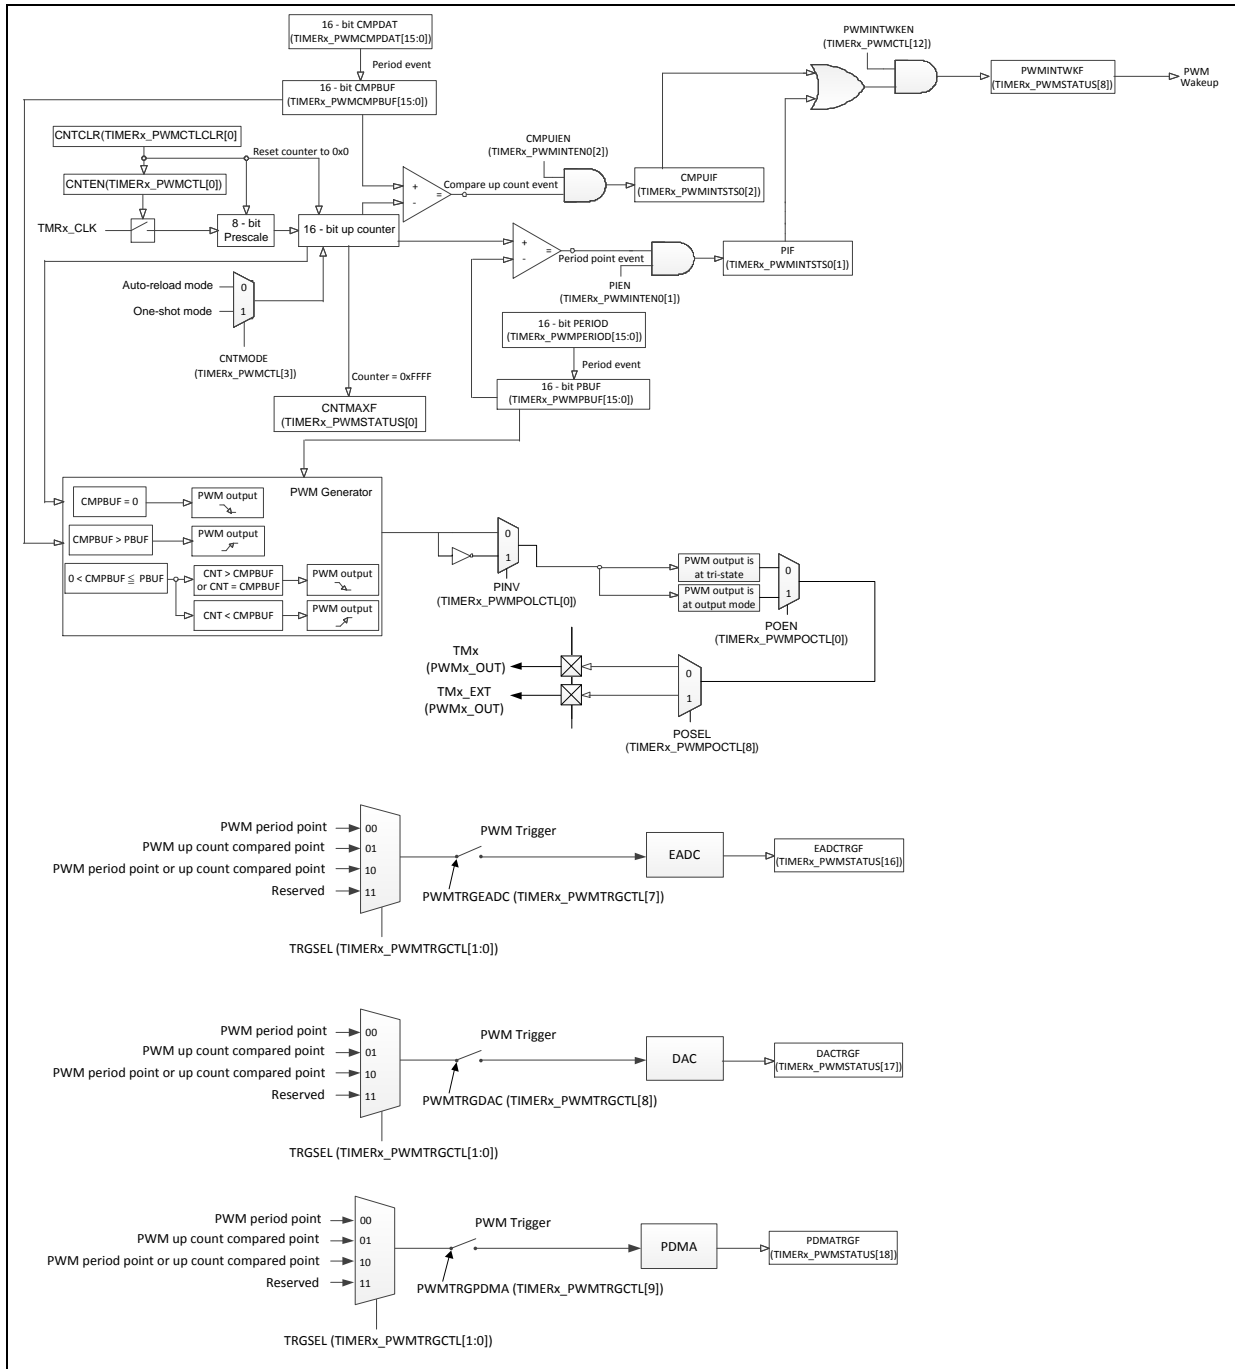

Figure 6.7-11 Timer PWM Block Diagram

6.7.6.2 PWM Prescale

The PWM prescale is used to divide clock source, and the clock of PWM counter is divided by (CLKPSC+ 1). The prescale is set by CLKPSC (TIMERx_PWMCLKPSC[7:0]). Figure 6.7-12 shows an example of PWM prescale waveform in up count type.

Figure 6.7-12 PWM Prescale Waveform in Up Count Type

6.7.6.3 PWM Counter

The PWM supports up count type

It starts up-counting from 0 to PERIOD (TIMERx_PWMPERIOD[15:0]). The current counter value can be read from the CNT (TIMERx_PWMCNT[15:0]). PWM generates a period point event when the counter counts to PERIOD and prescale counts to 0. Figure 6.7-13 shows an example of PWM up count type, where PWM period time is $(PERIOD+1) * (CLKPSC+1) * TMRx_PWMCLK$.

Figure 6.7-13 PWM Up Count Type

6.7.6.4 PWM Counter Operation mode

The PWM counter supports two operation modes: one-shot mode and auto-reload mode. PWM counter will operate in one-shot mode if CNTMODE (TIMERx_PWMCTL[3]) bit is set to 1, and operate in auto-reload mode if CNTMODE bit is set to 0.

In both modes, CMP (TIMERx_PWMCMPDAT[15:0]) and PERIOD (TIMERx_PWMPERIOD[15:0]) should be written first and then set CNTEN (TIMERx_PWMCTL[0]) bit to 1 to start counter running.

In one-shot mode, PWM counter value will reload to 0 after one PWM period is completed. User can write CMP to continuous one-shot operation to generate next one-shot pulse once no matter current one-shot counter is running or completed.

For example, user writes 0x10 to CMP, writes 0x3F to PERIOD and set CMPUIEN (TIMERx_PWMINTEN0[2]) and PIEN (TIMERx_PWMINTEN0[1]) to 1. When counter (CNT) counts to 0x10, CMPUIF (TIMERx_PWMINTSTS0[2]) is set to 1. Counter keeps counting until 0x3F, PIF (TIMERx_PWMINTSTS0[1]) is set to 1 then counter reload to 0, and counter stops counting.

Another example is user writes 0x10 to CMP, writes 0x3F to PERIOD and set CMPUIEN and PIEN to 1. If user writes 0x25 to CMP when counter counting, this value will load to CMPBUF (TIMERx_PWMCMPBUF[15:0]) when counter counts to 0x3F and PIF is set to 1, then counter counts

from 0. If user clears CMPUIF and PIF before counter counts to 0x25, CMPUIF and PIF will be set to 1 when counter counts to 0x25 and 0x3F, respectively.

In auto-reload mode, PWM counter is continuous running with current active PERIOD and CMP. If user sets PERIOD to zero in auto-reload mode, PWM counter value will reload to 0 after one PWM period is completed.

For example, user writes 0x10 to CMP, writes 0x3F to PERIOD. CMPUIEN and PIEN are set to 1. When counter counts to 0x10, CMPUIF is set to 1. Counter keeps counting until 0x3F, PIF is set to 1, and counter will restart counting from 0. If user clear CMPUIF and PIF before counter counts to 0x10 (2nd counts), CMPUIF will equal to 1 and PIF will equal to 1 when counter counts to 0x10 and 0x3F, respectively.

When user writes 0 to PERIOD and this value will be loaded to PBUF (TIMERx_PWMPBUF[15:0]). This action will make counter be set to 0 and stops counting until user rewrites another value (except 0) to PERIOD and this value loads to PBUF, counter counts from 0.

The one-shot and auto-reload mode comparison is shown as Table 6.7-4.

Counter Mode Functions	One-Shot	Auto-Reload
CNTMODE (TIMERx_PWMCTL[3])	1	0
CNT = PERIOD (PERIOD is not 0)	Stops counting	Keeps counting from 0 to PERIOD (Periodic)
PERIOD = 0 and loads to PBUF, then write another value (Except 0) to PERIOD	CNT stops counting even though user writes new PERIOD	CNT = 0 (reset value), CNT stops counting until PERIOD and PBUF is not equal to 0

Table 6.7-4 One-shot and Auto-reload Functions

Note: PERIOD (TIMERx_PWMPERIOD[15:0]) and CMP (TIMERx_PWMCMPDAT[15:0]) will load to PBUF (TIMERx_PWMPBUF[15:0]) and CMPBUF (TIMERx_PWMCMPBUF[15:0]), respectively, when one PWM period completes. The first CMP and PERIOD will load to CMPBUF and PBUF, respectively, after CNTEN (TIMERx_PWMCTL[0]) is 1.

6.7.6.5 PWM Comparator

The CMP (TIMERx_PWMCMPDAT[15:0]) is comparator register of PWM. The CMP value is continuously compared to the corresponding counter value. When the counter is equal to CMP, PWM generates a compared point event. This event will generate PWM output pulse, interrupt signal wake-up or trigger EADC, PDMA, DAC to start conversion.

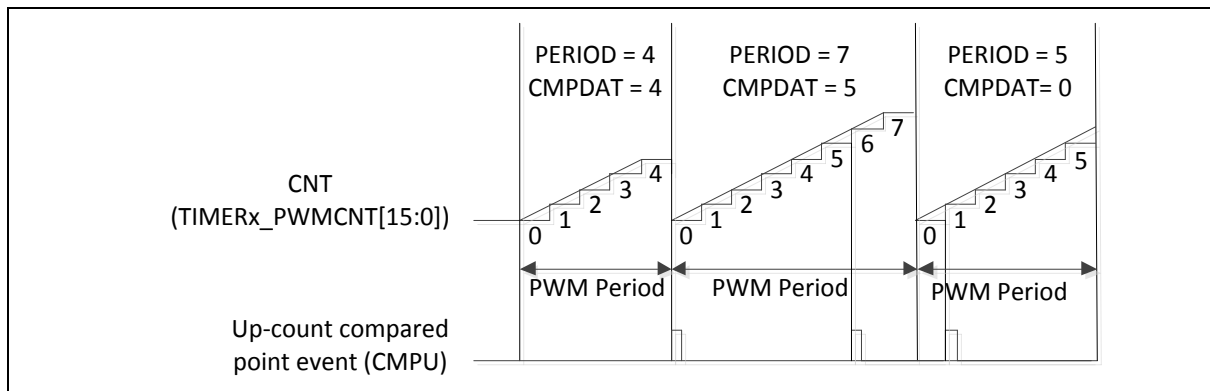

Figure 6.7-14 PWM Comparator Events in Up Count Type

6.7.6.6 Period Loading Mode

The PWM provides PBUF (TIMERx_PWMPBUF[15:0]) is the active PERIOD buffer register and CMPBUF (TIMERx_PWMCMPBUF[15:0]) is the active CMP buffer register. In period loading mode, both PERIOD (TIMERx_PWMPERIOD[15:0]) and CMP (TIMERx_PWMCMPDAT[15:0]) will load to their active PBUF and CMPBU register while each PWM period is completed. Figure 6.7-15 shows period loading timing of up count type, where PERIOD DATA0 denotes the initial data of PERIOD, PERIOD DATA1 denotes the first updated PERIOD data by user and so on, CMP also follows this rule. The following steps are the sequence of Figure 6.7-15.

1. User writes CMP DATA1 to CMP at point 1.
2. Period loading CMP DATA1 to CMPBUF at the end of PWM period at point 2.
3. User writes PERIOD DATA1 to PERIOD at point 3.
4. Period loading PERIOD DATA1 to PBUF at the end of PWM period at point 4.
5. User writes PERIOD DATA2 to PERIOD at point 5.
6. Period loading PERIOD DATA2 to PBUF at the end of PWM period at point 6.

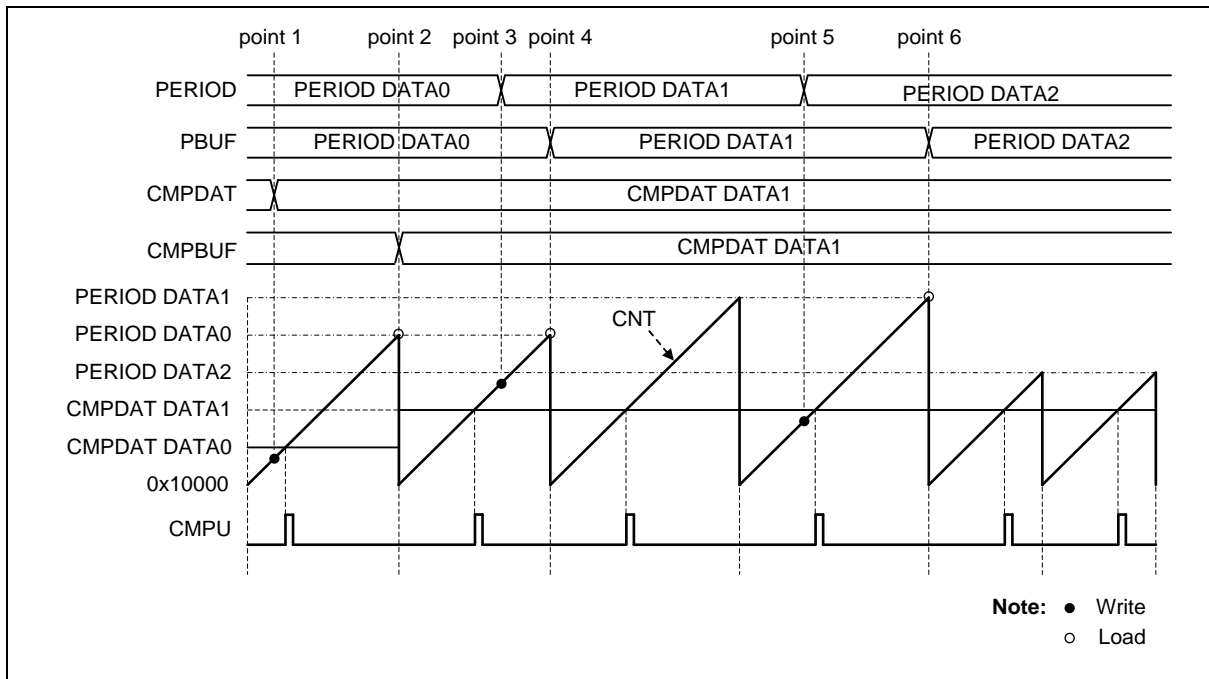

Figure 6.7-15 Period Loading Mode with Up Count Type

6.7.6.7 PWM Pulse Generator

PWM pulse generator uses counter and comparator events to generate PWM output pulse. The events are zero point in up count type and counter equal to comparator point in up count type.

The event point can generate PWM output waveform in up count type as shown in Figure 6.7-16

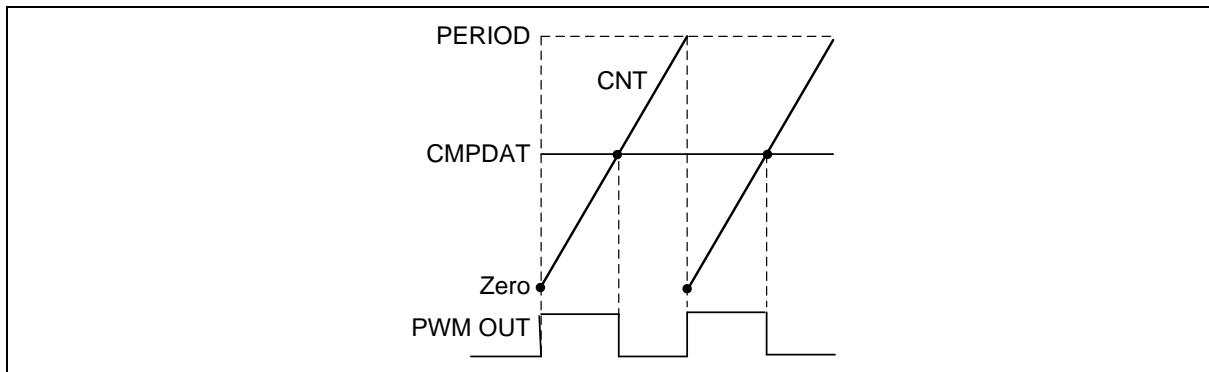

Figure 6.7-16 PWM Pulse Generation in Up Count Type

The PWM output pulse is associated with CMPBUF (TIMERx_PWMCMPBUF[15:0]) and PBUF (TIMERx_PWMPBUF[15:0]). The rules are listed as below.

1. If CMPBUF is zero, PWM output is 100% low.
2. If $CMPBUF > PBUF$, PWM output is 100% high.
3. If $0 < CMPBUF \leq PBUF$, PWM output high/low duty is according to counter value (TIMERx_PWMCNT[15:0]).
 - 1) If PWM counter is higher than CMPBUF or equal to CMPBUF, PWM output is low.
 - 2) If PWM counter is lower than CMPBUF, PWM output is high.

The PWM output level table is shown as Table 6.7-5.

Conditions	CMPBUF = 0	CMPBUF > PBUF	0 < CMPBUF ≤ PBUF	
			CNT ≥ CMPBUF	CNT < CMPBUF
PWM Output	Low	High	Low	High

Table 6.7-5 PWM Output Level

Figure 6.7-17 is an example about PWM duty cycle from 0% to 100% in up count type where PERIOD is 4 with different CMP value.

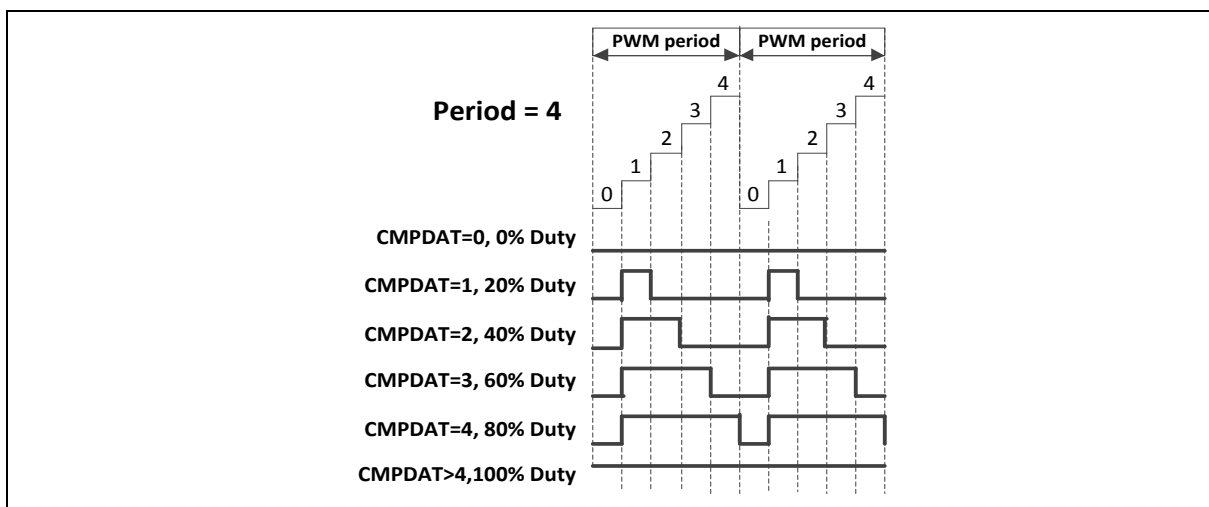

Figure 6.7-17 PWM 0% to 100% Duty Cycle in Up Count Type

6.7.6.8 PWM Output Control

After PWM pulse generator, there are three steps to control output waveform. User can set POEN (TIMERx_PWMPOCTL[0]) 1 to enable PWMx_OUT output waveform and set POSEL (TIMERx_PWMPOCTL[8]) to select TMx or TMx_EXT as PWM output channel.

There are polarity control, output enable control and output channel select to control output waveform as shown in Figure 6.7-18.

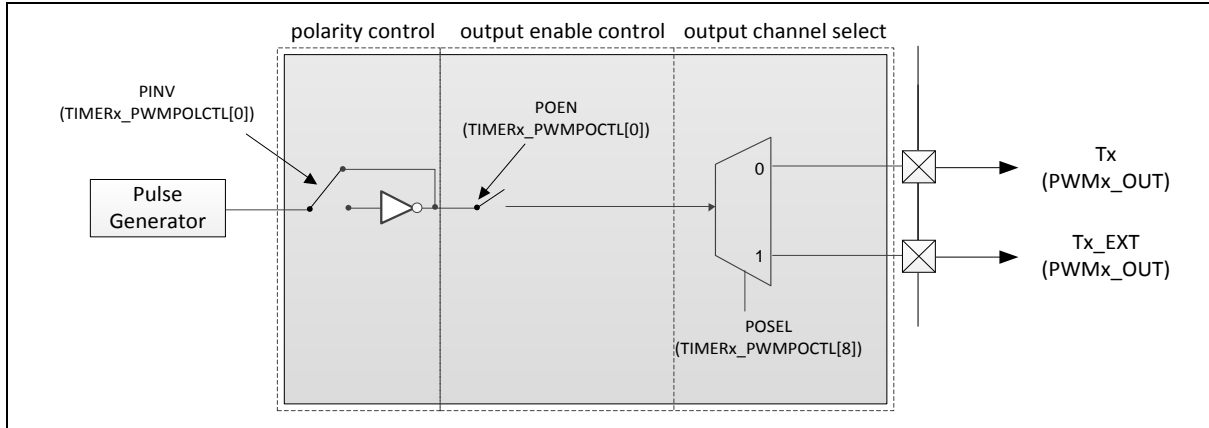

Figure 6.7-18 PWM Output PWMx_OUT Control

6.7.6.9 Polarity Control

Each PWMx_OUT (TMx or TMx_EXT) has an independent polarity control to configure the polarity of the active state of PWM output. User can control polarity state on PINV (TIMERx_PWMPOCTL[0]). Figure shows the PWMx_OUT with polarity control.

When PWM output is selected as TMx pin, PINV is 0, TMx_EXT pin is kept as 0. Similarly, TMx_EXT pin is kept as 1 when PINV is 1.

When PWM output is selected as TMx_EXT pin, PINV is 0, TMx pin is kept as 0. Similarly, TMx pin is kept as 1 when PINV is 1.

When PWM output is selected as TMx pin, PINV is 0, but POEN (TIMERx_PWMPOCTL[0]) is set as 0, TMx pin is kept as 0. Similarly, TMx pin is kept as 1 when PINV is 1.

When PWM output is selected as TMx_EXT pin, PINV is 0, but POEN is set as 0, TMx_EXT pin is kept as 0. Similarly, TMx_EXT pin is kept as 1 when PINV is 1.

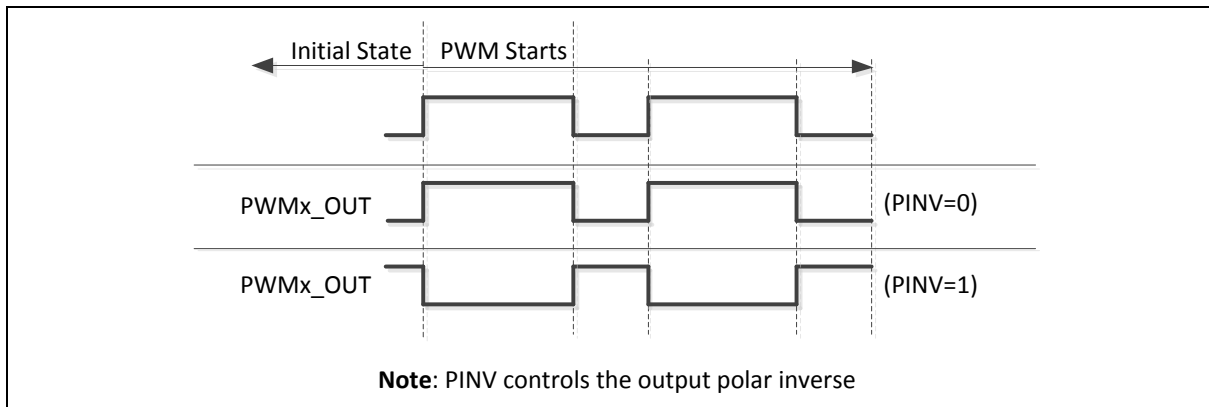

Figure 6.7-19 PWMx_OUT Polarity Control

6.7.6.10 PWM Interrupt Generator

There are independent interrupts for each PWM as shown in Figure 6.7-20.

The PWM interrupt (PWMx_INT) comes from PWM complementary pair events. The counter can generate the period point interrupt flag PIF (TIMERx_PWMINTSTS0[1]). When counter equals to the comparator value stored in CMP (TIMERx_PWMCMPDAT[15:0]) at up-count direction, the comparator up interrupt flag CMPUIF (TIMERx_PWMINTSTS0[2]) is set. If the corresponding interrupt enable bits are set, the interrupt trigger events will also generates interrupt signals.

Figure 6.7-20 PWM Interrupt Architecture Diagram

6.7.6.11 PWM Wake-up Generator

User can sets PWMINTWKEN (TIMERx_PWMCTL[12]) high to wake up when PWM interrupt occurs. Before enter power-down mode, user must select LXT or LIRC as PWM clock source.

When PWM wake-up occurs, PWMINTWKF (TIMERx_PWMSTATUS[8]) is set to 1. User can write 1 to this bit to clear this flag.

Figure 6.7-21 PWM Wake-up Architecture Diagram

6.7.6.12 PWM Trigger EADC, PDMA, DAC Generator

PWM counter event can be one of the EADC, PDMA, DAC conversion trigger source. User sets TRGSEL (TIMERx_PWMTRGCTL[1:0]) to select which PWM counter event can trigger conversion.

When the PWMTRGEADC (TIMERx_PWMTRGCTL[7]) is set to 1, the PWM can trigger EADC. When the PWMTRGDAC (TIMERx_PWMTRGCTL[8]) is set to 1, the PWM can trigger DAC. When the PWMTRGPDMA (TIMERx_PWMTRGCTL[9]) is set to 1, the PWM can trigger PDMA.

There are three PWM counter events can be selected as the trigger source to start conversion as shown in Figure 6.7-22.

The PWM interrupt, wake-up and trigger comparison table is shown as Table 6.7-6.

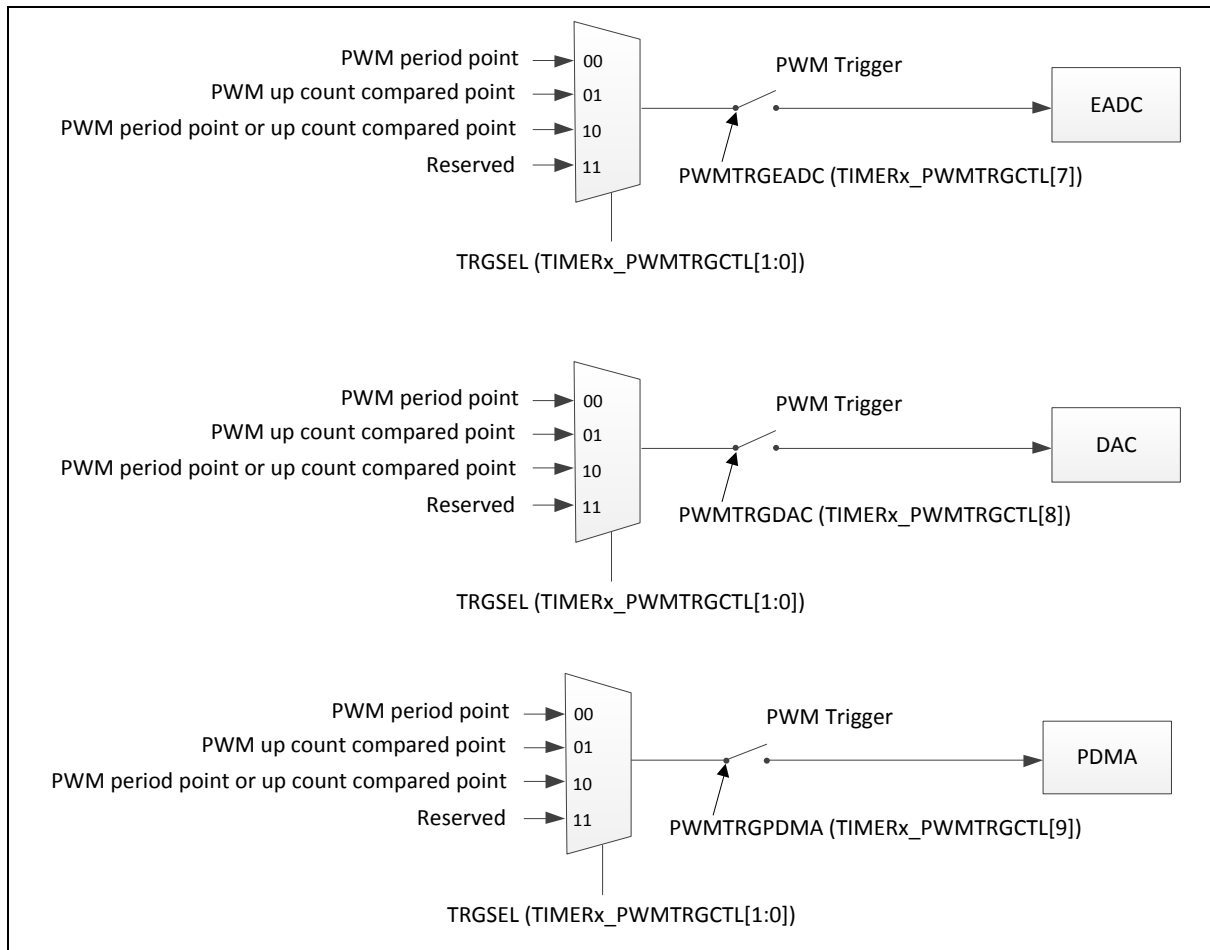

Figure 6.7-22 PWM Trigger Block Diagram

Functions		Interrupt	Wake-Up		Trigger
			PWMINTWKEN (TIMERx_PWMCTL[12])		
Events			= 0	= 1	
CNT = CMP	CMPUIEN = 1	Yes	No	Yes	EADC, DAC, PDMA (Note1)
	CMPUIEN = 0	No	No	No	No
CNT = PERIOD	PIEN = 1	Yes	No	Yes	EADC, DAC, PDMA (Note1)
	PIEN = 0	No	No	No	No

Table 6.7-6 PWM Interrupt, Wake-up and Trigger Events Comparison

Note: Set TRGSEL (TIMERx_PWMTRGCTL[1:0]) to select trigger event and sets PWMTRGEADC (TIMERx_PWMTRGCTL[7]), PWMTRGPWM (TIMERx_PWMTRGCTL[8]), PWMTRGPDMA (TIMERx_PWMTRGCTL[9]) to select which device will be triggered.

6.7.6.13 Mode Transition

If user needs to change timer mode to PWM mode or PWM mode to timer mode, user must do reset before change mode or check the previous mode is end.

The Timer mode to PWM mode transition steps are shown below.

1. Set Timer CNTEN (TIMERx_CTL[30]) as 0
2. Polling ACTSTS (TIMERx_CTL[25]). If ACTSTS is 0, user can set FUNCSEL (TIMERx_CTL[15]) as 1 to enable PWM mode.
3. PWM function settings.

The PWM mode to Timer mode transition steps are shown below.

4. Set PWM CNTEN (TIMERx_PWMCTL[0]) as 0.
5. Set FUNCSEL as 0 to disable PWM mode.
6. Polling FUNCSEL. If FUNCSEL is 0, user can set Timer settings.

6.7.7 LRegister Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

Bits	Description
[31]	<p>ICEDEBUG</p> <p>ICE Debug Mode Acknowledge Disable Bit (Write Protect) 0 = ICE debug mode acknowledgement effects TIMER counting. TIMER counter will be held while CPU is held by ICE. 1 = ICE debug mode acknowledgement Disabled. TIMER counter will keep going no matter CPU is held by ICE or not. Note: This bit is write protected. Refer to the SYS_REGLCTL register.</p>
[30]	<p>CNTEN</p> <p>Timer Counting Enable Bit 0 = Stops/Suspends counting. 1 = Starts counting. Note 1: In stop status, and then set CNTEN to 1 will enable the 24-bit up counter to keep counting from the last stop counting value. Note 2: This bit is auto-cleared by hardware in one-shot mode (TIMER_CTL[28:27] = 00) when the timer time-out interrupt flag TIF (TIMERx_INTSTS[0]) is generated. Note 3: Set enable/disable this bit needs 2 * TMR_CLK period to become active, user can read ACTSTS (TIMERx_CTL[25]) to check enable/disable command is completed or not.</p>
[29]	<p>INTEN</p> <p>Timer Interrupt Enable Bit 0 = Timer time-out interrupt Disabled. 1 = Timer time-out interrupt Enabled. Note: If this bit is enabled, when the timer time-out interrupt flag TIF is set to 1, the timer interrupt signal is generated and inform to CPU.</p>
[28:27]	<p>OPMODE</p> <p>Timer Counting Mode Select</p>

		00 = The timer controller is operated in One-shot mode. 01 = The timer controller is operated in Periodic mode. 10 = The timer controller is operated in Toggle-output mode. 11 = The timer controller is operated in Continuous Counting mode.
[26]	Reserved	Reserved.
[25]	ACTSTS	Timer Active Status Bit (Read Only) This bit indicates the 24-bit up counter status. 0 = 24-bit up counter is not active. 1 = 24-bit up counter is active. Note: This bit may active when CNT 0 transition to CNT 1.
[24]	EXTCNTEN	Event Counter Mode Enable Bit This bit is for external counting pin function enabled. 0 = Event counter mode Disabled. 1 = Event counter mode Enabled. Note: When timer is used as an event counter, this bit should be set to 1 and select PCLK as timer clock source.
[23]	WKEN	Wake-up Function Enable Bit If this bit is set to 1, while timer interrupt flag TIF (TIMERx_INTSTS[0]) is 1 and INTEN (TIMERx_CTL[29]) is enabled, the timer interrupt signal will generate a wake-up trigger event to CPU. 0 = Wake-up function Disabled if timer interrupt signal generated. 1 = Wake-up function Enabled if timer interrupt signal generated.
[22]	CAPSRC	Capture Pin Source Selection 0 = Capture Function source is from TMx_EXT (x= 0~3) pin. 1 = Capture Function source is from internal ACMP output signal , internal clock (MIRC, LIRC, HIRC), or external clock (HXT, LXT). Note: When CAPSRC = 1, User can set INTERCAPSEL (TIMERx_EXTCTL[10:8]) to decide which internal ACMP output signal or which clock is as timer capture source.
[21]	TGLPINSEL	Toggle-output Pin Select 0 = Toggle mode output to TMx (Timer Event Counter Pin). 1 = Toggle mode output to TMx_EXT (Timer External Capture Pin).
[20]	PERIOSEL	Periodic Mode Behavior Selection Enable Bit 0 = The behavior selection in periodic mode is Disabled. When user updates CMPDAT while timer is running in periodic mode, CNT will be reset to default value. 1 = The behavior selection in periodic mode is Enabled. When user updates CMPDAT while timer is running in periodic mode, the limitations as bellows list, If updated CMPDAT value > CNT, CMPDAT will be updated and CNT keep running continually. If updated CMPDAT value = CNT, timer time-out interrupt will be asserted immediately. If updated CMPDAT value < CNT, CNT will be reset to default value.
[19]	INTRGEN	Inter-timer Trigger Mode Enable Bit Setting this bit will enable the inter-timer trigger capture function. The Timer0/2 will be in event counter mode and counting with external clock source or event. Also, Timer1/3 will be in trigger-counting mode of capture function. 0 = Inter-Timer Trigger Capture mode Disabled. 1 = Inter-Timer Trigger Capture mode Enabled.

		Note: For Timer1/3, this bit is ineffective and the read back value is always 0.
[18:16]	Reserved	Reserved.
[15]	FUNCSEL	<p>Function Selection</p> <p>0 = Timer controller is used as timer function. 1 = Timer controller is used as PWM function.</p> <p>Note: When timer is used as PWM, the clock source of time controller will be forced to PCLKx automatically.</p>
[14:8]	Reserved	Reserved.
[7:0]	PSC	<p>Prescale Counter</p> <p>Timer input clock or event source is divided by (PSC+1) before it is fed to the timer up counter. If this field is 0 (PSC = 0), then there is no scaling.</p> <p>Note: Update prescale counter value will reset internal 8-bit prescale counter and 24-bit up counter value.</p>

Timer Comparator Register (TIMERx_CMP)

Register	Offset	R/W	Description	Reset Value
TIMER0_CMP	TMR01_BA+0x04	R/W	Timer0 Comparator Register	0x0000_0000
TIMER1_CMP	TMR01_BA+0x104	R/W	Timer1 Comparator Register	0x0000_0000

CMPDAT							

Bits	Description	
[31:24]	Reserved	Reserved.
[23:0]	CMPDAT	<p>Timer Comparator Value</p> <p>CMPDAT is a 24-bit compared value register. When the internal 24-bit up counter value is equal to CMPDAT value, the TIF (TIMERx_INTSTS[0] Timer Interrupt Flag) will set to 1.</p> <p>Time-out period = (Period of timer clock input) * (8-bit PSC + 1) * (24-bit CMPDAT).</p> <p>Note 1: Never write 0x0 or 0x1 in CMPDAT field, or the core will run into unknown state.</p> <p>Note 2: When timer is operating at continuous counting mode, the 24-bit up counter will keep counting continuously even if user writes a new value into CMPDAT field. But if timer is operating at other modes, the 24-bit up counter will restart counting from 0 and using newest CMPDAT value to be the timer compared value while user writes a new value into CMPDAT field.</p>

Timer Interrupt Status Register (TIMERx_INTSTS)

CNT							

Bits	Description
[31]	<p>RSTACT</p> <p>Timer Data Register Reset Active (Read Only) This bit indicates if the counter reset operation active. When user writes this CNT register, timer starts to reset its internal 24-bit timer up-counter to 0 and reload 8-bit pre-scale counter. At the same time, timer set this flag to 1 to indicate the counter reset operation is in progress. Once the counter reset operation done, timer clear this bit to 0 automatically. 0 = Reset operation is done. 1 = Reset operation triggered by writing TIMERx_CNT is in progress.</p>
[30:24]	<p>Reserved</p> <p>Reserved.</p>
[23:0]	<p>CNT</p> <p>Timer Data Register Read operation. Read this register to get CNT value. For example: If EXTCNTEN (TIMERx_CTL[24]) is 0, user can read CNT value for getting current 24-bit counter value. If EXTCNTEN (TIMERx_CTL[24]) is 1, user can read CNT value for getting current 24-bit event input counter value. Write operation. Writing any value to this register will reset current CNT value to 0 and reload internal 8-bit prescale counter.</p>

Timer Capture Data Register (TIMERx_CAP)

6.8 Watchdog Timer (WDT)

6.8.1 Overview

The Watchdog Timer (WDT) is used to perform a system reset when system runs into an unknown state. This prevents system from hanging for an infinite period of time. Besides, this Watchdog Timer supports the function to wake up system from Idle/Power-down mode.

6.8.2 Features

- 20-bit free running up counter for WDT time-out interval
- Selectable time-out interval ($2^4 \sim 2^{20}$) and the time-out interval is 417us ~ 27.3 s if WDT_CLK = 38.4 kHz (LIRC).
- System kept in reset state for a period of $(1 / \text{WDT_CLK}) * 63$
- Supports selectable WDT reset delay period, including 1026, 130, 18 or 3 WDT_CLK reset delay period
- Supports to force WDT enabled after chip powered on or reset by setting CWDTEN[2:0] in Config0 register
- Supports WDT time-out wake-up function only if WDT clock source is selected as 38.4 kHz LIRC or LXT.

6.8.3 Block Diagram

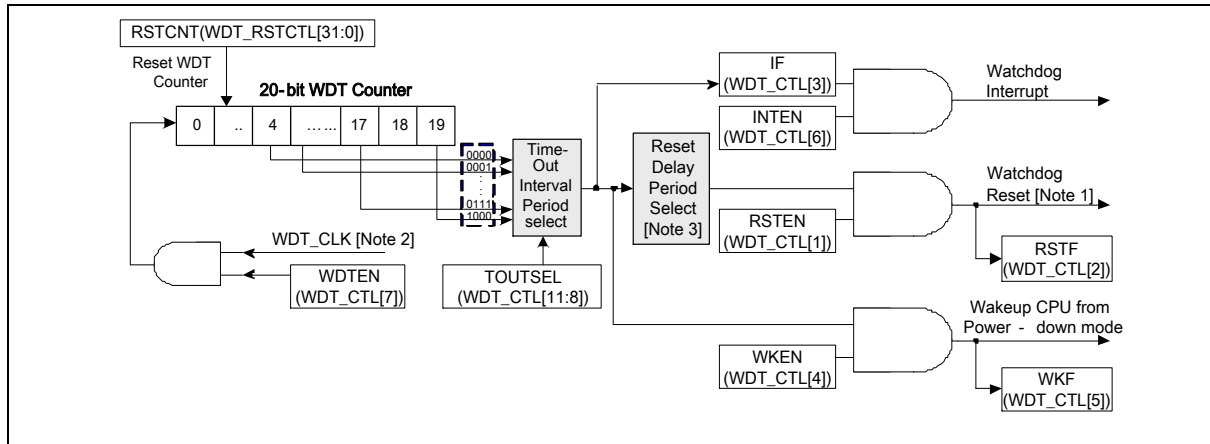

Figure 6.8-1 Watchdog Timer Block Diagram

Note1: WDT resets CPU and lasts 63 WDT_CLK.

Note2: The WDT reset delay period can be selected as 3/18/130/1026 WDT_CLK.

Note3: Chip can be woken up by WDT time-out interrupt signal generated only if WDT clock source is selected to LIRC or LXT.

6.8.4 Basic Configuration

- Clock Source Configuration
 - Select the source of WDT peripheral clock on WDTSEL (CLK_CLKSEL1[1:0])
 - Enable WDT peripheral clock in WDTCKEN (CLK_APBCLK0[0]).
 - Force enable WDT controller after chip powered on or reset in CWDTEN[2:0] (CWDTEN[2] is Config0[31], CWDTEN[1:0] is Config0[4:3])

- WDT clock source can be changed only if CWDTEN[2:0] is 111

The WDT clock control is shown in Figure 6.8-2.

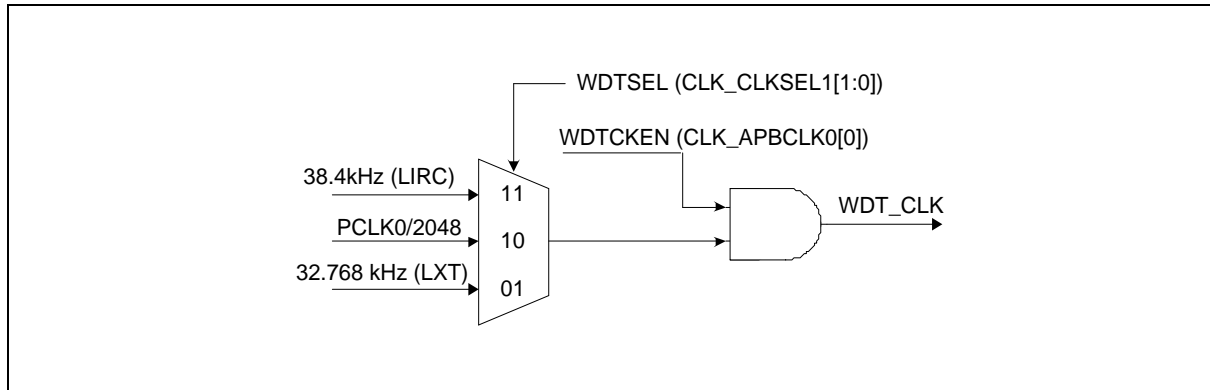

Figure 6.8-2 Watchdog Timer Clock Control

6.8.5 Functional Description

The WDT includes an 20-bit free running up counter with programmable time-out intervals. Table 6.8-1 shows the WDT time-out interval period selection and Figure 6.8-3 shows the WDT time-out interval and reset period timing.

6.8.5.1 WDT Time-out Interrupt

Setting WDTEN (WDT_CTL [7]) to 1 will enable the WDT function and the WDT counter to start counting up. The SYNC (WDT_CTL[30]) can be indicated whether enable/disable WDTEN function is completed or not. There are eight time-out interval period can be selected by setting TOUTSEL (WDT_CTL[10:8]). When the WDT up counter reaches the TOUTSEL (WDT_CTL[11:8]) settings, WDT time-out interrupt will occur then WDT time-out interrupt flag IF (WDT_CTL[3]) will be set to 1 immediately. If INTEN (WDT_CTL[6]) is enabled, WDT time-out interrupt will inform CPU.

6.8.5.2 WDT Reset Delay Period and Reset System

There is a specified T_{RSTD} reset delay period follows the IF (WDT_CTL[3]) is setting to 1. User should set WDT_RSTCNT to reset the 20-bit WDT up counter value to avoid generate WDT time-out reset signal before the T_{RSTD} reset delay period expires. Moreover, user should set RSTDSEL (WDT_ALTCTL [1:0]) to select reset delay period to clear WDT counter. If the WDT up counter value has not been cleared after the specific T_{RSTD} delay period expires, the WDT control will set RSTF (WDT_CTL[2]) to 1 if RSTEN (WDT_CTL[1]) bit is enabled, then chip enters to reset state immediately. T_{RST} reset period will keep last 63 WDT clocks then chip restart executing program from reset vector (0x0000_0000). The RSTF (WDT_CTL[2]) will keep 1 after WDT time-out resets the chip, user can check RSTF (WDT_CTL[2]) by software to recognize the system has been reset by WDT time-out reset or not.

TOUTSEL	Time-Out Interval Period T_{TIS}	Reset Delay Period T_{RSTD}
0000	$2^4 * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
0001	$2^6 * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
0010	$2^8 * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
0011	$2^{10} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
0100	$2^{12} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
0101	$2^{14} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
0110	$2^{16} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
0111	$2^{18} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
1000	$2^{20} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$

Table 6.8-1 Watchdog Timer Time-out Interval Period Selection

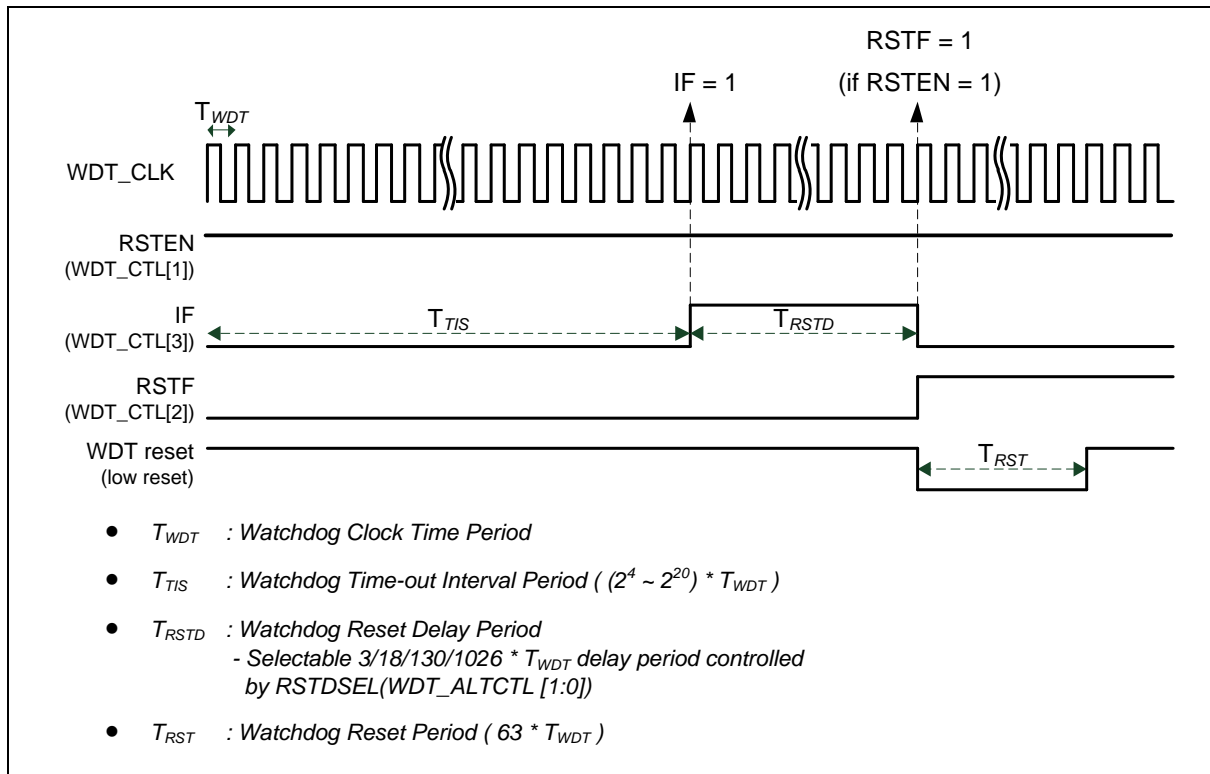

Figure 6.8-3 Watchdog Timer Time-out Interval and Reset Period Timing

6.8.5.3 WDT Wake-up

If WDT clock source is selected to LIRC or LXT, system can be woken up from Power-down mode while WDT time-out interrupt signal is generated and WKEN (WDT_CTL[4]) enabled. Note that user should set LXTEN (CLK_PWRCTL [1]) or LIRCEN (CLK_PWRCTL [3]) to select clock source before system enters Power-down mode because the system peripheral clock are disabled when system is in Power-down mode. In the meanwhile, the WKF (WDT_CTL[5]) will be set to 1 automatically, and user can check WKF (WDT_CTL[5]) status by software to recognize the system has been woken up by WDT time-out interrupt or not.

6.8.5.4 WDT ICE Debug

When ICE is connected to MCU, WDT counter is counting or not by ICEDEBUG (WDT_CTL[31]). The default value of ICEDEBUG is 0, WDT counter will stop counting when CPU is held by ICE. If ICEDEBUG is set to 1, WDT counter will keep counting no matter CPU is held by ICE or not.

6.9 Window Watchdog Timer (WWDT)

6.9.1 Overview

The Window Watchdog Timer (WWDT) is used to perform a system reset within a specified window period to prevent software running to uncontrollable status by any unpredictable condition.

6.9.2 Features

- 6-bit down counter value (CNTDAT, WWDT_CNT[5:0]) and 6-bit compare value (CMPDAT, WWDT_CTL[21:16]) to make the WWDT time-out window period flexible
- Supports 4-bit value (PSCSEL, WWDT_CTL[11:8]) to programmable maximum 11-bit prescale counter period of WWDT counter
- WWDT counter suspends in Idle/Power-down mode

6.9.3 Block Diagram

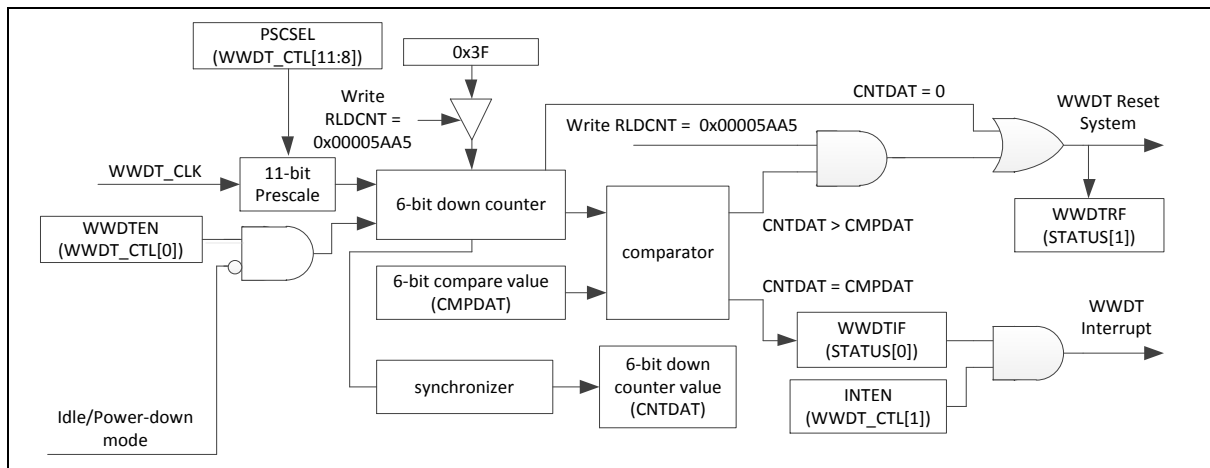

Figure 6.9-1 WWDT Block Diagram

6.9.4 Basic Configuration

- Clock Source Configuration
 - Select the source of WWDT peripheral clock on WWDTSEL (CLK_CLKSEL1[31:30])
 - Enable WWDT peripheral clock in WDTCKEN (CLK_APBCLK0[0]).

The WWDT clock control is shown in Figure 6.9-2.

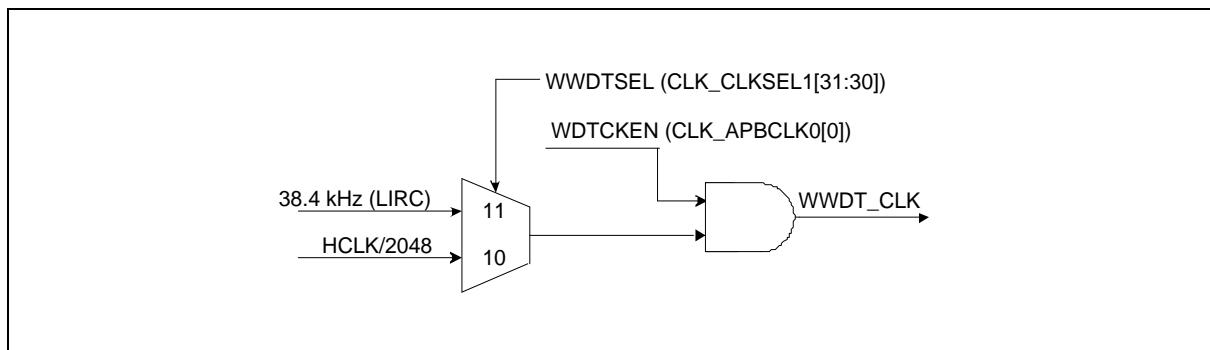

Figure 6.9-2 WWDT Clock Control

6.9.5 Functional Description

The WWDT includes a 6-bit down counter with programmable prescale value to define different WWDT time-out intervals. The clock source of 6-bit WWDT is based on system clock divide 2048 (HCLK/2048) or 38.4 kHz internal low speed RC oscillator (LIRC) with a programmable 11-bit prescale counter value which controlled by PSCSEL (WWDT_CTL[11:8]). Also, the correlate of PSCSEL (WWDT_CTL[11:8]) and prescale value are listed in Table 6.9-1.

PSCSEL	Prescaler Value	Max. Time-Out Period	Max. Time-Out Interval (WWDT_CLK=38.4 kHz)
0000	1	$1 * 64 * T_{WWDT}$	1.667 ms
0001	2	$2 * 64 * T_{WWDT}$	3.333 ms
0010	4	$4 * 64 * T_{WWDT}$	6.667 ms
0011	8	$8 * 64 * T_{WWDT}$	13.333 ms
0100	16	$16 * 64 * T_{WWDT}$	26.667 ms
0101	32	$32 * 64 * T_{WWDT}$	53.333 ms
0110	64	$64 * 64 * T_{WWDT}$	106.667 ms
0111	128	$128 * 64 * T_{WWDT}$	213.333 ms
1000	192	$192 * 64 * T_{WWDT}$	320 ms
1001	256	$256 * 64 * T_{WWDT}$	426.667 ms
1010	384	$384 * 64 * T_{WWDT}$	640 ms
1011	512	$512 * 64 * T_{WWDT}$	853.333 ms
1100	768	$768 * 64 * T_{WWDT}$	1.28 s
1101	1024	$1024 * 64 * T_{WWDT}$	1.701 s
1110	1536	$1536 * 64 * T_{WWDT}$	2.56 s
1111	2048	$2048 * 64 * T_{WWDT}$	3.413 s

Table 6.9-1 WWDT Prescaler Value Selection

6.9.5.1 WWDT Counting

When the WWDTEN (WWDT_CTL[0]) is set, WWDT down counter will start counting from 0x3F to 0. To prevent program runs to disable WWDT counter counting unexpected, the WWDT_CTL register can only be written once after chip is powered on or reset. User cannot disable WWDT counter counting (WWDTEN), change counter prescale period (PSCSEL) or change window compare value (CMPDAT) while WWDTEN (WWDT_CTL[0]) has been enabled by user unless chip is reset.

To avoid the system is reset while CPU clock is disabled, the WWDT counter will stop counting when CPU enters Idle/Power-down mode. After CPU enters normal mode, the WWDT counter will start down counting.

6.9.5.2 WWDT Compare Match Interrupt

During down counting by the WWDT counter, the WWDTIF (WWDT_STATUS[0]) is set to 1 while the WWDT counter value (CNTDAT) is equal to window compare value (CMPDAT) and WWDTIF can be cleared by user; if INTEN (WWDT_CTL[1]) is also set to 1 by user, the WWDT compare match interrupt signal is generated also while WWDTIF is set to 1 by hardware.

6.9.5.3 WWDT Reset System

Figure 6.9-3 shows three cases of WWDT reset and reload behavior.

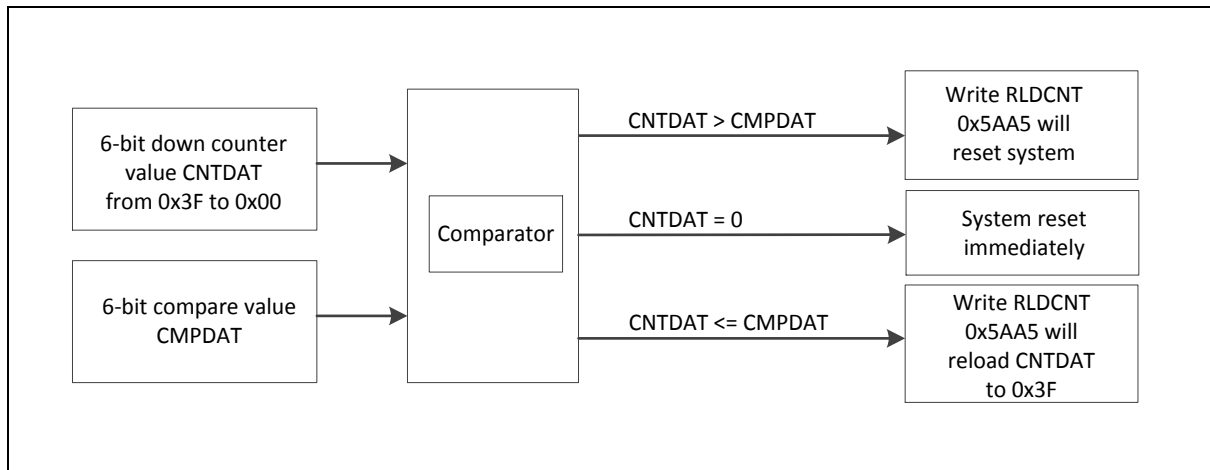

Figure 6.9-3 WWDT Reset and Reload Behavior

If the current CNTDAT (WWDT_CNT[5:0]) is larger than CMPDAT (WWDT_CTL[21:16]) and user writes 0x00005AA5 to the WWDT_RLDCNT register, the WWDT reset system signal will be generated immediately to cause chip reset also. The waveform of WWDT reload counter when CNTDAT > CMPDAT is shown in Figure 6.9-4.

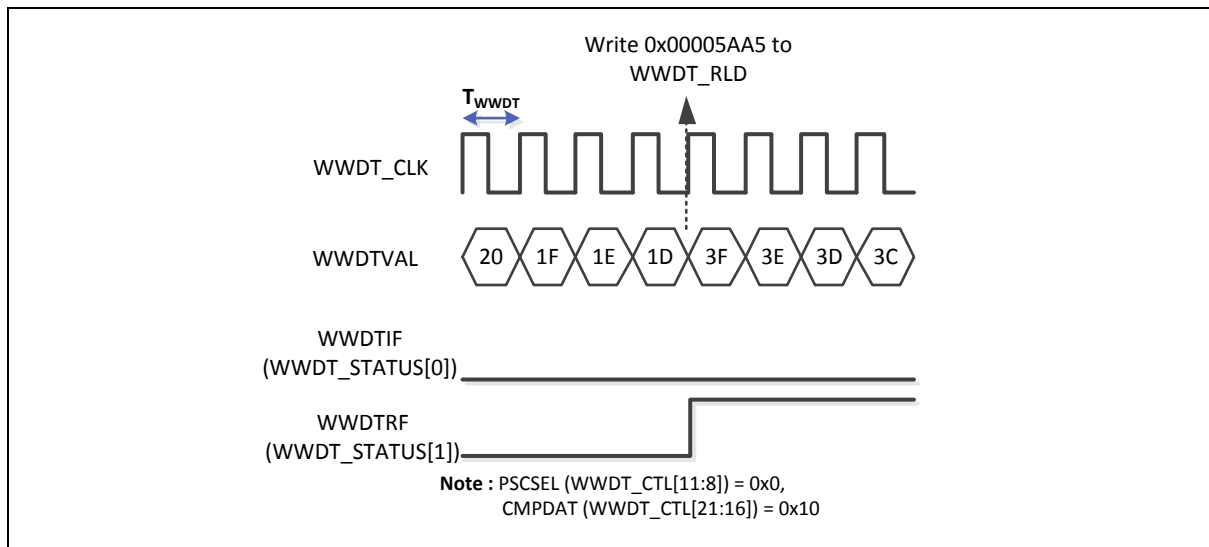

Figure 6.9-4 WWDT Reload Counter When CNTDAT > CMPDAT

When WWDTIF (WWDT_STATUS[0]) is generated, user must reload WWDT counter value to 0x3F by writing 0x00005AA5 to WWDT_RLDCNT register, and also to prevent WWDT counter value reached to 0 and generate WWDT reset system signal to inform system reset. Figure 6.9-5 shows the waveform of WWDT reload counter when CNTDAT < CMPDAT and Figure 6.9-6 shows WWDT generates reset system signal (WWDTTRF) if user doesn't write 0x00005AA5 to WWDT_RLD before WWDT counter value reaches 0.

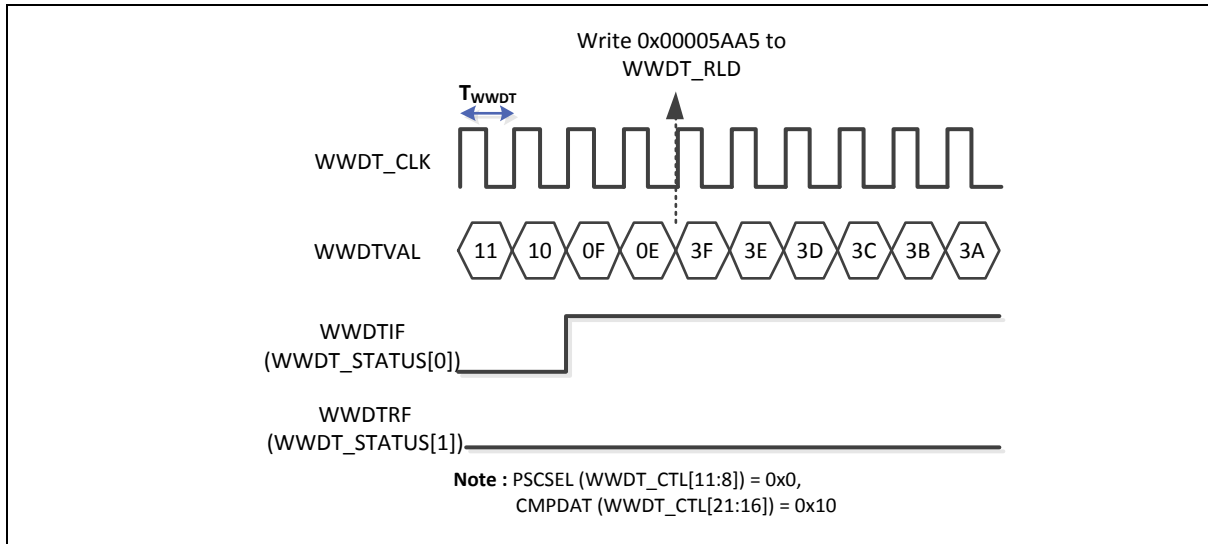

Figure 6.9-5 WWDT Reload Counter When WWDT_CNT < WINCMP

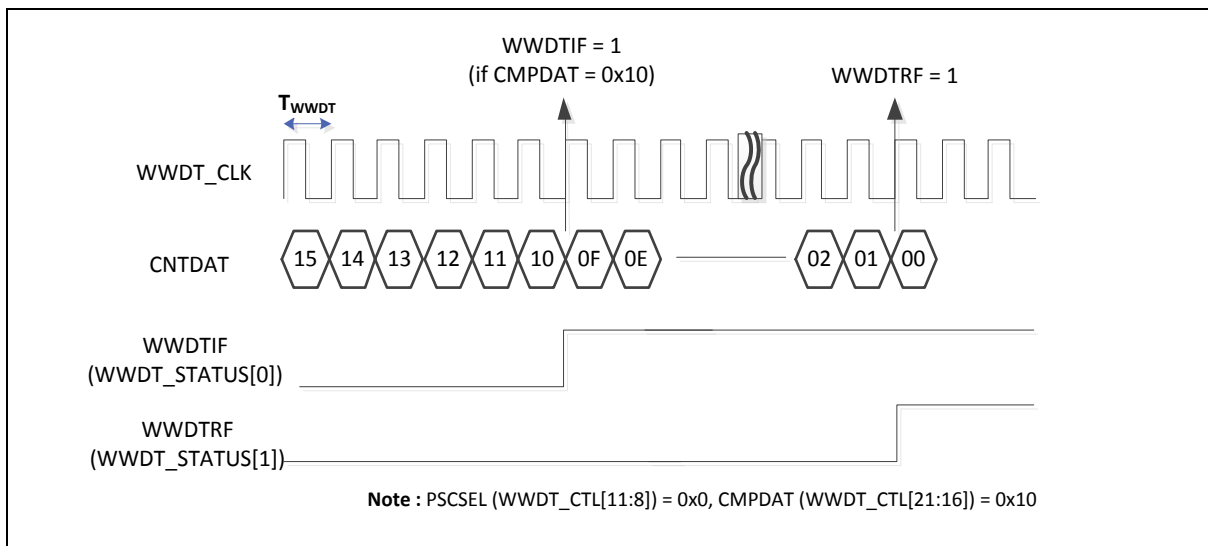

Figure 6.9-6 WWDT Interrupt and Reset Signals

6.9.5.4 WWDT Window Setting Limitation

When user writes 0x0005AA5 to WWDT_RLDCNT register to reload WWDT counter value to 0x3F, it needs 3 WWDT clocks to sync the reload command to actually perform reload action. Note that if user sets PSCSEL (WWDT_CTL[11:8]) to 0000, the counter prescale value should be as 1, and the CMPDAT (WWDT_CTL[21:16]) must be larger than 2. Otherwise, writing WWDT_RLDCNT register to reload WWDT counter value to 0x3F is unavailable, WWDTIF (WWDT_STATUS[0]) is generated, and WWDT reset system event always happened. The WWDT CMPDAT setting limitation is shown in Table 6.9-2.

If user sets CMPDATA as 0x3F and 0x0, the interrupt doesn't occur. The reset occurs when WWDT counts to 0x0, so the interrupt doesn't occur when CMPDATA is 0x0.

PSCSEL	Prescale Value	Valid CMPDAT Value
0000	1	0x3 ~ 0x3E

0001	2	0x2 ~ 0x3E
Others	Others	0x1 ~ 0x3E

Table 6.9-2 CMPDAT Setting Limitation

6.9.5.5 WWDT ICE Debug

When ICE is connected to MCU, the WWDT counter is counting or not by ICEDEBUG (WWDT_CTL[31]). The default value of ICEDEBUG is 0. The WWDT counter will stop counting when CPU is held by ICE. If ICEDEBUG is set to 1, WWDT counter will keep counting no matter CPU is held by ICE or not.

6.9.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

6.10 Real Time Clock (RTC)

6.10.1 Overview

The Real Time Clock (RTC) controller provides the real time and calendar message. The RTC offers programmable time tick and alarm match interrupts. The data format of time and calendar messages are expressed in BCD format. A digital frequency compensation feature is available to compensate external crystal oscillator frequency accuracy.

6.10.2 Features

- Supports external power pin V_{BAT} .
- Supports real time counter in RTC_TIME (hour, minute, second) and calendar counter in RTC_CAL (year, month, day) for RTC time and calendar check.
- Supports alarm time (hour, minute, second) and calendar (year, month, day) settings in RTC_TALM and RTC_CALM.
- Supports alarm time (hour, minute, second) and calendar (year, month, day) mask enable in RTC_TAMSK and RTC_CAMSK.
- Selectable 12-hour or 24-hour time scale in RTC_CLKFMT register.
-
- Supports Leap Year indication in RTC_LEAPYEAR register.
- Supports Day of the Week counter in RTC_WEEKDAY register.
- Frequency of RTC clock source compensate by RTC_FREQADJ register.
- All time and calendar message expressed in BCD format.
- Supports periodic RTC Time Tick interrupt with 8 period interval options 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 and 1 second.
- Supports RTC Time Tick and Alarm Match interrupt.
- Supports 1 Hz clock output.
- Supports chip wake-up from Idle or Power-down mode while a RTC interrupt signal is generated.
- Supports Daylight Saving Time software control in RTC_DSTCTL.
- Supports one tamper pin.
- Supports 20 bytes spare registers and tamper-pin detection to clear the content of these spare registers.

TAMPER0	TAMPER0	PF.6	MFP10

6.10.5 Functional Description

6.10.5.1 RTC Initiation

When a RTC block is powered on, RTC is at reset state. User has to write a number 0xa5eb1357 to RTC initial register INIT(RTC_INIT[31:0]) to make RTC leaving reset state. Once the INIT register is

written as 0xa5eb1357, the RTC will be in normal active state permanently. User can read INIT[0](RTC_INIT[0]) to check the RTC is at normal active state or reset state.

The RTC control registers access attributes are shown in Table 6.10-2.

Register	INIR = 0

Table 6.10-2 RTC Read/Write Enable

6.10.5.2 Frequency Compensation

Frequency compensation circuit supports dynamic compensation to adjust compensation value without reset the compensation circuit. The enable bit for dynamic compensation is DCOMPEN(RTC_CLKFMT[16]).

If enable dynamic compensation, the minimal interval to continuous writing RTC_FREQADJ is 0.24 seconds, and FCRBUSY(RTC_FREQADJ[31]) flag is used to indicate that new register write operation is prohibited. And the compensate value will load into compensation circuit after 0.24~1.16 seconds when write to RTC_FREQADJ.

The RTC_FREQADJ register allows user to make digital compensation to a clock input. Please follow the example and formula below to write the actual frequency of 32k crystal to RTC_FREQADJ register. Following are the compensation examples for higher or lower than 32768 Hz.

Example 1:

Frequency counter measurement : 32773.65 Hz

Integer Part: 32773 => RTC_FREQADJ[12:8] = 0x15, Refer the INTEGER(RTC_FREQADJ[13:8]) to get detail setting value.

Fraction Part: 0.65 X 64 = 41.6(0x2A) => RTC_FREQADJ[5:0]=0x2A

Example 2:

Frequency counter measurement : 32763.25 Hz

Integer part: 32763=> RTC_FREQADJ[12:8] = 0x0B, Refer the INTEGER(RTC_FREQADJ[13:8]) to get detail setting value.

Fraction part: 0.25 X 64 = 16(0x10) => RTC_FREQADJ[5:0] = 0x10

Note: The value of RTC_FREQADJ register will be the default value (0x0000_1000) while the compensation is not executed. User can utilize a frequency counter to measure RTC clock source via clock output function in manufacturing. In the meanwhile, user can use clock output function to check the result of RTC frequency compensation.

6.10.5.3 Time and Calendar Counter

RTC_TIME and RTC_CAL are used to load the real time and calendar. RTC_TALM and RTC_CALM are used for setup alarm time and calendar.

6.10.5.4 12/24 hour Time Scale Selection

The 12/24 hour time scale selection depends on 24HEN (RTC_CLKFMT[0]). When RTC runs as 12-hour time scale mode, RTC_TIME[21] (the high bit of TENHR[1:0]) means AM/PM indication, if RTC_TIME[21] is 1, it indicates PM time message and RTC_TIME[21] is 0 indicates AM time message.) Table 6.10-3 shows RTC_TIME mapping table of 12/24 hour time scale selection.

Note: The Hour Value Write Into RTC_TIME[21:16], Messages Are Expressed In BCD Format.			
24-Hour Time Scale (24HEN = 1)		12-Hour Time Scale (PM Time + 0x20) (24HEN = 0) (PM Time + 0x20)	
0x00 (AM12)	0x12 (PM12)	0x12 (AM12)	0x32 (PM12)
0x01 (AM01)	0x13 (PM01)	0x01 (AM01)	0x21 (PM01)
0x02 (AM02)	0x14 (PM02)	0x02 (AM02)	0x22 (PM02)
0x03 (AM03)	0x15 (PM03)	0x03 (AM03)	0x23 (PM03)
0x04 (AM04)	0x16 (PM04)	0x04 (AM04)	0x24 (PM04)
0x05 (AM05)	0x17 (PM05)	0x05 (AM05)	0x25 (PM05)
0x06 (AM06)	0x18 (PM06)	0x06 (AM06)	0x26 (PM06)
0x07 (AM07)	0x19 (PM07)	0x07 (AM07)	0x27 (PM07)
0x08 (AM08)	0x20 (PM08)	0x08 (AM08)	0x28 (PM08)
0x09 (AM09)	0x21 (PM09)	0x09 (AM09)	0x29 (PM09)
0x10 (AM10)	0x22 (PM10)	0x10 (AM10)	0x30 (PM10)
0x11 (AM11)	0x23 (PM11)	0x11 (AM11)	0x31 (PM11)

Table 6.10-3 12/24 Hour Time Scale Selection

6.10.5.5 Day of the Week Counter

The RTC controller provides day of week in WEEKDAY bits (RTC_WEEKDAY[2:0]). The value is defined from 0 to 6 to represent Sunday to Saturday respectively.

6.10.5.6 Periodic Time Tick Interrupt

The periodic time tick interrupt has 8 period interval options 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 and 1 second that are selected by TICK bits (RTC_TICK[2:0]). When Periodic Time Tick interrupt is enabled by setting TICKIEN (RTC_INTEN[1]) to 1, the Periodic Time Tick interrupt is requested periodically in the period selected by RTC_TICK[2:0] settings.

6.10.5.7 Alarm Interrupt

When the real time and calendar message in RTC_TIME and RTC_CAL registers are equal to alarm time and calendar values in RTC_TALM and RTC_CALM registers, the RTC alarm interrupt flag ALMIF (RTC_INTSTS[0]) is set to 1 and the RTC alarm interrupt signal assert if the alarm interrupt enable ALMIEN (RTC_INTEN[0]) is enabled.

The RTC controller provides time alarm mask register (RTC_TAMSK register) and Calendar Alarm Mask Register (RTC_CAMSK register) to mask the specified digit and generate periodic interrupt without changing the alarm match condition in RTC_TALM and RTC_CALM registers in each alarm interrupt service routine.

6.10.5.8 Daylight Saving Time

The RTC controller also provides RTC_DSTCTL register to store the control settings of daylight saving time application. User can read DSBK(RTC_DSTCTL[2]) value to check current RTC date/time counter runs in daylight saving time mode or normal mode.

6.10.5.9 1 Hz Clock Output

The RTC controller provides 1Hz clock output to CLKO function pin. User can set CLK1HZEN (CLK_CLKOCTL[6]) to 1 and enable RTC, 1Hz clock will output to CLKO function pin.

6.10.5.10 Application Note

1. All data in RTC_TALM, RTC_CALM, RTC_TIME and RTC_CAL registers are all expressed in BCD format.
2. User has to make sure that the loaded values are reasonable. For example, Load RTC_CAL as 201a (year), 13 (month), 00 (day), or RTC_CAL does not match with RTC_WEEKDAY, etc.
3. In RTC_CAL and RTC_CALM, only 2 BCD digits are used to express "year". The 2 BCD digits of xy means 20xy, rather than 19xy or 21xy.
4. Example of 12-Hour Time Setting
If current RTC time is PM12:59:30 in 12-Hour Time Scale mode, the RTC_TIME setting as:
 HOUR:
 RTC_TIME[21:16]: 0x32 (0x12+0x20) combined by TENHR (RTC_TIME[21:20]) is 0x3, HR (RTC_TIME[19:16]) is 0x2.
 MIN:
 RTC_TIME[14:8]: 0x59 combined by TENMIN (RTC_TIME[14:12]) is 0x5, MIN (RTC_TIME[11:8]) is 0x9.
 SEC:
 RTC_TIME[6:0]: 0x30 combined by TENSEC (RTC_TIME[6:4]) is 0x3, SEC (RTC_TIME[3:0]) is 0x0.
5. Table 6.10-4 shows registers value after both core power and battery power are first powered on.

Register	Reset State
----------	-------------

RTC_INIT	0
RTC_CAL	15/8/8 (year/month/day)

RTC_INTSTS	Core Power Domain
Others	Battery Power Domain

Table 6.10-5 Registers Power Domain

6.10.5.11 Spare Registers and Tamper Detector

The RTC module is equipped with 20 bytes spare registers to store user’s important information. These spare registers are located in RTC domain, user needs to enable SPRWEN (RTC_SPRCTL[2]) before writing one of 20 spare registers (RTC_SPR0 ~ RTC_SPR4 and the spare registers will be cleared automatically after the TAPMER occur.

When the transition condition defined in RTC_TAMPCTL is detected on the tamper pin which is defined in the GPF[6], tamper detected interrupt flag TAMP0IF (RTC_INTSTS[8]) will be generated. Meanwhile, the 20 bytes spare registers (RTC_SPR0 ~ RTC_SPR4) content will be cleared automatically by hardware to prevent the security data be disclosure and current RTC time and calendar will be loaded to RTC_TAMPTIME and RTC_TAMPCAL registers, these values only can be cleared automatically or update again when the TAMP0IF is cleared to 0. And if TAMP0IF is set to 1, the interrupt is generated to NVIC if the tamper detect interrupt is activated.

The RTC supports one tamper pin. The TAMP0LV (RTC_TAMPCTL[9]) depends on level attribute of TAMPER0 pin for tamper detection.

Static Tamper Programming Sequence Example

- (1) Clean the TAMP0IF (RTC_INTSTS[8]).
- (2) Set TAMP0LV (RTC_TAMPCTL[9]) and TAMP0DBEN (RTC_TAMPCTL[10]).
- (3) Enable TAMP0EN (RTC_TAMPCTL[8]).

6.10.5.12 Backup Domain GPIO Function

There are 3 I/O pins, PF.6, PF.5 and PF.4, can be backup in the V_{BAT} domain. When PF.6 is not used as tamper pin, it can be used as GPIO pin function. And PF.4/X32O and PF.5/X32I pins are not used as low speed 32K oscillator function, they can be used as GPIO pin function. The IOCTLSEL (RTC_LXTCTL[8]) is used to select the PF.4/X32O, PF.5/X32I and PF.6/TAMPER0 pins are controlled by RTC or GPIO module. Figure 6.10-2 shows backup I/O control diagram.

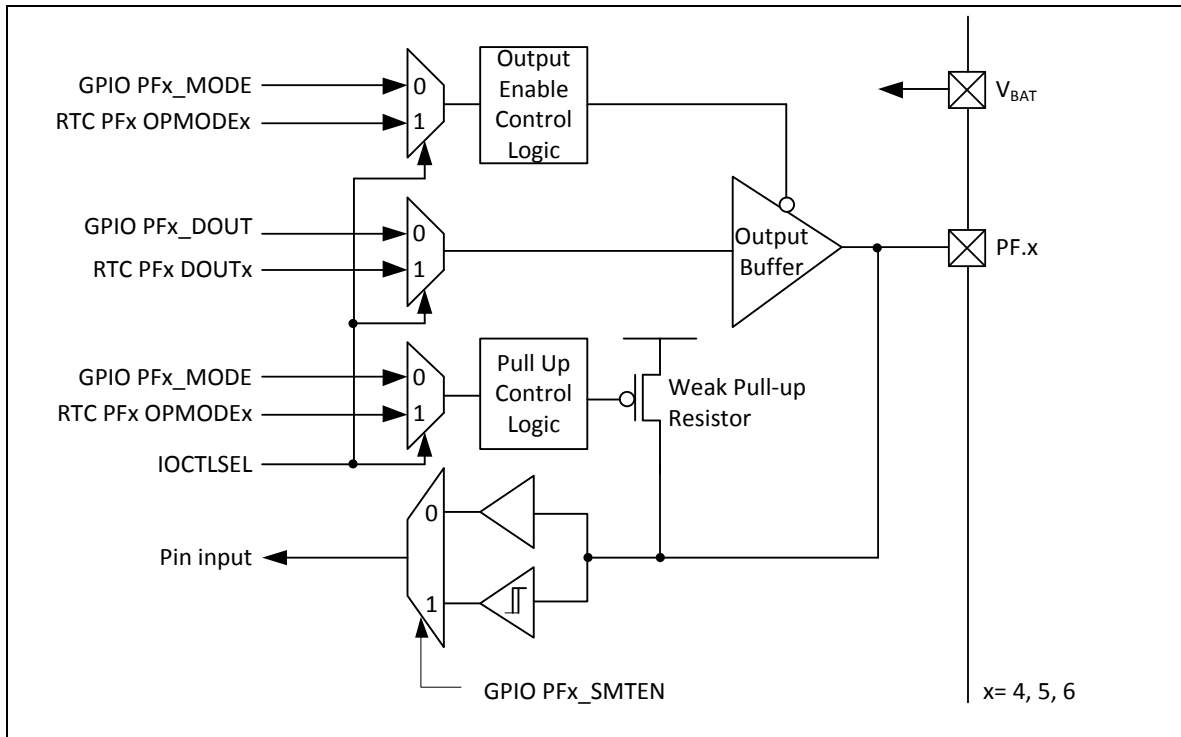

Figure 6.10-2 Backup I/O Control Diagram

6.10.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
RTC Base Address:				
RTC_BA = 0x4004_1000				
RTC_INIT	RTC_BA+0x00	R/W	RTC Initiation Register	0x0000_0000
RTC_FREQADJ	RTC_BA+0x08	R/W	RTC Frequency Compensation Register	0x0000_1000
RTC_TIME	RTC_BA+0x0C	R/W	RTC Time Loading Register	0x0000_0000
RTC_CAL	RTC_BA+0x10	R/W	RTC Calendar Loading Register	0x0015_0808
RTC_CLKFMT	RTC_BA+0x14	R/W	RTC Time Scale Selection Register	0x0000_0001
RTC_WEEKDAY	RTC_BA+0x18	R/W	RTC Day of the Week Register	0x0000_0006
RTC_TALM	RTC_BA+0x1C	R/W	RTC Time Alarm Register	0x0000_0000
RTC_CALM	RTC_BA+0x20	R/W	RTC Calendar Alarm Register	0x0000_0000
RTC_LEAPYEAR	RTC_BA+0x24	R	RTC Leap Year Indicator Register	0x0000_0000
RTC_INTEN	RTC_BA+0x28	R/W	RTC Interrupt Enable Register	0x0000_0000
RTC_INTSTS	RTC_BA+0x2C	R/W	RTC Interrupt Status Register	0x0000_0000
RTC_TICK	RTC_BA+0x30	R/W	RTC Time Tick Register	0x0000_0000
RTC_TAMSK	RTC_BA+0x34	R/W	RTC Time Alarm Mask Register	0x0000_0000

RTC_SPR4	RTC_BA+0x50	R/W	RTC Spare Register 4	0x0000_0000
RTC_LXTCTL	RTC_BA+0x100	R/W	RTC 32.768 KHz Oscillator Control Register	0x780F_000E
RTC_GPIOCTL0	RTC_BA+0x104	R/W	RTC GPIO Control 0 Register	0x0000_0000
RTC_DSTCTL	RTC_BA+0x110	R/W	RTC Daylight Saving Time Control Register	0x0000_0000
RTC_TAMPCTL	RTC_BA+0x120	R/W	RTC Tamper Pin Control Register	0x0000_0000
RTC_TAMPTIME	RTC_BA+0x130	R	RTC Tamper Time Register	0x0000_0000
RTC_TAMPICAL	RTC_BA+0x134	R	RTC Tamper Calendar Register	0x0000_0000

6.10.7 Register Description

RTC Initiation Register (RTC_INIT)

Register	Offset	R/W	Description	Reset Value
RTC_INIT	RTC_BA+0x00	R/W	RTC Initiation Register	0x0000_0000

31	30	29	28	27	26	25	24
INIT							
23	22	21	20	19	18	17	16
INIT							
15	14	13	12	11	10	9	8
INIT							
7	6	5	4	3	2	1	0
INIT							INIT/ACTIVE

Bits	Description	
[31:1]	INIT[31:1]	<p>RTC Initiation (Write Only)</p> <p>When RTC block is powered on, RTC is at reset state. User has to write a number (0x a5eb1357) to INIT to make RTC leave reset state. Once the INIT is written as 0xa5eb1357, the RTC will be in un-reset state permanently.</p> <p>The INIT is a write-only field and read value will be always 0.</p>
[0]	INIT[0]/ACTIVE	<p>RTC Active Status (Read Only)</p> <p>0 = RTC is at reset state.</p> <p>1 = RTC is at normal active state.</p>

RTC Frequency Compensation Register (RTC_FREQADJ)

Register	Offset	R/W	Description	Reset Value
RTC_FREQADJ	RTC_BA+0x08	R/W	RTC Frequency Compensation Register	0x0000_1000

31	30	29	28	27	26	25	24
FCRBUSY		Reserved					
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved			INTEGER				
7	6	5	4	3	2	1	0
Reserved		FRACTION					

Bits	Description
[31]	<p>FCRBUSY</p> <p>Frequency Compensation Register Write Operation Busy (Read Only) 0 = The new register write operation is acceptable. 1 = The last write operation is in progress and new register write operation prohibited. Note: This bit is only used when DCOMPEN(RTC_CLKFMT[16]) enabled.</p>
[30:13]	Reserved.
[12:8]	<p>INTEGER</p> <p>Integer Part 00000 = Integer part of detected value is 32752. 00001 = Integer part of detected value is 32753. 00010 = Integer part of detected value is 32754. 00011 = Integer part of detected value is 32755. 00100 = Integer part of detected value is 32756. 00101 = Integer part of detected value is 32757. 00110 = Integer part of detected value is 32758. 00111 = Integer part of detected value is 32759. 01000 = Integer part of detected value is 32760. 01001 = Integer part of detected value is 32761. 01010 = Integer part of detected value is 32762. 01011 = Integer part of detected value is 32763. 01100 = Integer part of detected value is 32764. 01101 = Integer part of detected value is 32765. 01110 = Integer part of detected value is 32766. 01111 = Integer part of detected value is 32767. 10000 = Integer part of detected value is 32768. 10001 = Integer part of detected value is 32769. 10010 = Integer part of detected value is 32770. 10011 = Integer part of detected value is 32771. 10100 = Integer part of detected value is 32772. 10101 = Integer part of detected value is 32773.</p>

		10110 = Integer part of detected value is 32774. 10111 = Integer part of detected value is 32775. 11000 = Integer part of detected value is 32776. 11001 = Integer part of detected value is 32777. 11010 = Integer part of detected value is 32778. 11011 = Integer part of detected value is 32779. 11100 = Integer part of detected value is 32780. 11101 = Integer part of detected value is 32781. 11110 = Integer part of detected value is 32782. 11111 = Integer part of detected value is 32783.
[7:6]	Reserved	Reserved.
[5:0]	FRACTION	Fraction Part Formula: FRACTION = (fraction part of detected value) X 64. Note: Digit in FCR must be expressed as hexadecimal number.

Note: If dynamic compensation is not enable, i.e. DCOMPEN(RTC_CLKFMT[16]) = 0, FREQADJ's counter will be reset for start to compensate when writing RTC_FREQADJ. Imply RTC Time will be restarted.

RTC Time Loading Register (RTC_TIME)

Register	Offset	R/W	Description	Reset Value
RTC_TIME	RTC_BA+0x0C	R/W	RTC Time Loading Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved		TENHR			HR		
15	14	13	12	11	10	9	8
Reserved	TENMIN			MIN			
7	6	5	4	3	2	1	0
Reserved	TENSEC			SEC			

Bits	Description	
[31:22]	Reserved	Reserved.
[21:20]	TENHR	10-Hour Time Digit (0~2) When RTC runs as 12-hour time scale mode, RTC_TIME[21] (the high bit of TENHR[1:0]) means AM/PM indication (If RTC_TIME[21] is 1, it indicates PM time message.)
[19:16]	HR	1-Hour Time Digit (0~9)
[15]	Reserved	Reserved.
[14:12]	TENMIN	10-Min Time Digit (0~5)
[11:8]	MIN	1-Min Time Digit (0~9)
[7]	Reserved	Reserved.
[6:4]	TENSEC	10-Sec Time Digit (0~5)
[3:0]	SEC	1-Sec Time Digit (0~9)

Note:

1. RTC_TIME is a BCD digit counter and RTC will not check loaded data.
2. The reasonable value range is listed in the parenthesis.
3. FREQADJ's counter will be reset for start to Compensatie when writing RTC_FREQADJ , RTC_TIME, RTC_CAL, RTC_WEEKDAY. Imply RTC Time will be restarted.

RTC Calendar Loading Register (RTC_CAL)

Register	Offset	R/W	Description	Reset Value
RTC_CAL	RTC_BA+0x10	R/W	RTC Calendar Loading Register	0x0015_0808

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
TENYEAR				YEAR			
15	14	13	12	11	10	9	8
Reserved			TENMON	MON			
7	6	5	4	3	2	1	0
Reserved		TENDAY		DAY			

Bits	Description	
[31:24]	Reserved	Reserved.
[23:20]	TENYEAR	10-Year Calendar Digit (0~9)
[19:16]	YEAR	1-Year Calendar Digit (0~9)
[15:13]	Reserved	Reserved.
[12]	TENMON	10-Month Calendar Digit (0~1)
[11:8]	MON	1-Month Calendar Digit (0~9)
[7:6]	Reserved	Reserved.
[5:4]	TENDAY	10-Day Calendar Digit (0~3)
[3:0]	DAY	1-Day Calendar Digit (0~9)

Note:

1. RTC_CAL is a BCD digit counter and RTC will not check loaded data.
2. The reasonable value range is listed in the parenthesis.
3. FREQADJ's counter will be reset for start to Compensatie when writing RTC_FREQADJ , RTC_TIME, RTC_CAL, RTC_WEEKDAY. Imply RTC Time will be restarted.

RTC Time Scale Selection Register (RTC_CLKFMT)

Register	Offset	R/W	Description	Reset Value
RTC_CLKFMT	RTC_BA+0x14	R/W	RTC Time Scale Selection Register	0x0000_0001

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							DCOMPEN
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved							24HEN

Bits	Description	
[31:17]	Reserved	Reserved.
[16]	DCOMPEN	Dynamic Compensation Enable Bit 0 = Dynamic Compensation Disabled. 1 = Dynamic Compensation Enabled.
[15:1]	Reserved	Reserved.
[0]	24HEN	24-hour / 12-hour Time Scale Selection Indicates that RTC_TIME and RTC_TALM are in 24-hour time scale or 12-hour time scale 0 = 12-hour time scale with AM and PM indication selected. 1 = 24-hour time scale selected.

RTC Day of the Week Register (RTC_WEEKDAY)

Register	Offset	R/W	Description	Reset Value
RTC_WEEKDAY	RTC_BA+0x18	R/W	RTC Day of the Week Register	0x0000_0006

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved					WEEKDAY		

Bits	Description	
[31:3]	Reserved	Reserved.
[2:0]	WEEKDAY	Day of the Week Register 000 = Sunday. 001 = Monday. 010 = Tuesday. 011 = Wednesday. 100 = Thursday. 101 = Friday. 110 = Saturday. 111 = Reserved.

Note: FREQADJ's counter will be reset for start to Compensatie when writing RTC_FREQADJ, RTC_TIME, RTC_CAL, RTC_WEEKDAY. Imply RTC Time will be restarted.

RTC Time Alarm Register (RTC_TALM)

Register	Offset	R/W	Description	Reset Value
RTC_TALM	RTC_BA+0x1C	R/W	RTC Time Alarm Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16

15	14	13	12	11	10	9	8
Reserved	TENMIN			MIN			
7	6	5	4	3	2	1	0
Reserved	TENSEC			SEC			

Bits	Description	
[31:22]	Reserved	Reserved.
[21:20]	TENHR	10-Hour Time Digit of Alarm Setting (0~2) When RTC runs as 12-hour time scale mode, RTC_TIME[21] (the high bit of TENHR[1:0]) means AM/PM indication (If RTC_TIME[21] is 1, it indicates PM time message.)
[19:16]	HR	1-Hour Time Digit of Alarm Setting (0~9)
[15]	Reserved	Reserved.
[14:12]	TENMIN	10-Min Time Digit of Alarm Setting (0~5)
[11:8]	MIN	1-Min Time Digit of Alarm Setting (0~9)
[7]	Reserved	Reserved.
[6:4]	TENSEC	10-Sec Time Digit of Alarm Setting (0~5)
[3:0]	SEC	1-Sec Time Digit of Alarm Setting (0~9)

Note:

1. RTC_TALM is a BCD digit counter.
2. The reasonable value range is listed in the parenthesis.

RTC Calendar Alarm Register (RTC_CALM)

Register	Offset	R/W	Description	Reset Value
RTC_CALM	RTC_BA+0x20	R/W	RTC Calendar Alarm Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
TENYEAR				YEAR			
15	14	13	12	11	10	9	8
Reserved			TENMON	MON			
7	6	5	4	3	2	1	0
Reserved		TENDAY		DAY			

Bits	Description	
[31:24]	Reserved	Reserved.
[23:20]	TENYEAR	10-Year Calendar Digit of Alarm Setting (0~9)
[19:16]	YEAR	1-Year Calendar Digit of Alarm Setting (0~9)
[15:13]	Reserved	Reserved.
[12]	TENMON	10-Month Calendar Digit of Alarm Setting (0~1)
[11:8]	MON	1-Month Calendar Digit of Alarm Setting (0~9)
[7:6]	Reserved	Reserved.
[5:4]	TENDAY	10-Day Calendar Digit of Alarm Setting (0~3)
[3:0]	DAY	1-Day Calendar Digit of Alarm Setting (0~9)

Note:

1. RTC_CALM is a BCD digit counter.
2. The reasonable value range is listed in the parenthesis.

RTC Leap Year Indication Register (RTC_LEAPYEAR)

Register	Offset	R/W	Description	Reset Value
RTC_LEAPYEAR	RTC_BA+0x24	R	RTC Leap Year Indicator Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved

Reserved							
7	6	5	4	3	2	1	0
Reserved					TICK		

Bits	Description	
[31:3]	Reserved	Reserved.
[2:0]	TICK	<p>Time Tick Register</p> <p>These bits are used to select RTC time tick period for Periodic Time Tick Interrupt request.</p> <p>000 = Time tick is 1 second. 001 = Time tick is 1/2 second. 010 = Time tick is 1/4 second. 011 = Time tick is 1/8 second. 100 = Time tick is 1/16 second. 101 = Time tick is 1/32 second. 110 = Time tick is 1/64 second. 111 = Time tick is 1/128 second.</p> <p>Note: If C32KS(RTC_LXTCTL[7]) is 1, the tick period will become 1, 1/3, 1/5, 1/10, 1/19, 1/38, 1/75, 1/150 second. But the 1/3, 1/5, 1/10, 1/19, 1/38 are not uniform output.</p>

RTC Time Alarm MASK Register (RTC_TAMSK)

Register	Offset	R/W	Description	Reset Value
RTC_TAMSK	RTC_BA+0x34	R/W	RTC Time Alarm Mask Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved		MTENHR	MHR	MTENMIN	MMIN	MTENSEC	MSEC

Bits	Description	
[31:6]	Reserved	Reserved.
[5]	MTENHR	Mask 10-Hour Time Digit of Alarm Setting (0~2)
[4]	MHR	Mask 1-Hour Time Digit of Alarm Setting (0~9)
[3]	MTENMIN	Mask 10-Min Time Digit of Alarm Setting (0~5)
[2]	MMIN	Mask 1-Min Time Digit of Alarm Setting (0~9)
[1]	MTENSEC	Mask 10-Sec Time Digit of Alarm Setting (0~5)
[0]	MSEC	Mask 1-Sec Time Digit of Alarm Setting (0~9)

Note:

1. RTC_TALM is a BCD digit counter and RTC will not check loaded data.
2. The reasonable value range is listed in the parenthesis.
3. MTENHR/MHR base on 24 hour Time Scale.

RTC Calendar Alarm MASK Register (RTC_CAMSK)

Register	Offset	R/W	Description	Reset Value
RTC_CAMSK	RTC_BA+0x38	R/W	RTC Calendar Alarm Mask Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved		MTENYEAR	MYEAR	MTENMON	MMON	MTENDAY	MDAY

Bits	Description	
[31:6]	Reserved	Reserved.
[5]	MTENYEAR	Mask 10-Year Calendar Digit of Alarm Setting (0~9)
[4]	MYEAR	Mask 1-Year Calendar Digit of Alarm Setting (0~9)
[3]	MTENMON	Mask 10-Month Calendar Digit of Alarm Setting (0~1)
[2]	MMON	Mask 1-Month Calendar Digit of Alarm Setting (0~9)
[1]	MTENDAY	Mask 10-Day Calendar Digit of Alarm Setting (0~3)
[0]	MDAY	Mask 1-Day Calendar Digit of Alarm Setting (0~9)

Note:

1. RTC_CALM is a BCD digit counter and RTC will not check loaded data.
2. The reasonable value range is listed in the parenthesis.

RTC Spare Functional Control Register (RTC_SPRCTL)

Register	Offset	R/W	Description	Reset Value
RTC_SPRCTL	RTC_BA+0x3C	R/W	RTC Spare Functional Control Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved		SPRCSTS	Reserved		SPRRWEN	Reserved	SPRCLRM

Bits	Description	
[31:6]	Reserved	Reserved.
[5]	SPRCSTS	<p>SPR Clear Flag This bit indicates if the RTC_SPR0 ~RTC_SPR4 content is cleared when specify tamper event is detected.</p> <p>0 = Spare register content is not cleared. 1 = Spare register content is cleared.</p> <p>Note 1: Write 1 to clear this bit. Note 2: This bit keeps 1 when RTC_INTSTS[8] is not equal to 0.</p>
[4:3]	Reserved	Reserved.
[2]	SPRRWEN	<p>Spare Register Enable Bit 0 = Spare register Disabled. 1 = Spare register Enabled.</p> <p>Note: When spare register is disabled, RTC_SPR0 ~ RTC_SPR4 cannot be accessed.</p>
[1]	Reserved	Reserved.
[0]	SPRCLRM	<p>Spare Register Clear Mask Bit 0 = Spare register will be clear after TAMPER occurs. 1 = Spare register will not be clear after TAMPER occurs.</p>

RTC Spare Register (RTC_SPRx)

Register	Offset	R/W	Description	Reset Value

6.11 Basic PWM Generator and Capture Timer (BPWM)

6.11.1 Overview

The chip provides two BPWM generators — BPWM0 and BPWM1 as shown in Figure 6.11-1. Each BPWM supports 6 channels of BPWM output or input capture. There is a 12-bit prescaler to support flexible clock to the 16-bit BPWM counter with 16-bit comparator. The BPWM counter supports up, down and up-down counter types, all 6 channels share one counter. BPWM uses the comparator compared with counter to generate events. These events are used to generate BPWM pulse, interrupt and trigger signal for EADC to start conversion. For BPWM output control unit, it supports polarity output, independent pin mask and tri-state output enable.

The BPWM generator also supports input capture function to latch BPWM counter value to corresponding register when input channel has a rising transition, falling transition or both transition is happened.

6.11.2 Features

6.11.2.1 BPWM Function Features

- Supports maximum clock frequency up to maximum PLL frequency.
- Supports up to two BPWM modules; each module provides 6 output channels
- Supports independent mode for BPWM output/Capture input channel
- Supports 12-bit prescaler from 1 to 4096
- Supports 16-bit resolution BPWM counter; each module provides 1 BPWM counter
 - Up, down and up/down counter operation type
- Supports mask function and tri-state enable for each BPWM pin
- Supports interrupt in the following events:
 - BPWM counter matches 0, period value or compared value
- Supports trigger EADC in the following events:
 - BPWM counter matches 0, period value or compared value

6.11.2.2 Capture Function Features

- Supports up to 12 capture input channels with 16-bit resolution
- Supports rising or falling capture condition
- Supports input rising/falling capture interrupt
- Supports rising/falling capture with counter reload option

6.11.3 Block Diagram

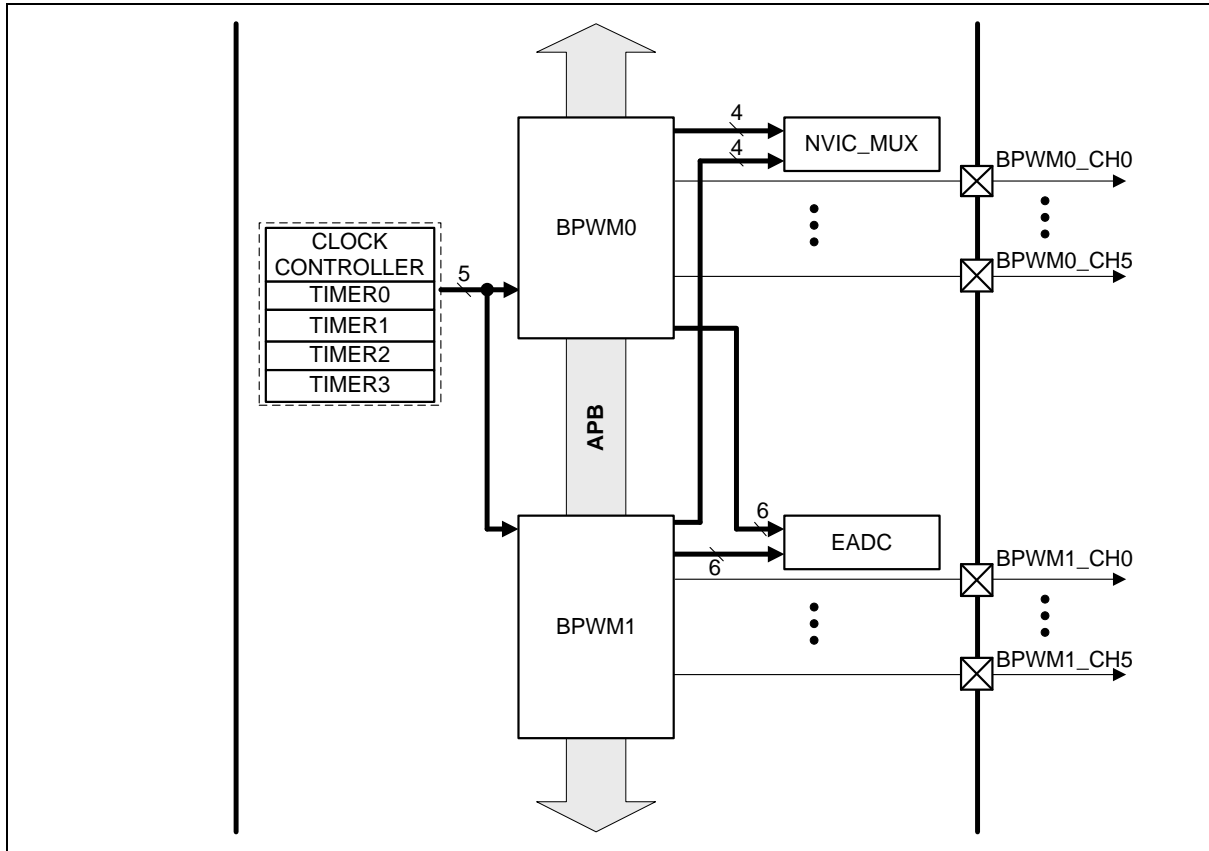

Figure 6.11-1 BPWM Generator Overview Block Diagram

Each BPWM generator has only one clock source inputs and can be selected from BPWM Clock or four TIMER trigger BPWM outputs as shown in Figure 6.11-2 by ECLKSRC0 (BPWM_CLKSRC[2:0]) for BPWM_CLK0. In general case, BPWM0 Clock must be selected from PCLK0 by setting BPWM0SEL (CLK_CLKSEL2[8]) to 1 and BPWM1 Clock from PCLK1 by setting BPWM1SEL (CLK_CLKSEL2[9]) to 1.

When operating in maximum PLL clock frequency as shown in Figure 6.11-3, and Table 6.11-1. BPWM0 and BPWM1 Clock must be selected to PLL clock by setting BPWM0SEL (CLK_CLKSEL2[8]) and BPWM1SEL (CLK_CLKSEL2[9]) to 0.

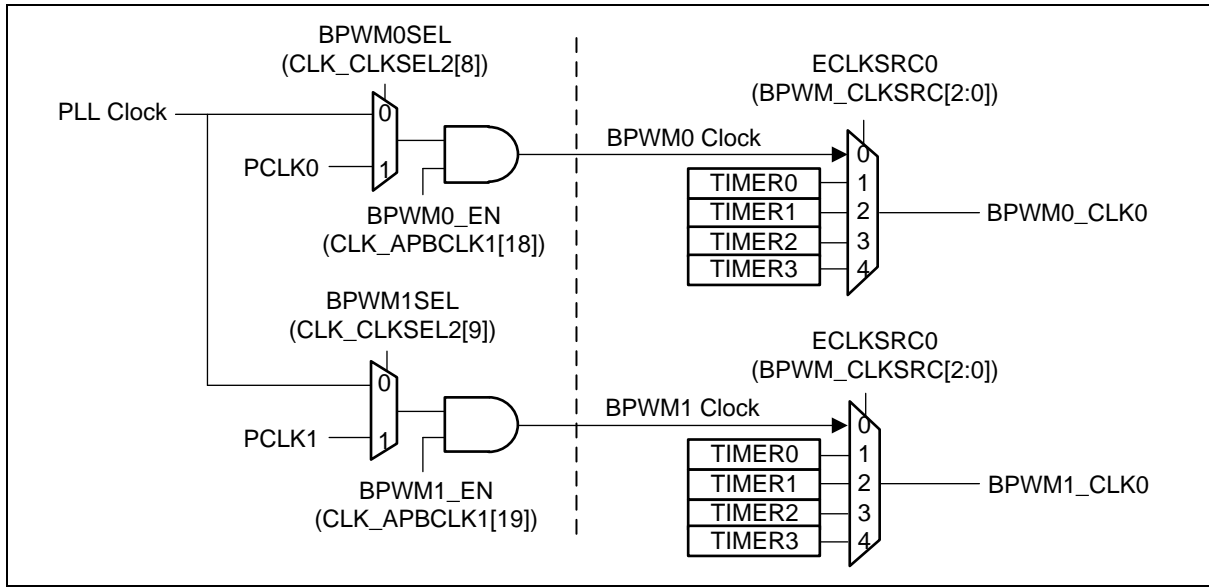

Figure 6.11-2 BPWM Clock Source Control

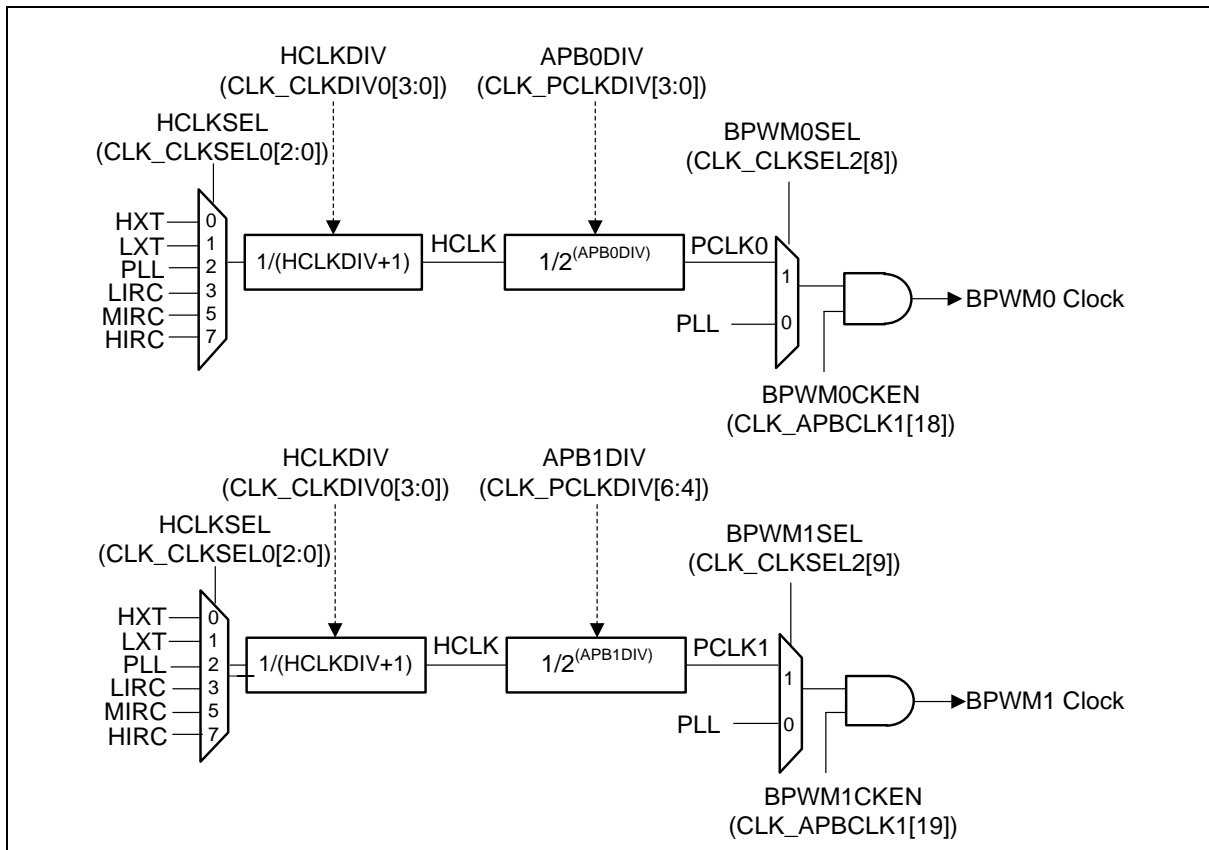

Figure 6.11-3 BPWM Clock Source Control

Table 6.11-1 BPWM Clock Source Control Registers Setting Table

Figure 6.11-4 illustrates the architecture of BPWM Independent mode. All six channels share the same counter. When the counter counts to 0, PERIOD (BPWM_PERIOD[15:0]), or or equal to the comparator, events will be generated. These events are passed to the corresponding generators to generate BPWM pulse, interrupt signal and trigger signal for EADC to start conversion. Output control is used to change the BPWM pulse output state.

6.11.5 Functional Description

6.11.5.1 BPWM Prescaler

The BPWM prescaler is used to divide clock source, prescaler counting CLKPSC +1 times, and the BPWM counter only counts once. The prescale is set by CLKPSC (BPWM_CLKPSC[11:0]). Figure 6.11-5 shows an example of BPWM channel 0 CLKPSC waveform. The prescale counter will reload CLKPSC at the beginning of the next prescale counter down-count.

Figure 6.11-5 BPWM_CH0 CLKPSC Waveform

6.11.5.2 BPWM Counter

BPWM has one counter, and supports 3 counter types operation: Up Counter, Down Counter and Up-Down Counter types.

For BPWM channel0, CNT(BPWM_CNT[15:0]) can clear to 0x00 by CNTCLR0 (BPWM_CNTCLR[0]) when the prescale counter counts down to 0, and CNTCLR0(BPWM_CNTCLR[0]) will be set as 0 by hardware automatically.

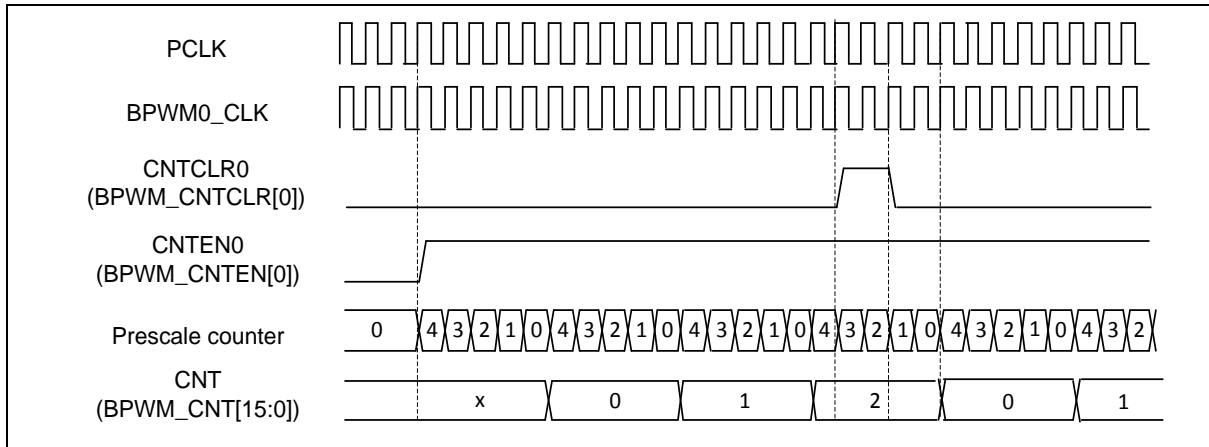

Figure 6.11-6 BPWM Counter Clear Waveform

6.11.5.3 Up Counter Type

In the up counter operation, the 16 bits BPWM counter is an up counter and starts up-counting from 0 to PERIOD (BPWM_PERIOD) to finish a BPWM period. The current counter value can be found by reading the CNT (BPWM_CNT[15:0]). BPWM generates zero point event when the counter counts to 0 and generates period point event when counting to PERIOD. An example of the period time in up counter type, the BPWM period time = (PERIOD+1) * (CLKPSC+1) * BPWMx_CLK clock time, is shown in Figure 6.11-7.

Figure 6.11-7 BPWM Up Counter Type

6.11.5.4 Down Counter Type

In the down counter operation, the 16 bits BPWM counter is a down counter and starts down-counting from PERIOD to 0 to finish a BPWM period. The current counter value can be found by reading the CNT. BPWM generates zero point event when the counter counts to 0 and generates period point event when counting to PERIOD. An example of the period time in down counter type, the BPWM period time = (PERIOD+1) * (CLKPSC+1) * BPWMx_CLK clock time, is shown in Figure 6.11-8.

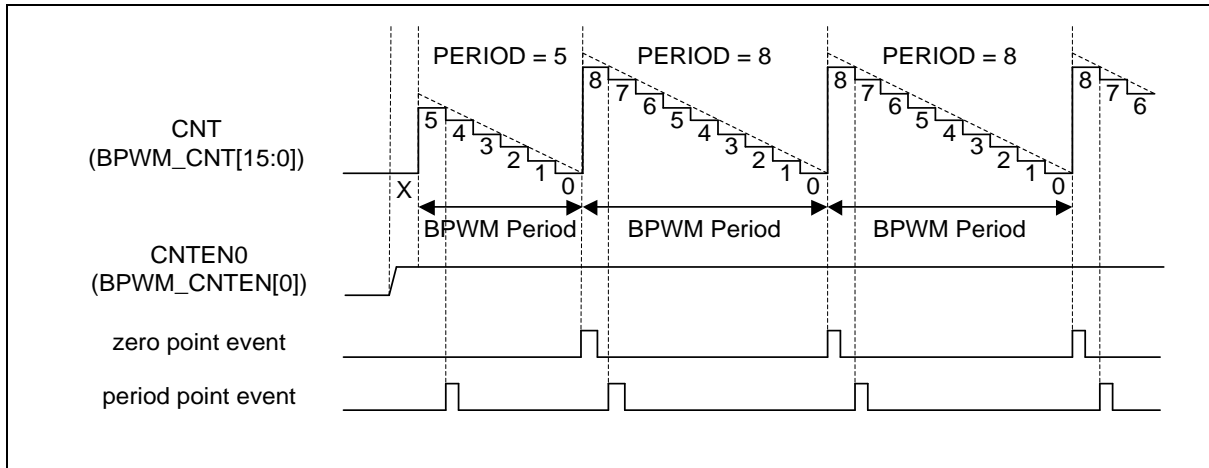

Figure 6.11-8 BPWM Down Counter Type

6.11.5.5 Up-Down Counter Type

In the up-down counter operation, the 16 bits BPWM counter is an up-down counter and starts counting-up from 0 to PERIOD and then starts counting down to 0 to finish a BPWM period. The current counter value can be found by reading the CNT. BPWM generates zero point event when counter counts to 0 and generates center point event when counting to PERIOD. An example of the period time in up-down counter type, the BPWM period time = $(2 \times \text{PERIOD}) \times (\text{CLKPSC} + 1) \times \text{BPWMx_CLK}$ clock time, is shown in Figure 6.11-9. The DIRF (BPWM_CNT[16]) is a counter direction indicator flag, where high is up counting, and low is down counting.

Note: In up-down count type, period interrupt flag occurs at center point event.

Figure 6.11-9 BPWM Up-Down Counter Type

6.11.5.6 BPWM Comparator

The CMPDAT (BPWM_CMPDATn[15:0]) is a basic comparator register of BPWM channel n; each channel only has one CMPDAT. The CMPDAT's value is continuously compared to the counter value. When the counter is equal to the compared register, BPWM generates an event and uses the event to generate BPWM pulse, interrupt or use to trigger EADC. In up-down counter type, two events will be

generated in a BPWM period as shown in Figure 6.11-10.

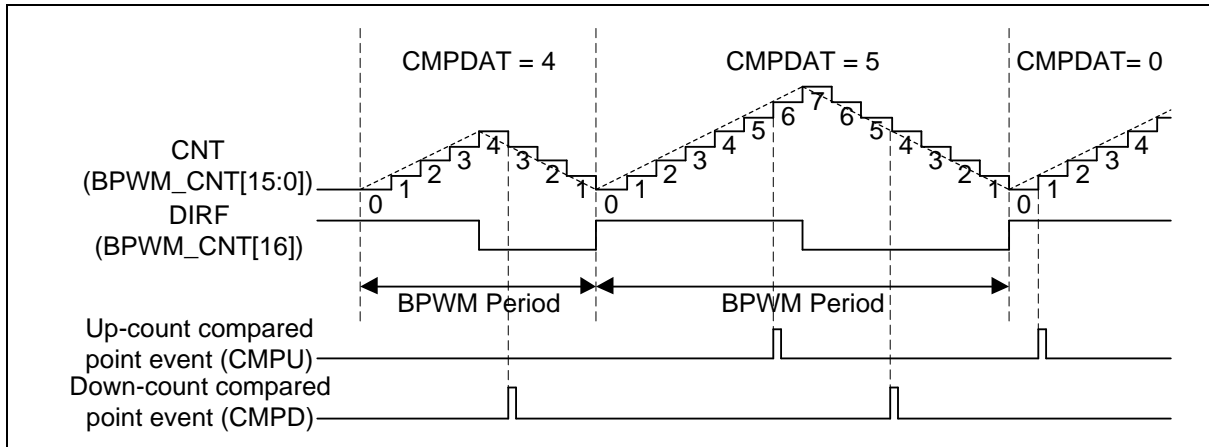

Figure 6.11-10 BPWM CMPDAT Events in Up-Down Counter Type

6.11.5.7 Period Loading Mode

Period Loading mode is the default loading mode. It has lowest priority in loading modes. PERIOD and CMPDAT will both load to their buffer while a period is completed. For example, after BPWM counter up counts from 0 to PERIOD in up-counter operation or down counts from PERIOD to 0 in the down-counter operation or up counts from 0 to PERIOD and then down counts to 0 in up-down counter operation.

Figure 6.11-11 shows period loading timing of up-count operation, where PERIOD DATA0 denotes the initial data of PERIOD, PERIOD DATA1 denotes the first updated PERIOD data by software and so on, CMPDAT also follows this rule. The following describes steps sequence of Figure 6.11-11. User can know the PERIOD and CMPDAT update condition, by watching BPWM period and CMPU event.

1. Software writes CMPDAT DATA1 to CMPDAT at point 1.
2. Hardware loads CMPDAT DATA1 to CMPBUF at the end of PWM period at point 2.
3. Software writes PERIOD DATA1 to PERIOD at point 3.
4. Hardware loads PERIOD DATA1 to PBUF at the end of PWM period at point 4.
5. Software writes PERIOD DATA2 to PERIOD at point 5.
6. Hardware loads PERIOD DATA2 to PBUF at the end of PWM period at point 6.

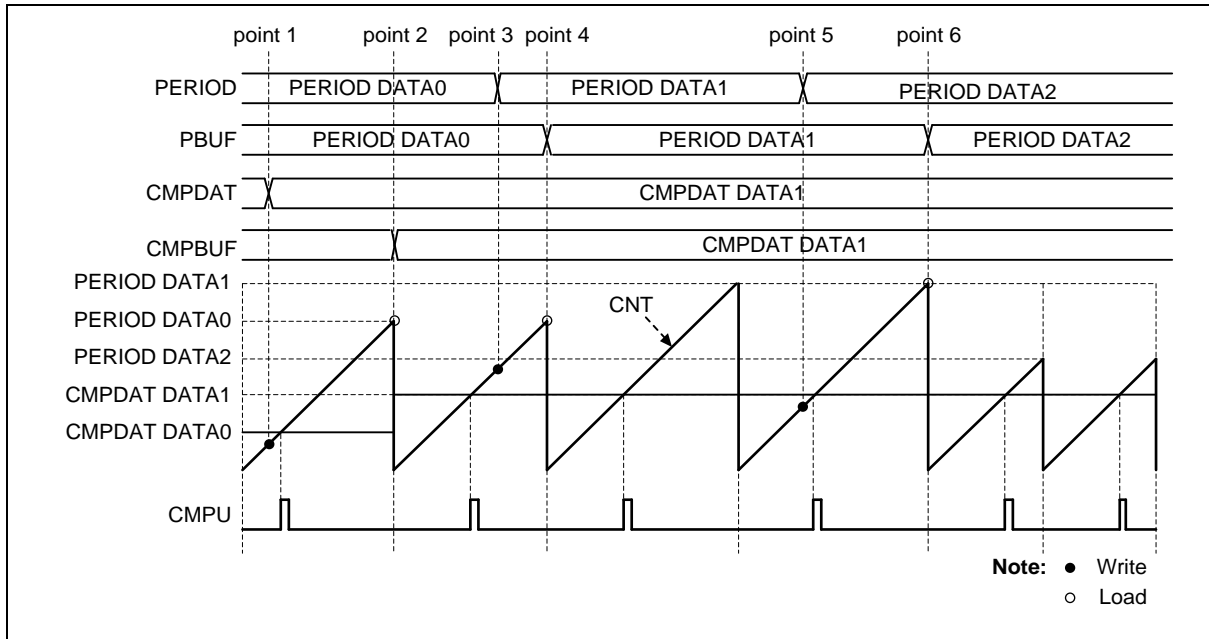

Figure 6.11-11 Period Loading Mode with Up-Counter Type

6.11.5.8 Immediately Loading Mode

If the IMMLDENn (BPWM_CTL0[21:16]) bit which corresponds to BPWM channel n is set to 1, software will load a value to buffer from PERIOD and CMPDAT immediately while software updates PERIOD or CMPDAT. If the update PERIOD value is less than current counter value, counter will count to 0xFFFF, when counter count to 0xFFFF and prescale count to 0, the flag CNTMAX0(BPWM_STATUS[0]) will raise, and then counter will count wraparound. Immediately loading mode has the highest priority. If IMMLDENn has been set, other loading mode for channel n will become invalid. Figure 6.11-12 shows an example and its steps sequence is described below.

1. Software writes CMPDAT DATA1 and hardware immediately loads CMPDAT DATA1 to CMPBUF at point 1.
2. Software writes PERIOD DATA1 which is greater than the current counter value at point 2; counter will continue counting until it is equal to PERIOD DATA1 to finish a period loading.
3. Software writes PERIOD DATA2 which is less than the current counter value at point 3; counter will continue counting to its maximum value 0xFFFF and count wraparound from 0 to PERIOD DATA2 to finish this period loading.

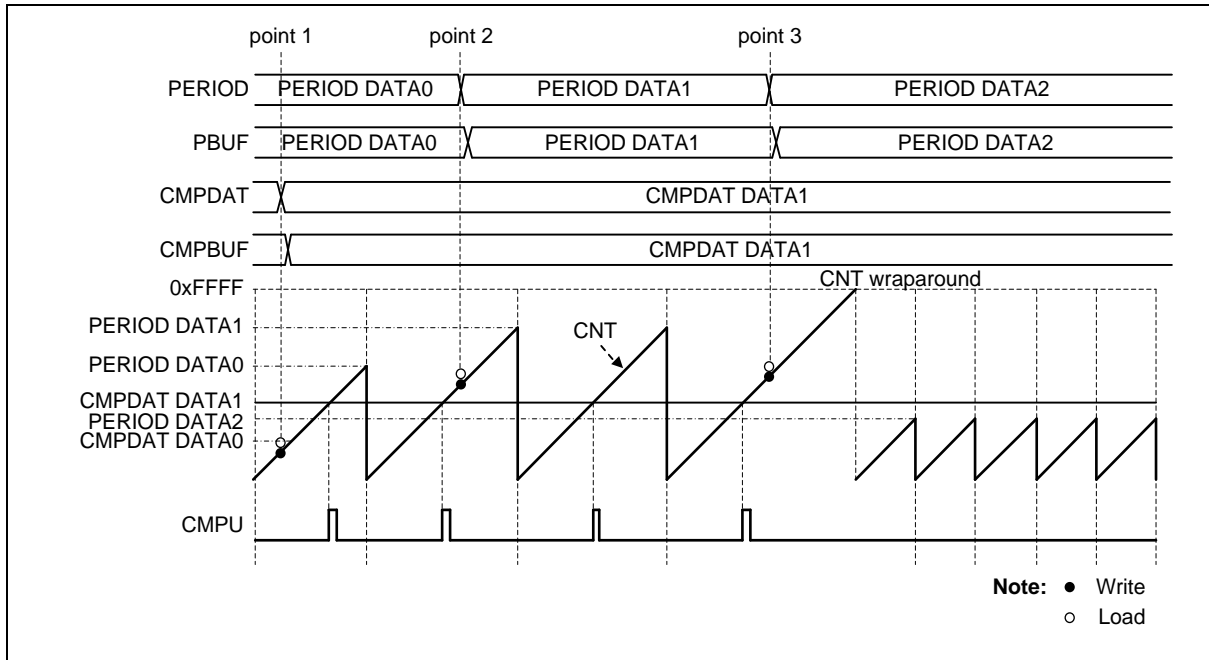

Figure 6.11-12 Immediately Loading Mode with Up-Counter Type

6.11.5.9 Center Loading Mode

If the CTRLDN (BPWM_CTL0[5:0]) bit which corresponds to BPWM channel n is set to 1 and in up-down counter type, CMPDAT will load to CMPBUF_n in center of a period, that is, counter counts to PERIOD. PERIOD loading timing is the same as period loading mode. Figure 6.11-13 shows an example and its steps sequence is described below.

1. Software writes CMPDAT DATA1 at point 1.
2. Hardware loads CMPDAT DATA1 to CMPBUF at center of PWM period at point 2.
3. Software writes PERIOD DATA1 at point 3.
4. Hardware loads PERIOD DATA1 to PBUF at the end of PWM period at point 4.
5. Software writes CMPDAT DATA2 at point 5.
6. Hardware loads CMPDAT DATA2 to CMPBUF at center of PWM period at point 6.
7. Software writes PERIOD DATA2 at point 7.
8. Hardware loads PERIOD DATA2 to PBUF at the end of PWM period at point 8.

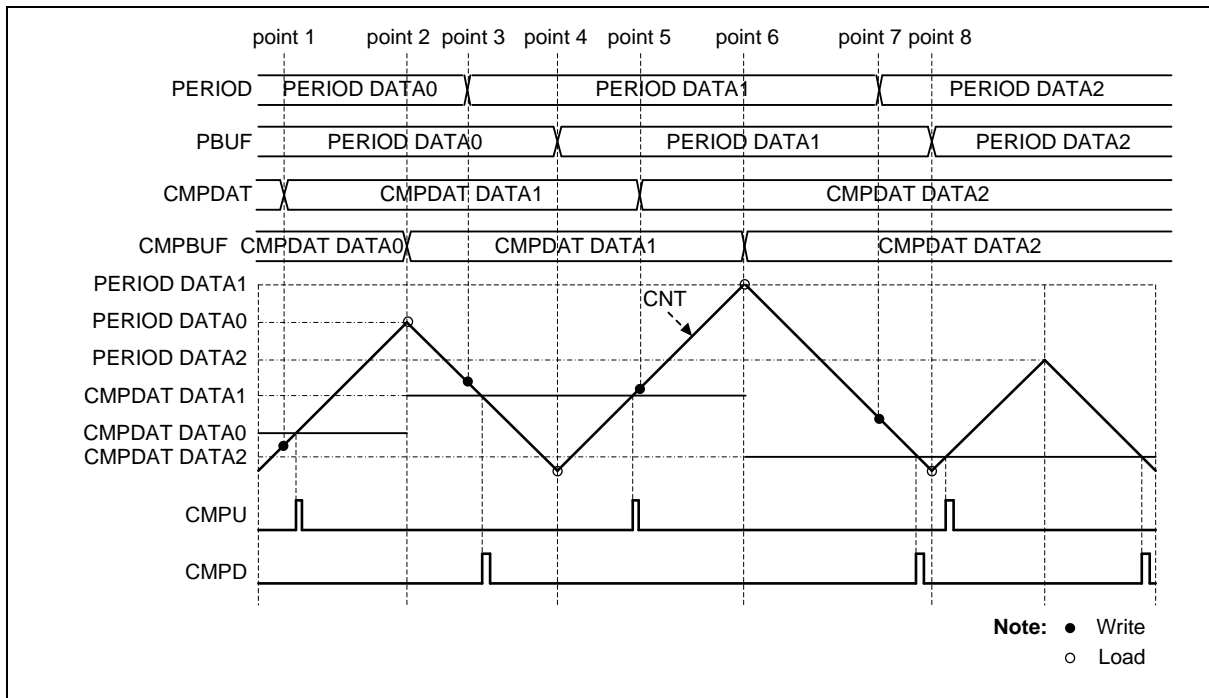

Figure 6.11-13 Center Loading Mode with Up-Down-Counter Type

6.11.5.10 BPWM Pulse Generator

The BPWM pulse generator uses counter and comparator events to generate BPWM pulse. The events are: zero point, period point in up counter type and down counter type, center point in up-down counter type and counter equal to comparator point in three types. As to up-down counter type, there are two counter equal comparator points, one at up count another at down count.

Each event point can decide BPWM waveform to do nothing (X), set Low (L), set High (H) or toggle (T) by setting BPWM_WGCTL0 and BPWM_WGCTL1 registers. Using these points can easily generate asymmetric BPWM pulse or variant waveform as shown in Figure 6.11-14. In the figure, there is a comparator n to generate BPWM pulse, where n denotes channel number 0 to 5. CMPU denotes CNT is equal to CMPDAT when counting up, and CMPD denotes CNT is equal to CMPDAT when counting down.

Figure 6.11-14 BPWM Pulse Generation (Left: Asymmetric Pulse, Right: Variety Pulse)

The generation events may be sometimes set to the same value, as the reason, events priority between different counter types are list below, up counter type (Table 6.11-2) down counter type (Table 6.11-3) and up-down counter type (Table 6.11-4). By using event priority, user can easily generate 0% to 100% duty pulse as shown in Figure 6.11-15.

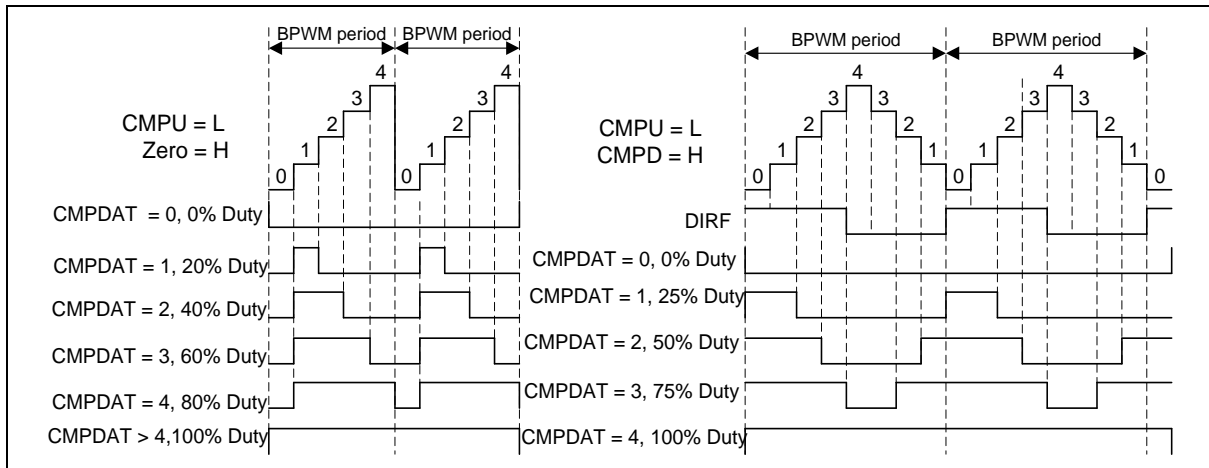

Figure 6.11-15 BPWM 0% to 100% Pulse Generation (Left: Up Counter Type, Right: Up-down Counter Type)

Priority	Up Event
1 (Highest)	Period event (CNT = PERIOD)
2	Compare up event(CNT = CMPUn)
3 (Lowest)	Zero event (CNT = 0)

Table 6.11-2 BPWM Pulse Generation Event Priority for Up-Counter

Priority	Down Event
1 (Highest)	Zero event (CNT = 0)

2	Compare down event (CNT = CMPDn)
3 (Lowest)	Period event (CNT = PERIOD)

Table 6.11-3 BPWM Pulse Generation Event Priority for Down-Counter

Priority	Up Event	Down Event
1 (Highest)	Compare up event (CNT = CMPUn)	Compare down event (CNT = CMPDn)
2 (Lowest)	Zero event (CNT = 0)	Period (center) event (CNT =PERIOD)

Table 6.11-4 BPWM Pulse Generation Event Priority for Up-Down-Counter

6.11.5.11 Synchronous function

To start BPWM and PWM counters in the same time, user has to set the BPWM Synchronous Start Control Register (BPWM_SSCTL[0]) to enable the channel counters which are planned to start counting together, and select the SSRC(BPWM_SSCTL[9:8]) to choose the Synchronous Start source, followed by setting the BPWM Synchronous Start Trigger Register CNTSEN (BPWM_SSTRG[0]).

6.11.5.12 BPWM Output Control

After BPWM pulse generation, there are three steps to control the output of BPWM channels. There are Mask, Pin Polarity and Output Enable three steps as shown in Figure 6.11-16.

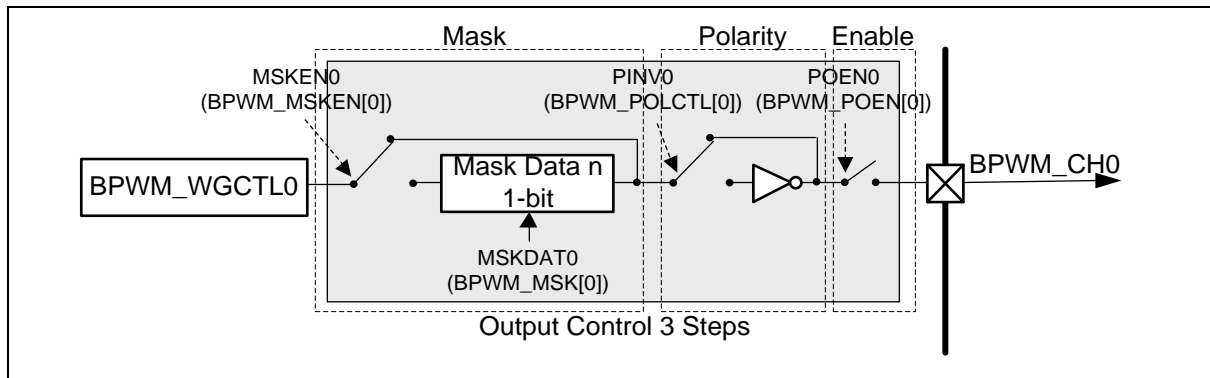

Figure 6.11-16 BPWM_CH0 Output Control 3 Steps

6.11.5.13 BPWM Mask Output Function

Each of the BPWM output channels can be manually overridden by using the appropriate bits in the BPWM Mask Enable Control Register (BPWM_MSKEN) and BPWM Masked Data Register (BPWM_MSK) to drive the BPWM channel outputs to specified logic states independent of the duty cycle comparison units. The BPWM mask bits are useful when controlling various types of Electrically Commutated Motor (ECM) like a BLDC motor. The BPWM_MSKEN register contains six bits, MSKENn(BPWM_MSKEN[5:0]) determine which BPWM channel output will be overridden, MSKENn(BPWM_MSKEN[5:0]) bits are active-high. The BPWM_MSK register contains six bits, MSKDATn(BPWM_MSK[5:0]), which determine the state of the BPWM channel output when the channel is masked via the MSKDAT bits. Figure 6.11-17 shows an example of how BPWM mask control can be used for the override feature.

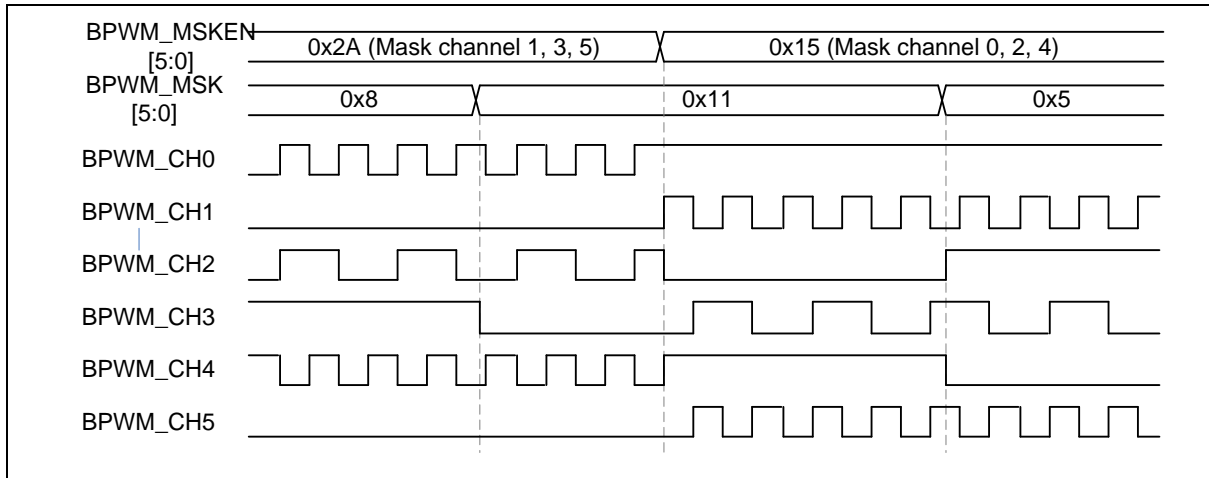

Figure 6.11-17 Mask Control Waveform Illustration

6.11.5.14 Polarity Control

Each BPWM port from BPWM_CH0 to BPWM_CH5 has an independent polarity control module to configure the polarity of the active state of BPWM output. By default, the BPWM output is active high. This implies the BPWM OFF state is low and ON state is high. This definition is variable through setting BPWM Negative Polarity Control Register (BPWM_POLCTL), for each individual BPWM channel. Figure 6.11-18 shows the initial state before BPWM starts with different polarity settings.

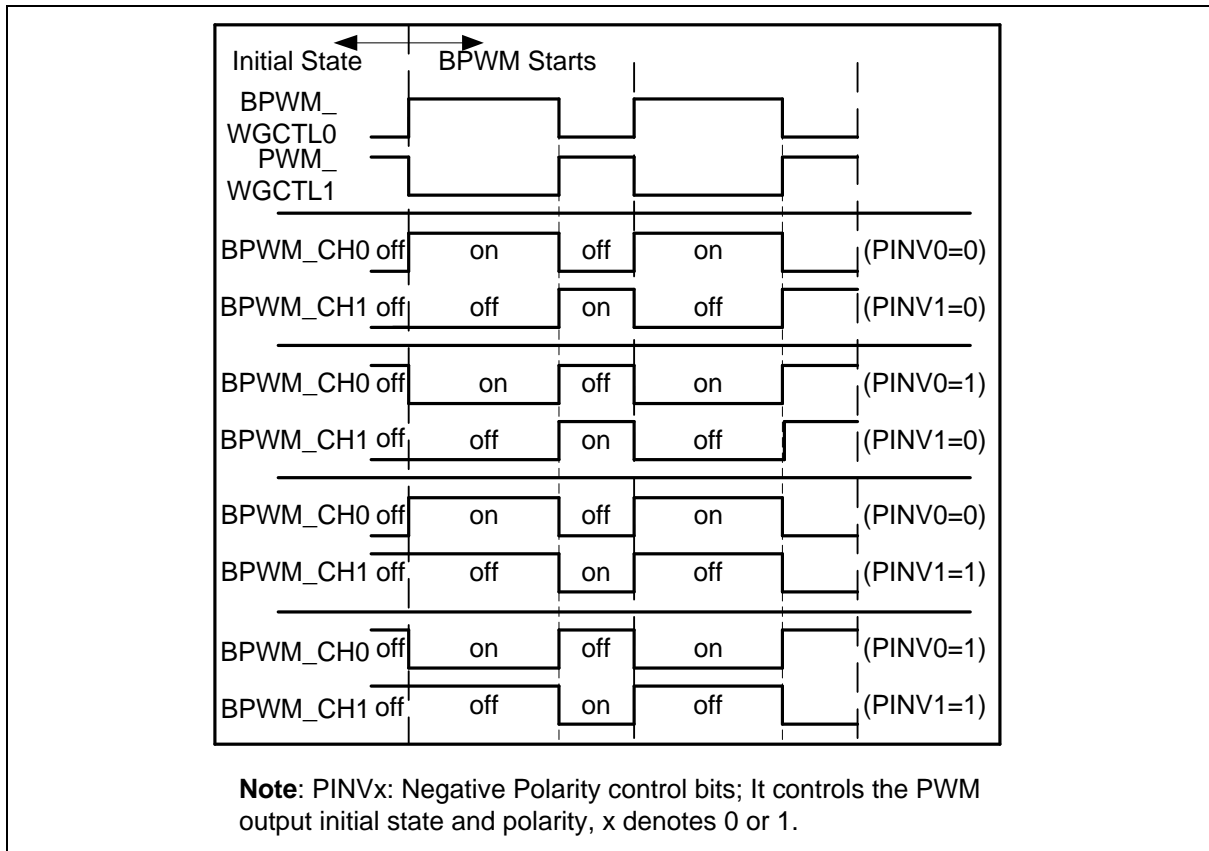

Figure 6.11-18 Initial State and Polarity Control

6.11.5.15 BPWM Interrupt Generator

There are two independent interrupts for each BPWM as shown in Figure 6.11-19.

BPWM interrupt (BPWM_INT) comes from BPWM complementary pair events. The counter can generate the Zero point Interrupt Flag ZIF0 (BPWM_INTSTS0[0]) and the Period point Interrupt Flag PIF0 (BPWM_INTSTS0[8]). When BPWM channel n's counter equals to the comparator value stored in BPWM_CMPDATn, the different interrupt flags will be triggered depending on the counting direction. If the matching occurs at up-count direction, the Up Interrupt Flag CMPUIFn (BPWM_INTSTS0[21:16]) is set and if matching at the opposite direction, the Down Interrupt Flag CMPDIFn (BPWM_INTSTS0[29:24]) is set. If the correspond interrupt enable bits are set, the trigger events will generates interrupt signals.

Another interrupt is the capture interrupt (CAP_INT). It shares the BPWM_INT vector in NVIC, CAP_INT can be generated when the CAPRIFn (BPWM_CAPIF[5:0]) is triggered and the Capture Rising Interrupt Enable bit CAPRIENn (BPWM_CAPIEN[5:0]) is set to 1. Or in the falling edge condition, the CAPFIIn (BPWM_CAPIF[13:8]) can be triggered when the Capture Falling Interrupt Enable bit CAPFIENn (BPWM_CAPIEN[13:8]) is set to 1.

Figure 6.11-19 demonstrates the architecture of the BPWM interrupts.

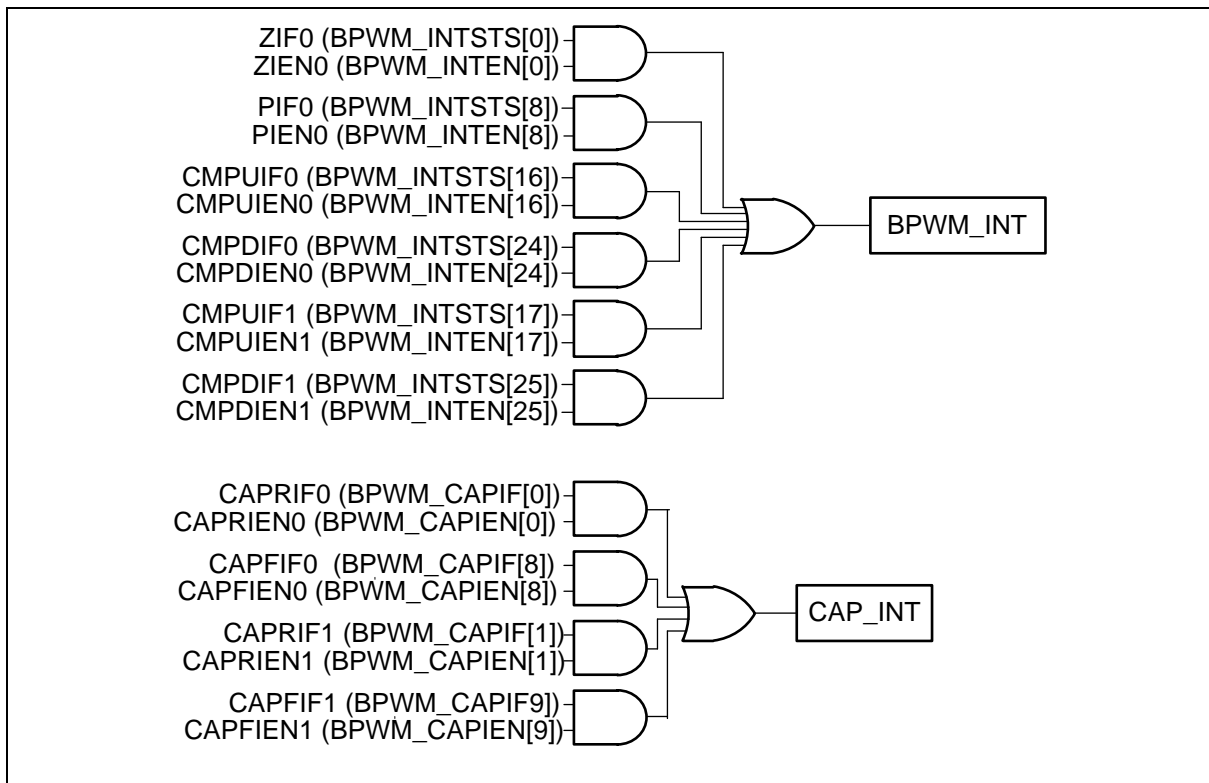

Figure 6.11-19 BPWM_CH0 and BPWM_CH1 Pair Interrupt Architecture Diagram

6.11.5.16 BPWM Trigger EADC Generator

BPWM can be one of the EADC conversion trigger source. Each BPWM pair channels share the same trigger source. Setting TRGSELn is to select the trigger sources, where TRGSELn is TRGSEL0, TRGSEL1, ..., and TRGSEL5, which are located in BPWM_EADCTS0[3:0], BPWM_EADCTS0[11:8], BPWM_EADCTS0[19:16], BPWM_EADCTS0[27:24], BPWM_EADCTS1[3:0] and BPWM_EADCTS1[11:8], respectively. Setting TRGENn is to enable the trigger output to EADC, where TRGENn is TRGEN0, TRGEN1, ..., TRGEN5, which are located in BPWM_EADCTS0[7], BPWM_EADCTS0[15], BPWM_EADCTS0[23], BPWM_EADCTS0[31], BPWM_EADCTS1[7] and BPWM_EADCTS1[15], respectively. The number n (n = 0, 1, ..., 5) denotes BPWM channel number.

There are 7 BPWM events can be selected as the trigger source for one pair of channels. Figure 6.11-20 is an example of BPWM_CH0 and BPWM_CH1. BPWM can trigger EADC to start conversion in different timings by setting PERIOD and CMPDAT. Figure 6.11-22 is the trigger EADC timing waveform in the up-down counter type.

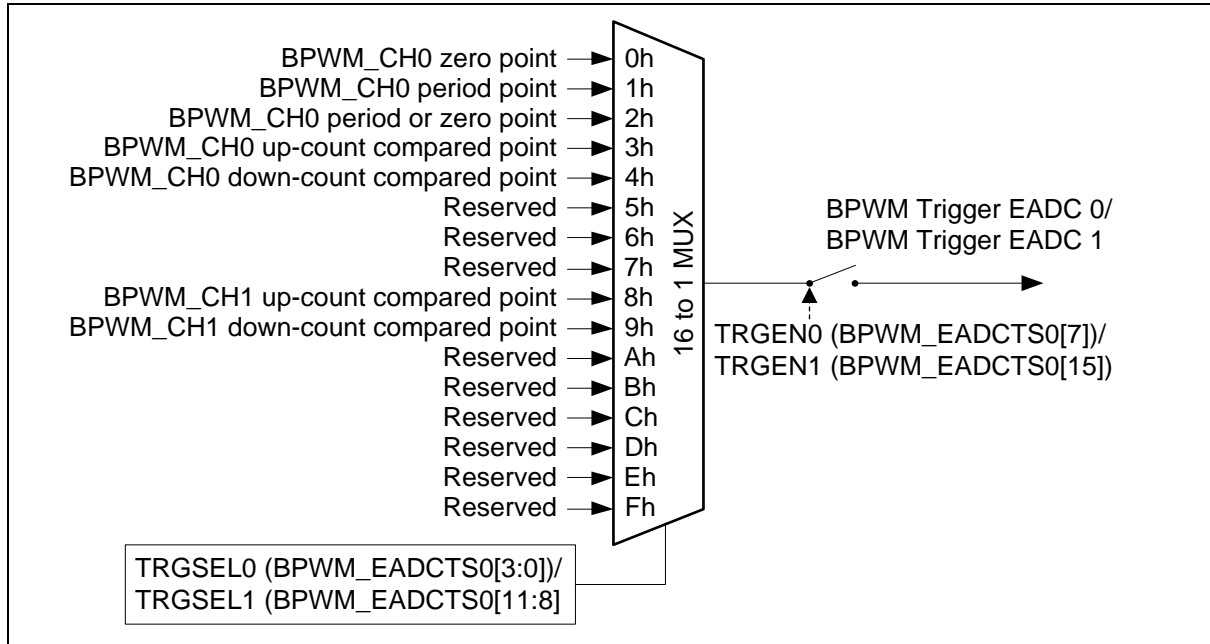

Figure 6.11-20 BPWM_CH0 and BPWM_CH1 Pair Trigger EADC Source Block Diagram

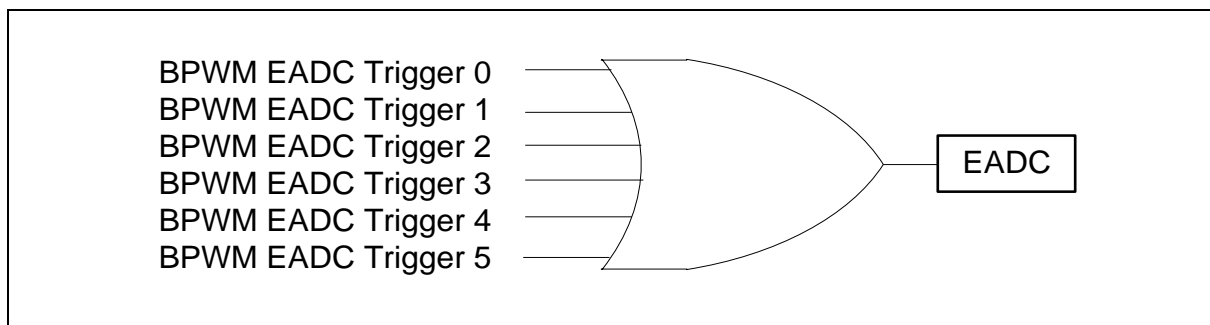

Figure 6.11-21 BPWM CH0~ CH5 Trigger EADC Block Diagram

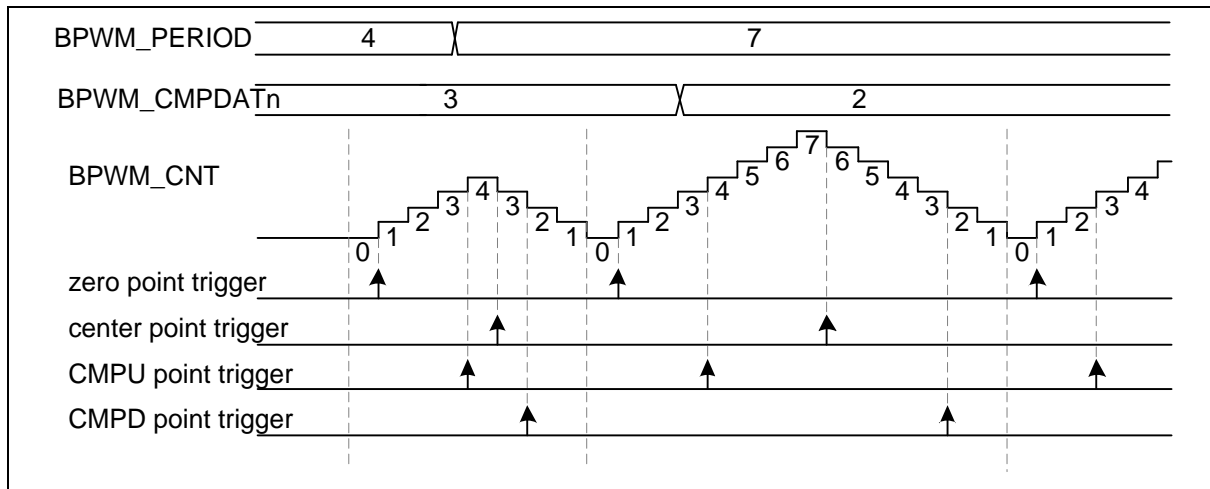

Figure 6.11-22 BPWM Trigger EADC in Up-Down Counter Type Timing Waveform

6.11.5.17 Capture Operation

The channels of the capture input and the BPWM output share the same pin and counter. The counter can operate in up or down counter type. The capture function will always latch the BPWM counter to the register RCAPDATn (BPWM_RCAPDATn[15:0]) or the register FCAPDATn (BPWM_FCAPDATn[15:0]) if the input channel has a rising transition or a falling transition, respectively. The capture function will also generate an interrupt CAP_INT (using BPWM_INT vector) if the rising or falling latch occurs and the corresponding channel n's rising or falling interrupt enable bits are set, where the CAPRIENn (BPWM_CAPIEN[5:0]) is for the rising edge and the CAPFIENn (BPWM_CAPIEN[13:8]) is for the falling edge. When rising or falling latch occurs, the corresponding BPWM counter may be reloaded with the value BPWM_PERIOD, depending on the setting of RCRLDENn or FCRLDENn (where RCRLDENn and FCRLDENn are located at BPWM_CAPCTL[21:16] and BPWM_CAPCTL[29:24], respectively). Note that the corresponding GPIO pins must be configured as the capture function by enable the CAPINENn (BPWM_CAPINEN[5:0]) for the corresponding capture channel n. Figure 6.11-23 is the capture block diagram of channel 0.

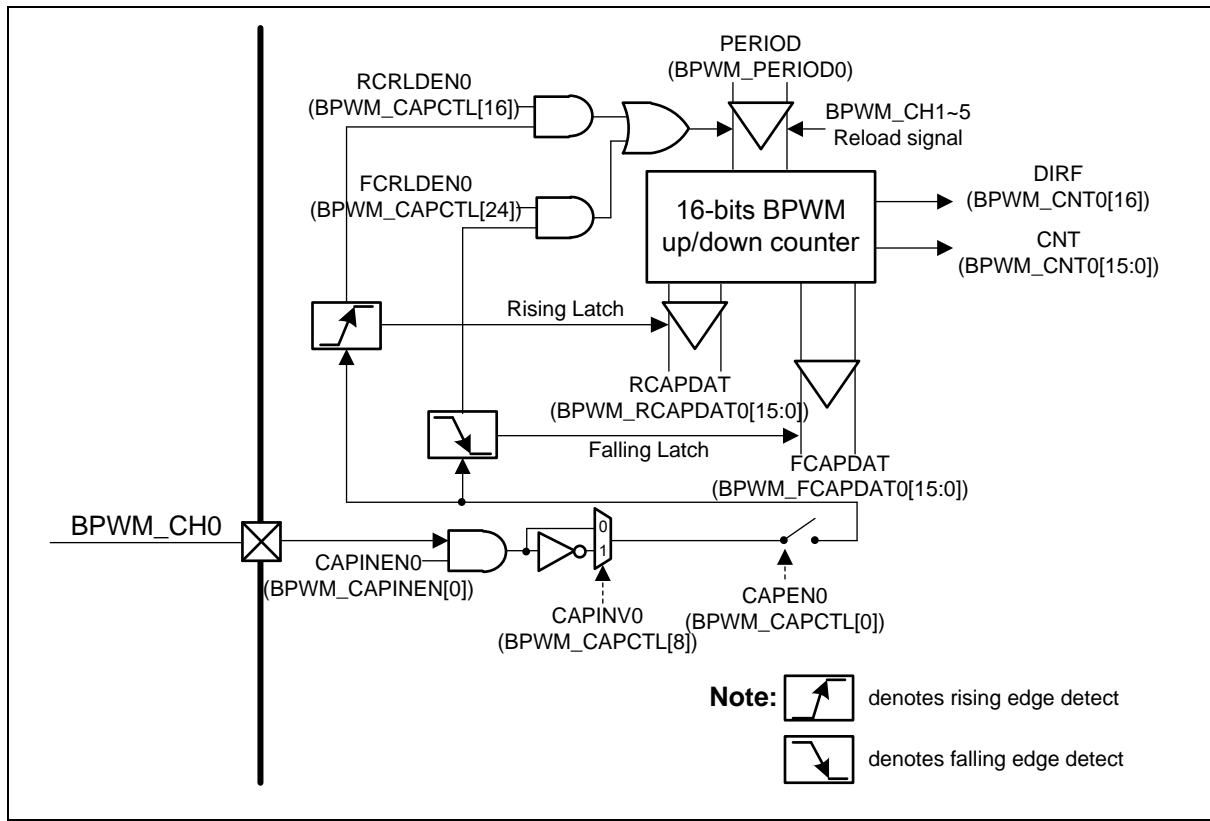

Figure 6.11-23 BPWM_CH0 Capture Block Diagram

Figure 6.11-24 illustrates the capture function timing. In this case, the capture counter is set as BPWM down counter type and the PERIOD is set to 8 so that the counter counts in the down direction, from 8 to 0. When detecting a falling edge at the capture input pin, the capture function latches counter value to the BPWM_FCAPDATn. When detecting the rising edge, it latches the counter value to the BPWM_RCAPDATn. In this timing diagram, when the falling edge is detected at the first time, the capture function will reload the counter value from the PERIOD setting because the FCRLDENn is enabled. But at the second time, the falling edge does not result in a reload because of the disabled FCRLDENn. In this example, the counter also reloads at the rising edge of the capture input because the RCRLDENn is enabled, too.

Moreover, if the case is setup as the up counter type, the counter will reload the value zero and count up to the value PERIOD. It is important that the counter is shared by all channels, so the counter reloads time also controlled by all channels' reload signals.

Figure 6.11-24 also illustrates the timing example for the interrupt and interrupt flag generation. When the rising edge at channel n is detected, the corresponding bit CAPRIFn (BPWM_CAPIF[5:0]) is set by hardware. Similarly, a falling edge detection at channel n causes the corresponding bit CAPFIFn (BPWM_CAPIF[13:8]) set by hardware. CAPRIFn (BPWM_CAPIF[5:0]) and CAPFIFn (BPWM_CAPIF[13:8]) can be cleared by software by writing '1'. If the CAPRIFn (BPWM_CAPIF[5:0]) is set and the CAPRIENn is enabled, the capture function generates an interrupt. If the CAPFIFn (BPWM_CAPIF[13:8]) is set and the CAPFIENn is enabled, the interrupt also happens.

A condition which is not shown in this figure is: if the rising latch happens again when the CAPRIFn (BPWM_CAPIF[5:0]) is already set, the Over run status CRIFOVn (BPWM_CAPSTS[5:0]) will be set to 1 by hardware to indicate the CAPRIFn (BPWM_CAPIF[5:0]) overrunning. Also, if the falling latch happens again, the same hardware operation occurs for the interrupt flag CAPFIF n (BPWM_CAPIF[13:8]) and the Over run status CFIFOVn (BPWM_CAPSTS[13:8]).

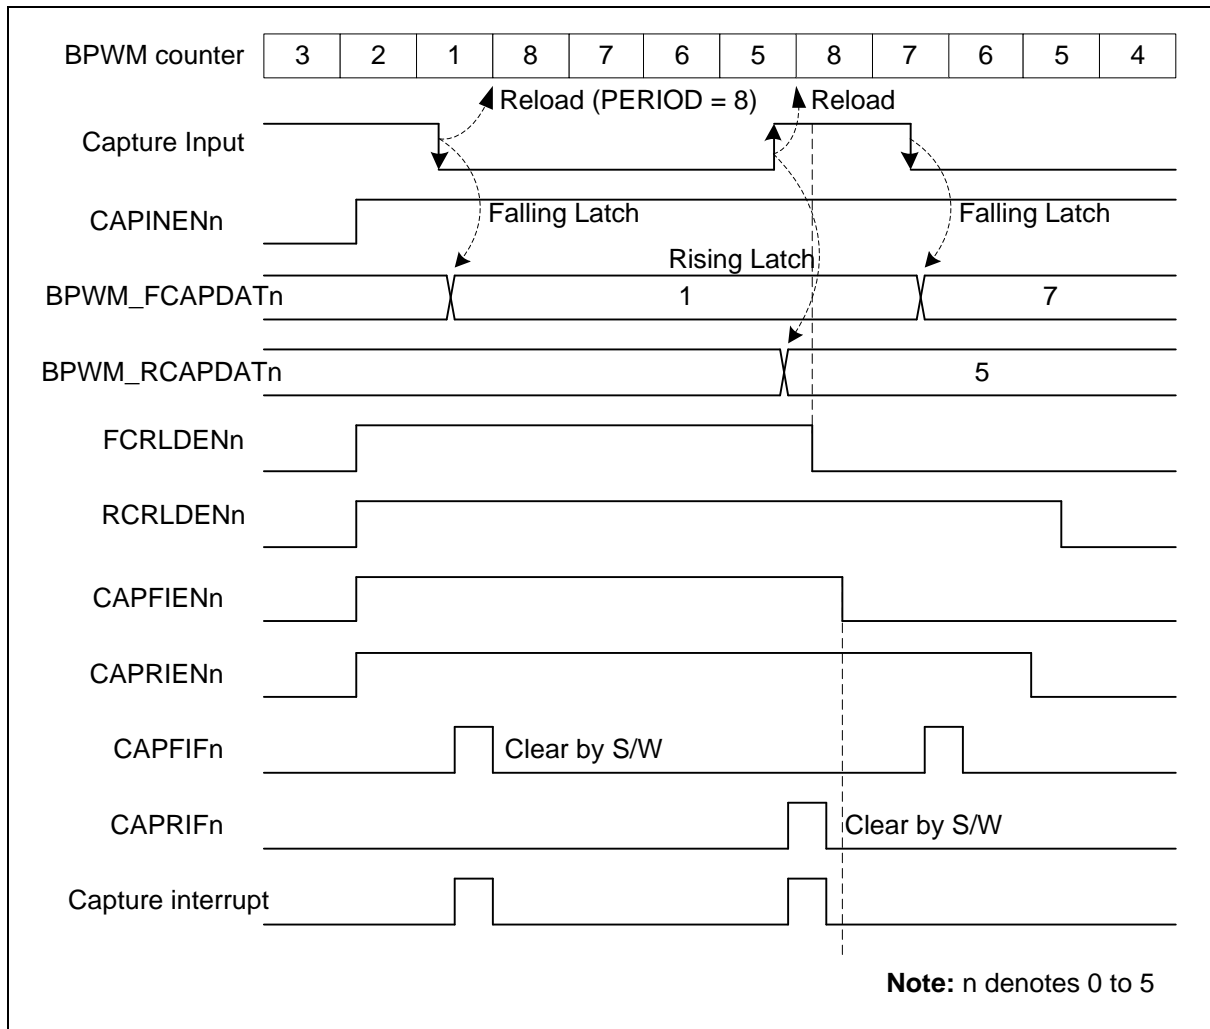

Figure 6.11-24 Capture Operation Waveform

The capture pulse width meeting the following conditions can be calculated according to the formula.

1. The capture positive or negative pulse width is shorter than a counter period.
2. The counter operates in down counter type.
3. The counter can be reloaded by both falling and rising capture events through setting FCRLDENn and RCRLDENn bits of PWM_CAPCTL register to 1.

For the negative pulse case, the channel low pulse width is calculated as $(BPWM_PERIOD + 1 - BPWM_RCAPDATn)$ BPWM counter time, where one BPWM counter time is $(CLKPSC+1) * BPWMx_CLK$ clock time. In the case shown in Figure 6.11-24, low pulse width is $8+1-5 = 4$ BPWM counter time.

For the positive pulse case, the channel high pulse width is calculated as $(BPWM_PERIOD + 1 - BPWM_FCAPDATn)$ BPWM counter time, where one BPWM counter time is $(CLKPSC+1) * BPWMx_CLK$ clock time. In the case shown in Figure 6.11-24, high pulse width is $8+1-7 = 2$ BPWM counter time.

6.12 PWM Generator and Capture Timer (PWM)

6.12.1 Overview

The chip provides two PWM generators — PWM0 and PWM1. Each PWM supports 6 channels of PWM output or input capture. There is a 12-bit prescaler to support flexible clock to the 16-bit PWM counter with 16-bit comparator. The PWM counter supports up, down and up-down counter types. PWM uses comparator compared with counter to generate events. These events use to generate PWM pulse, interrupt and trigger signal for ADC to start conversion.

The PWM generator supports two standard PWM output modes: Independent mode and Complementary mode, they have difference architecture. In Complementary mode, there are two comparators to generate various PWM pulse with 12-bit dead-time generator. For PWM output control unit, it supports polarity output, independent pin mask and brake functions.

The PWM generator also supports input capture function to latch PWM counter value to the corresponding register when input channel has a rising transition, falling transition or both transition is happened. Capture function also support PDMA to transfer captured data to memory.

6.12.2 Features

6.12.2.1 PWM function features

- Supports maximum clock frequency up to maximum PLL frequency
- Supports up to two PWM modules, each module provides 6 output channels
- Supports independent mode for PWM output/Capture input channel
- Supports complementary mode for 3 complementary paired PWM output channel
 - Dead-time insertion with 12-bit resolution
 - Two compared values during one period
- Supports 12-bit prescaler from 1 to 4096
- Supports 16-bit resolution PWM counter
 - Up, down and up/down counter operation type
- Supports mask function and tri-state enable for each PWM pin
- Supports brake function
 - Brake source from pin and system safety events (clock failed, Brown-out detection and CPU lockup)
 - Noise filter for brake source from pin
 - Edge detect brake source to control brake state until brake interrupt cleared
 - Level detect brake source to auto recover function after brake condition removed
- Supports interrupt on the following events:
 - PWM counter matches 0, period value or compared value
 - Brake condition happened
- Supports trigger ADC on the following events:
 - PWM counter matches 0, period value or compared value

6.12.2.2 Capture Function Features

- Supports up to 12 capture input channels with 16-bit resolution

- Supports rising or falling capture condition
- Supports input rising/falling capture interrupt
- Supports rising/falling capture with counter reload option
- Supports PDMA transfer function for PWM all channels

6.12.3 Block Diagram

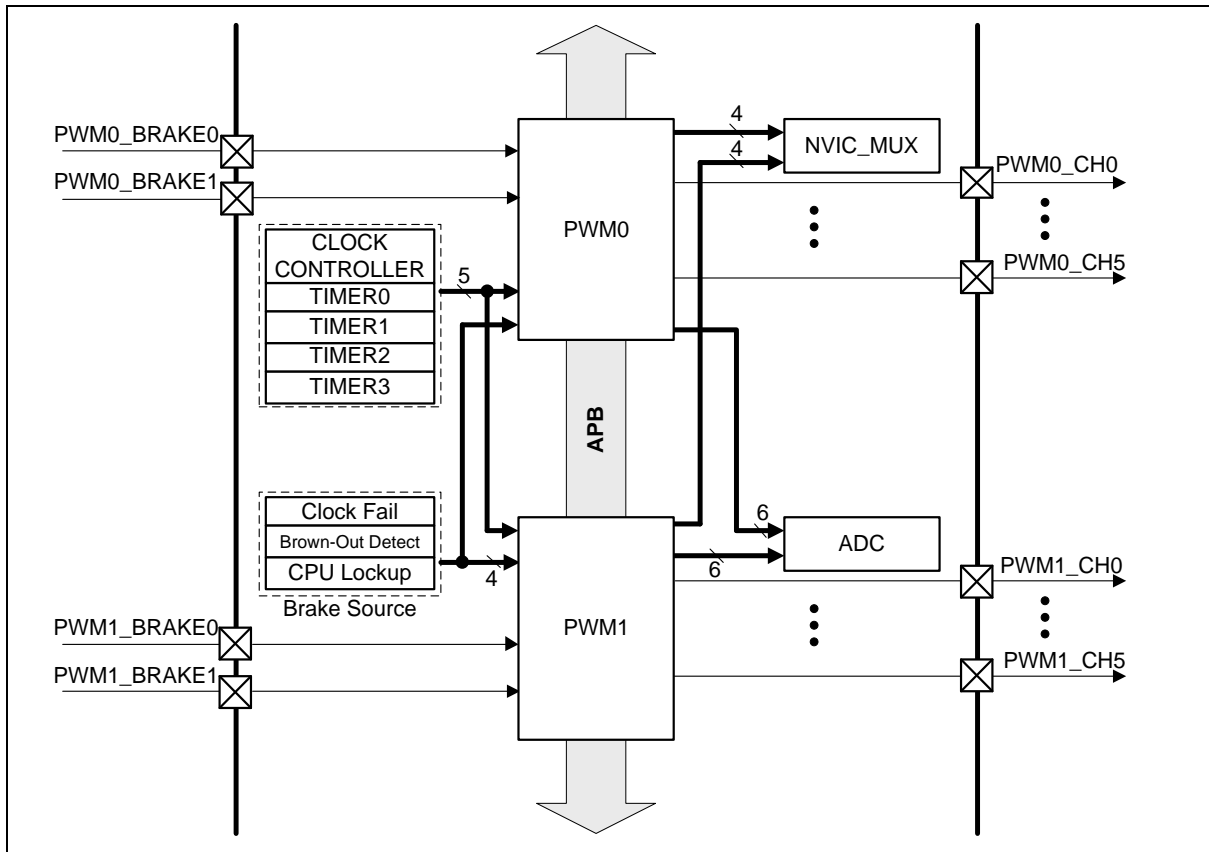

Figure 6.12-1 PWM Generator Overview Block Diagram

PWM Clock frequency can be set equal or double to PCLK frequency as Figure 6.12-2, For the detailed register setting, please refer to Table 6.12-1. Each PWM generator has three clock source inputs, each clock source can be selected from PWM Clock or four TIMER trigger PWM outputs as Figure 6.12-3 by ECLKSRC0 (PWM_CLKSRC[2:0]) for PWM_CLK0, ECLKSRC2 (PWM_CLKSRC[10:8]) for PWM_CLK2 and ECLKSRC4 (PWM_CLKSRC[18:16]) for PWM_CLK4.

Table 6.12-1 PWM Clock Source Control Registers Setting Table

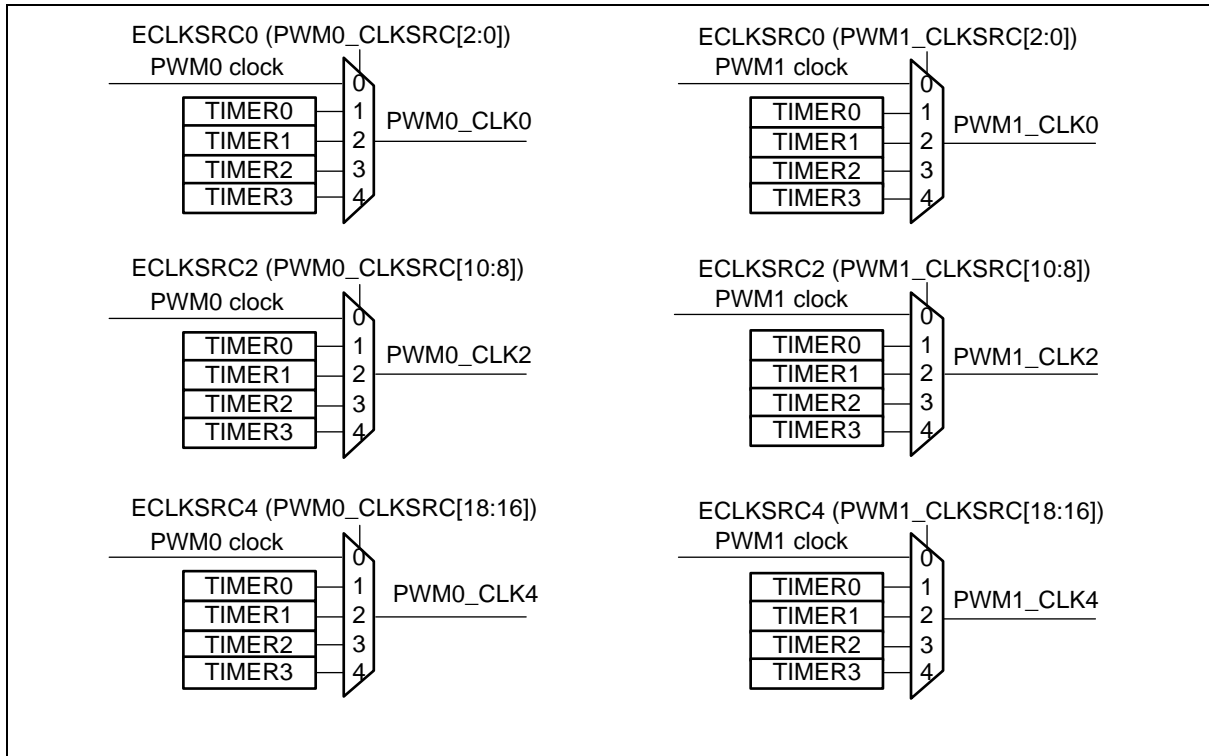

Figure 6.12-3 PWM Clock Source Control

Figure 6.12-4 and Figure 6.12-5 illustrate the architecture of PWM independent mode and complementary mode. No matter independent mode or complementary mode, paired channels' (PWM_CH0 and PWM_CH1, PWM_CH2 and PWM_CH3, PWM_CH4 and PWM_CH5) counters both come from the same clock source and prescaler. When counter count to 0, PERIOD (PWM_PERIODn[15:0]) or equal to comparator, events will be generated. These events are passed to corresponding generators to generate PWM pulse, interrupt signal and trigger signal for ADC to start conversion. Output control is used to changing PWM pulse output state; brake function in output control also generates interrupt events. In complementary mode, even channel use odd channel comparator to generate events.

6.12.5 Functional Description

6.12.5.1 PWM Prescaler

The PWM prescaler is used to divide clock source, prescaler counting CLKPSC +1 times, PWM counter only count once. The prescale double buffer is setting by CLKPSC (PWM_CLKPSCn[11:0], n = 0, 2, 4) bits. Figure 6.12-6 is an example of PWM channel 0 prescale waveform. The prescale counter will reload CLKPSC at the begin of the next prescale counter down-count.

Figure 6.12-6 PWM0_CH0 Prescaler Waveform in Up Counter Type

6.12.5.2 PWM Counter

PWM supports 3 counter types operation: Up Counter, Down Counter and Up-Down Counter types.

For PWM channel0, CNT(PWM_CNT0[15:0]) can clear to 0x00 by CNTCLR0 (PWM_CNTCLR[0]). CNT will be cleared when prescale counter count to 0, and CNTCLR will be set 0 by hardware automatically.

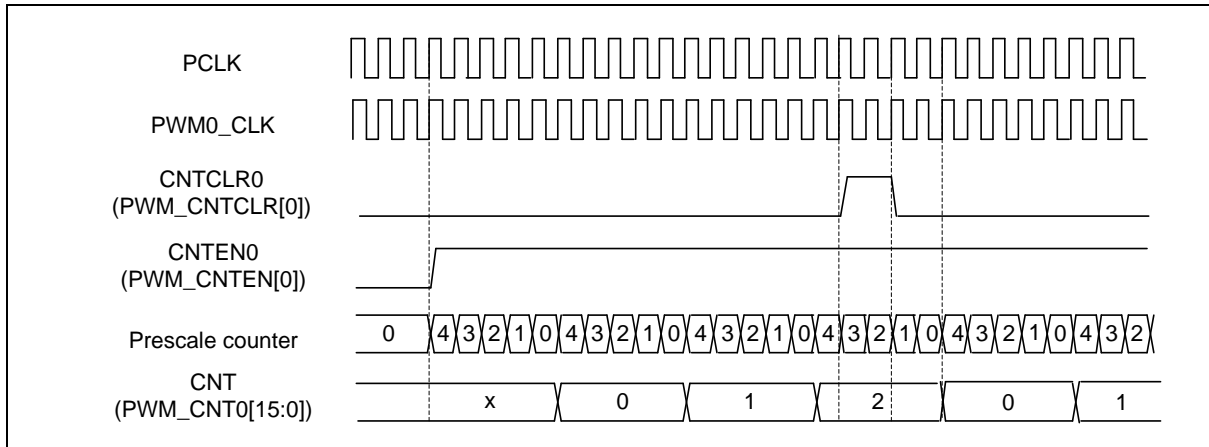

Figure 6.12-7 PWMx Counter Waveform when Setting clear counter

6.12.5.3 Up Counter Type

When PWM counter is set to up counter type, CNTTYPE_n (PWM_CTL1[2n+1:2n], n = 0,1..5) is 0x0, it starts up-counting from 0 to PERIOD (PWM_PERIOD_n[15:0], where n denotes channel number) to complete a PWM period. The current counter value can be read from CNT (PWM_CNT_n[15:0]) bits. PWM generates zero point event when the counter counts to 0 and prescale counts to 0. PWM generates period point event when the counter counts to PERIOD and prescale counts to 0. The Figure 6.12-8 shows an example of up counter, wherein

$$\text{PWM period time} = (\text{PERIOD}+1) * (\text{CLKPSC}+1) * \text{PWMx_CLK.}$$

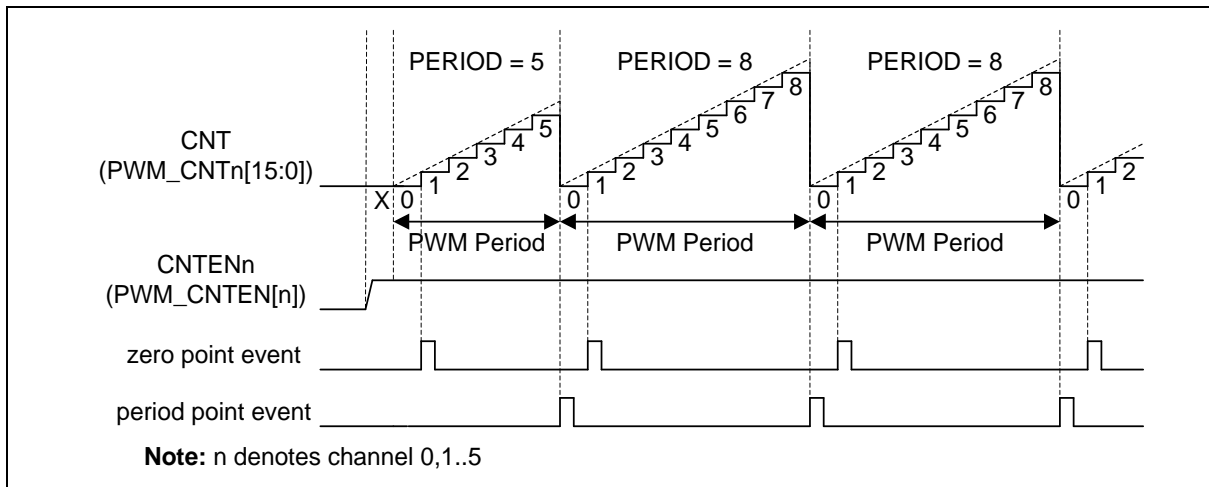

Figure 6.12-8 PWM Up Counter Type

6.12.5.4 Down Counter Type

When PWM counter is set to down counter type, CNTTYPE_n (PWM_CTL1[2n+1:2n], n = 0,1..5) is 0x1, it starts down-counting from PERIOD to 0 to complete a PWM period. The current counter value can be read from CNT (PWM_CNT_n[15:0]) bits. PWM generates zero point event when the counter counts to 0 and prescale counts to 0. PWM generates period point event when the counter counts to PERIOD and prescale counts to 0. The Figure 6.12-9 shows an example of down counter, wherein

$$\text{PWM period time} = (\text{PERIOD}+1) * (\text{CLKPSC}+1) * \text{PWMx_CLK.}$$

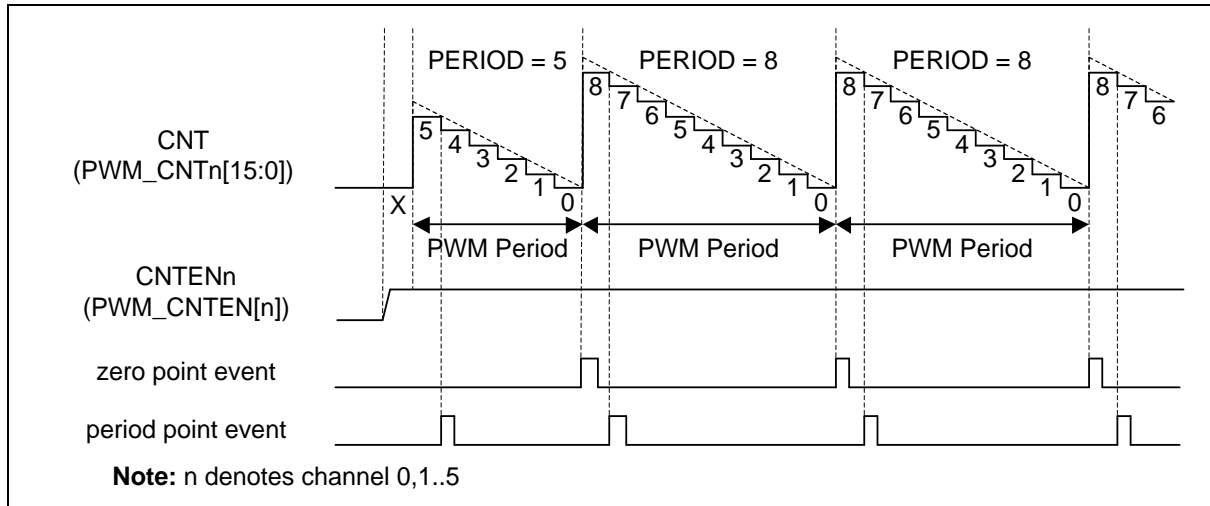

Figure 6.12-9 PWM Down Counter Type

6.12.5.5 Up-Down Counter Type

When PWM counter is set to up-down count type, CNTTYPE_n (PWM_CTL1[2n+1:2n], n = 0,1..5) is 0x2, it starts counting-up from 0 to PERIOD and then starts counting down to 0 to complete a PWM period. The current counter value can be read from CNT (PWM_CNTn[15:0]) bits. PWM generates zero point event when the counter counts to 0 and prescale counts to 0. PWM generates center point event which is equal to period point event when the counter counts to PERIOD. Figure 6.12-10 shows an example of up-down counter, wherein

$$\text{PWM period time} = (2*\text{PERIOD}) * (\text{CLKPSC}+1) * \text{PWMx_CLK.}$$

The DIRF (PWM_CNTn[16]) bit is counter direction indicator flag, where high is up counting, and low is down counting.

Figure 6.12-10 PWM Up-Down Counter Type

6.12.5.6 PWM Comparator

CMPDATn is a basic comparator register of PWM channel n; In Independent mode each channel only has one comparator, the value of CMPDATn register is continuously compared to the corresponding channel's counter value. In Complementary mode each paired channels has two comparators, and the value of CMPDATn and CMPDATm (n = 0,2,4, m = 1,3,5) registers are continuously compared to the complementary even channel's counter value, because of odd channel's counter is useless. For example, channel 0 and channel 1 are complementary channels, in Complementary mode, channel 1's comparator is continuously compared to channel 0's counter, but not channel 1's. When the counter is equal to value of CMPDAT0 register, PWM generates a compared point event and uses the event to generate PWM pulse, interrupt or use to trigger ADC. In up-down counter type, two events will be generated in a PWM period as shown in Figure 6.12-11. The CMPU is up count compared point event and CMPD is down count compared point event.

Figure 6.12-11 PWM Compared point Events in Up-Down Counter Type

6.12.5.7 PWM Double Buffering

The double buffering uses double buffers to separate software writing and hardware action operation timing. There are three loading modes for loading values to buffer: period loading mode, immediately loading mode, and center loading mode. After registers are modified through software, hardware will load register value to the buffer register according to the loading mode timing. The hardware action is based on the buffer value. This can prevent asynchronously operation problem due to software and hardware asynchronism.

The PWM provides PBUF (PWM_PBUFn[15:0]) as the active PERIOD buffer register, CMPBUF (PWM_CMPBUFn[15:0]) as the active CMPDAT buffer register. The concept of double buffering is used in loading modes, which are described in the following sections. For example, as shown Figure 6.12-12, in period loading mode, writing PERIOD and CMPDAT through software, PWM will load new values to their buffer PBUF (PWM_PBUFn[15:0]) and CMPBUF (PWM_CMPBUFn[15:0]) at start of the next period without affecting the current period counter operation.

Figure 6.12-12 PWM Double Buffering Illustration

6.12.5.8 Period Loading Mode

When immediately loading mode, and center loading mode are disabled that IMMLDENn bits, and CTRLn bits of PWM_CTL0 register are set to 0, PWM operates at period Loading mode. In period Loading mode, PERIOD(PWM_PERIODn[15:0]) and CMP(PWM_CMPDATn[15:0]) will all load to their active PBUF and CMPBUF registers while each period is completed. For example, after PWM counter up counts from zero to PERIOD in the up-counter operation or down counts from PERIOD to zero in the down-counter operation or counts up from 0 to PERIOD and then counts down to 0 in the up-down counter operation.

Figure 6.12-13 shows period loading timing of up-count operation, where PERIOD DATA0 denotes the initial data of PERIOD, PERIOD DATA1 denotes the first updated PERIOD data by software and so on. CMPDAT also follows this rule. The following describes steps sequence of Figure 6.12-13. User can know the PERIOD and CMPDAT update condition, by watching PWM period and CMPU event.

1. Software writes CMPDAT DATA1 to CMPDAT at point 1.
2. Hardware loads CMPDAT DATA1 to CMPBUF at the end of PWM period at point 2.
3. Software writes PERIOD DATA1 to PERIOD at point 3.
4. Hardware loads PERIOD DATA1 to PBUF at the end of PWM period at point 4.
5. Software writes PERIOD DATA2 to PERIOD at point 5.
6. Hardware loads PERIOD DATA2 to PBUF at the end of PWM period at point 6.

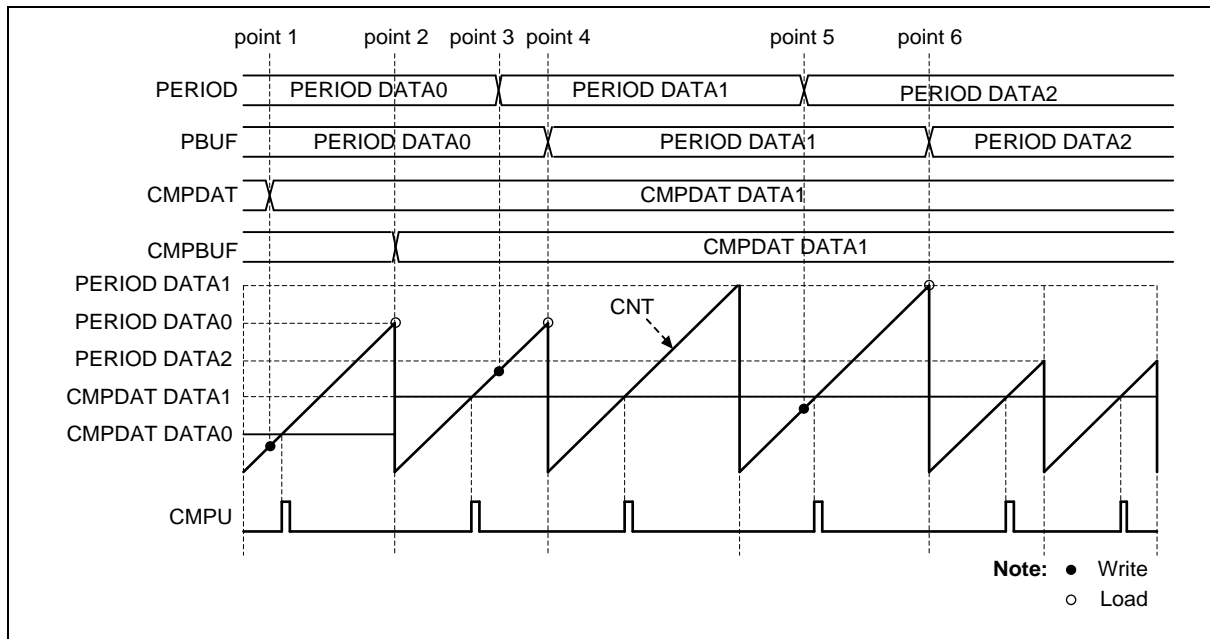

Figure 6.12-13 Period Loading in Up-Count Mode

6.12.5.9 Immediately Loading Mode

If the IMMLDENn (PWM_CTL0[21:16]) bit is set to 1, PWM operates at immediately loading mode. In immediately loading mode, when user update PERIOD (PWM_PERIODn[15:0]) or CMP (PWM_CMPDATn[15:0]), PERIOD or CMPDAT will be load to active PBUF (PWM_PBUFn[15:0]) or CMPBUF (PWM_CMPBUFn[15:0]) after current counter count is completed. If the updated PERIOD value is less than current counter value, counter will count to 0xFFFF, when counter count to 0xFFFF and prescale count to 0, the flag CNTMAXF(PWMx_STATUS[5:0]) will raise, and then counter will count wraparound. Immediately loading mode has the highest priority. If IMMLDENn has been set, other loading mode for channel n will become invalid. Figure 6.12-14 shows an example and its steps sequence is described below.

1. Software writes CMPDAT DATA1 and hardware immediately loading CMPDAT DATA1 to CMPBUF at point 1.
2. Software writes PERIOD DATA1 which is greater than current counter value at point 2; counter will continue counting until equal to PERIOD DATA1 to finish a period loading.
3. Software writes PERIOD DATA2 which is less than the current counter value at point 3; counter will continue counting to its maximum value 0xFFFF and count wraparound from 0 to PERIOD DATA2 to finish this period loading.

Figure 6.12-14 Immediately Loading in Up-Count Mode

6.12.5.10 Center Loading Mode

When the CTRL_n (PWM_CTL0[5:0]) bit is set to 1 and PWM counter is set to up-down count type, CNTTYPE_n (PWM_CTL1[2n+1:2n], n = 0,1..5) is 0x2, PWM operates at center loading mode. In center loading mode, CMP(PWM_CMPDAT_n[15:0]) will load to active CMPBUF register in center of each period, that is, counter counts to PERIOD. PERIOD(PWM_PERIOD_n[15:0]) will all load to their active PBUF registers while each period is completed. Figure 6.12-15 shows an example and its steps sequence is described below.

1. Software writes CMPDAT DATA1 at point 1.
2. Hardware loads CMPDAT DATA1 to CMPBUF at center of PWM period at point 2.
3. Software writes PERIOD DATA1 at point 3.
4. Hardware loads PERIOD DATA1 to PBUF at the end of PWM period at point 4.
5. Software writes CMPDAT DATA2 at point 5.
6. Hardware loads CMPDAT DATA2 to CMPBUF at center of PWM period at point 6.
7. Software writes PERIOD DATA2 at point 7.
8. Hardware loads PERIOD DATA2 to PBUF at the end of PWM period at point 8.

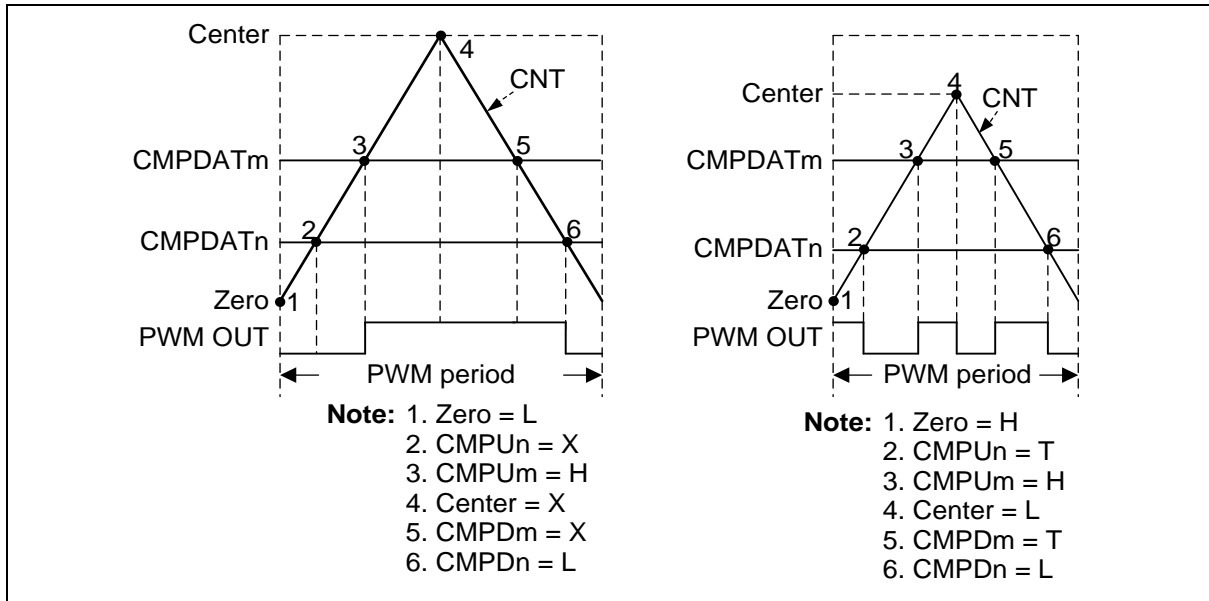

Figure 6.12-16 PWM Pulse Generation

The generation events may sometimes set to the same value, as the reason, events priority between different counter types are list below, up counter type (Table 6.12-2), down counter type (Table 6.12-3) and up-down counter type (Table 6.12-4). By using event priority, user can easily generate 0% to 100% duty pulse as shown in Figure 6.12-17.

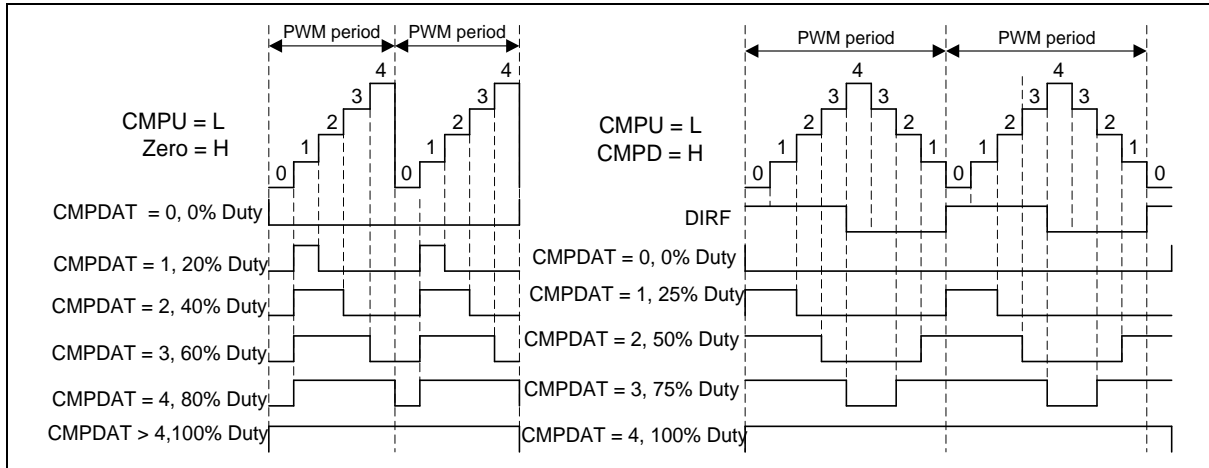

Figure 6.12-17 PWM 0% to 100% Pulse Generation

Priority	Up Event
1 (Highest)	Period event (CNT = PERIOD)

6.12.5.13 PWM Output Mode

The PWM supports two output modes: Independent mode which may be applied to DC motor system, Complementary mode with dead-time insertion which may be used in the application of AC induction motor and permanent magnet synchronous motor.

6.12.5.14 Independent mode

By default, the PWM is operating in independent mode, independent mode is enabled when channel n corresponding PWMMODEn (PWM_CTL1[26:24]) bit is set to 0. In this mode six PWM channels: PWM_CH0, PWM_CH1, PWM_CH2, PWM_CH3, PWM_CH4 and PWM_CH5 are running off its own period and duty as shown in Figure 6.12-18.

Figure 6.12-18 PWM Independent Mode Waveform

6.12.5.15 Complementary mode

Complementary mode is enabled when the pair channel corresponding PWMMODEn (PWM_CTL1[26:24]) bit set to 1. In this mode there are 3 PWM generators utilized for complementary

mode, with total of 3 PWM output paired pins in this module. In Complimentary modes, the internal odd PWM signal must always be the complement of the corresponding even PWM signal. PWM_CH1 will be the complement of PWM_CH0. PWM_CH3 will be the complement of PWM_CH2 and PWM_CH5 will be the complement of PWM_CH4 as shown in Figure 6.12-19.

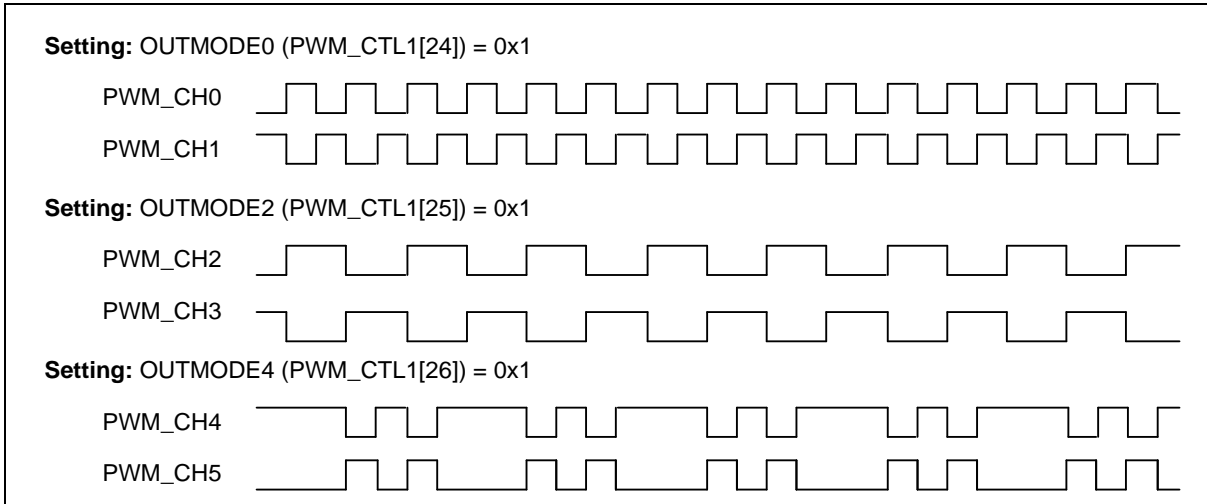

Figure 6.12-19 PWM Complementary Mode Waveform

6.12.5.16 PWM Output Control

After PWM pulse generation, there are four to six steps to control the output of PWM channels. In independent mode, there are Mask, Brake, Pin Polarity and Output Enable four steps as shown in Figure 6.12-20. In complementary mode, it needs two more steps to precede these four steps, Complementary channels and Dead-Time Insertion as shown in Figure 6.12-21.

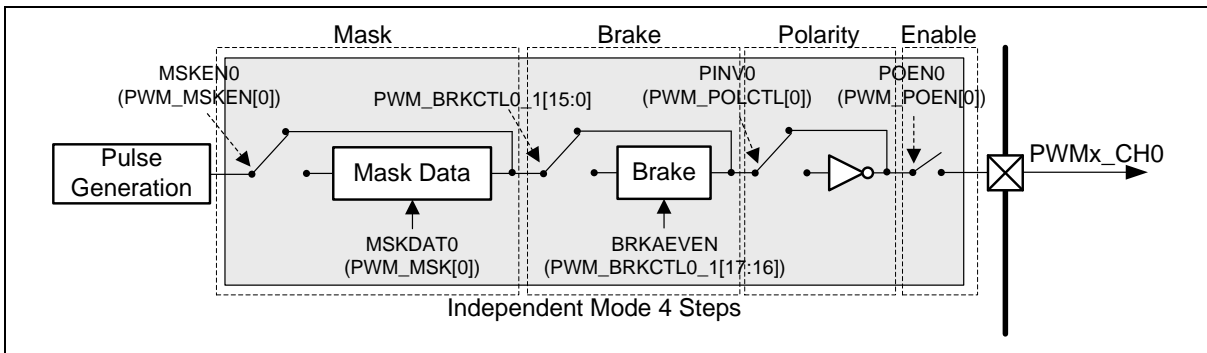

Figure 6.12-20 PWMx_CH0 Output Control in Independent Mode

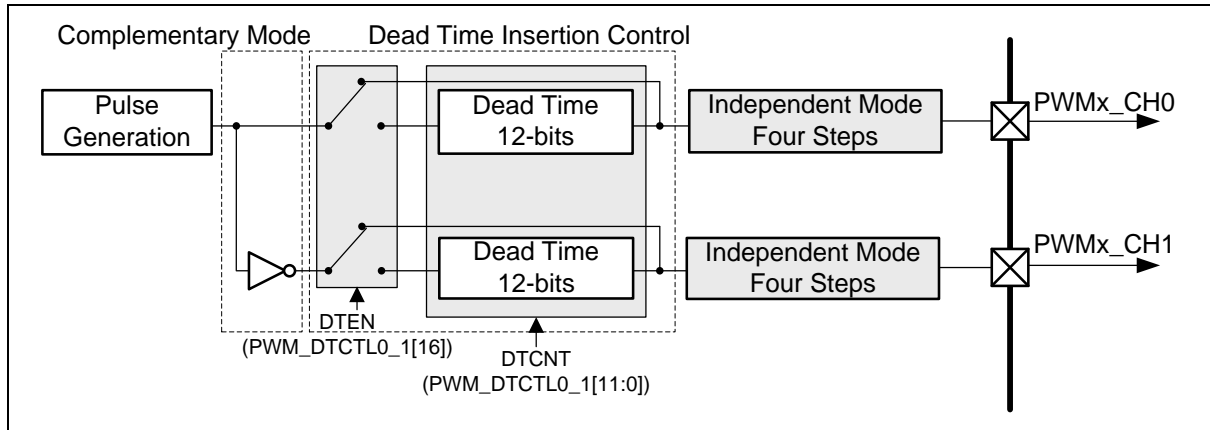

Figure 6.12-21 PWMx_CH0 and PWMx_CH1 Output Control in Complementary Mode

6.12.5.17 Dead-Time Insertion

In the complementary application, the complement channels may drive the external devices like power switches. The dead-time generator inserts a low level period called “dead-time” between complementary outputs to drive these devices safely and to prevent system or devices from the burn-out damage. Hence the dead-time control is a crucial mechanism to the proper operation of the complementary system. By setting corresponding channel n DTEN (PWM_DTCTLn_m[16]) bit to enable dead-time function and DTCNT (PWM_DTCTLn_m[11:0]) to control dead-time period, the dead-time can be calculated from the following formula:

$$\text{Dead-time} = (\text{DTCNT (PWM_DTCTLn[11:0])} + 1) * \text{PWMx_CLK period}$$

Dead-time insertion clock source can be selected from prescaler output by setting DTCKSEL (PWM_DTCTLn_m[24]) to 1. By default, clock source comes from PWM_CLK, which is prescaler input. Then the dead-time can be calculated from the following formula:

$$\text{Dead-time} = (\text{DTCNT (PWM_DTCTLn[11:0])} + 1) * (\text{CLKPSC (PWM_CLKPSCn [11:0])} + 1) * \text{PWMx_CLK period}$$

Please note that the PWM_DTCTLn_m are write-protected registers.

Figure 6.12-22 indicates the dead-time insertion for one pair of PWM signals.

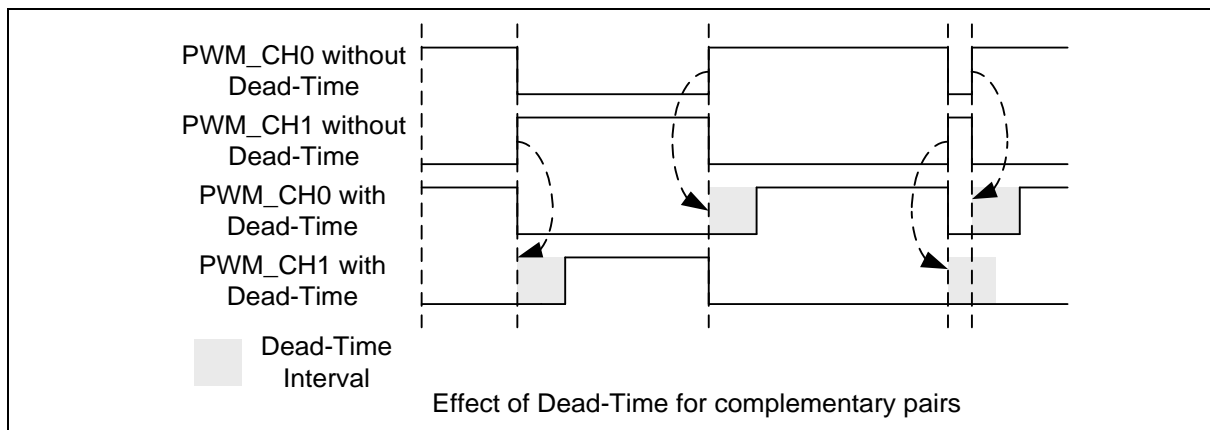

Figure 6.12-22 Dead-Time Insertion

6.12.5.18 PWM Mask Output Function

Each of the PWM channel output value can be manually overridden with the settings in the PWM Mask Enable Control Register (PWM_MSKEN) and the PWM Masked Data Register (PWM_MSK). With these settings, the PWM channel outputs can be assigned to specified logic states independent of the duty cycle comparison units. The PWM mask bits are useful when controlling various types of Electrically Commutated Motor (ECM) like a BLDC motor. The PWM_MSKEN register contains six bits, MSKENn(PWM_MSKEN[5:0]). If the MASKENn is set to active-high, the PWM channel n output will be overridden. The PWM_MSK register contains six bits, MSKDATn(PWM_MSK[5:0]). The bit value of the MSKDATn determines the state value of the PWM channel n output when the channel is overridden. Figure 6.12-23 shows an example of how PWM mask control can be used for the override feature.

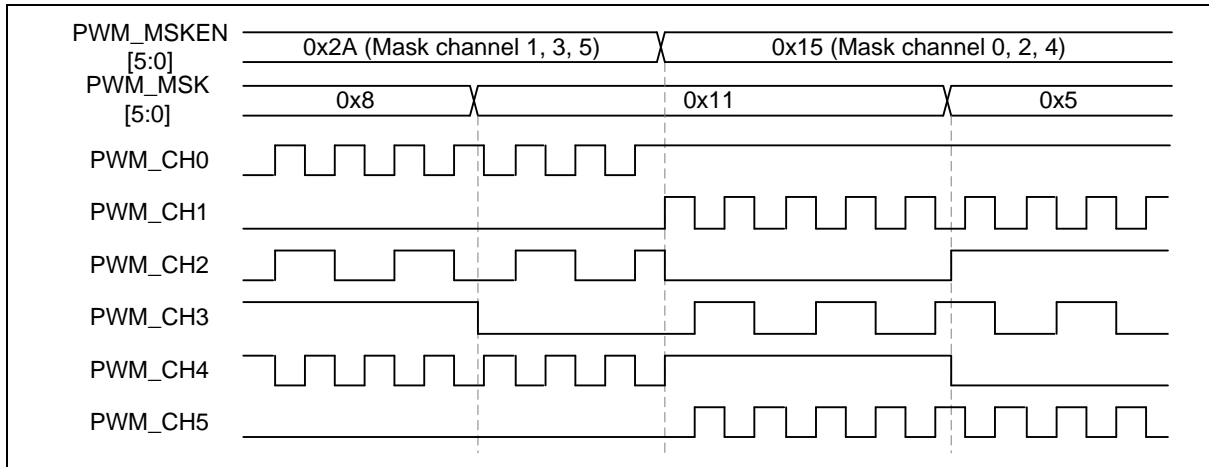

Figure 6.12-23 Illustration of Mask Control Waveform

6.12.5.19 PWM Brake

Each PWM module has two external input brake control signals. User can select active brake pin source is from PWMx_BRAKEy pin by BKxSRC bits of BNF register(x=0,1, y=0,1). The external signals will be filtered by a 3-bit noise filter. User can enable the noise filter function by BRKxNFEN bits of BNF register, and noise filter sampling clock can be selected by settingBRKxNFSEL bits of BNF register to fit different noise properties. Moreover, by setting the BRKxFCNT bits, user can define by how many sampling clock cycles a filter will recognize the effective edge of the brake signal.

In addition, it can be inversed by setting the BRKxPINV (x denotes input external pin 0 or 1) bits of BNF register to realize the polarity setup for the brake control signals. Set BRKxPINV bit to 0, brake event will occurred when PWMx_BRAKEy(x=0,1, y=0,1) pin status is from low to high; set BRKxPINV to 1, brake event will occurred when PWMx_BRAKEy pin status is from high to low.

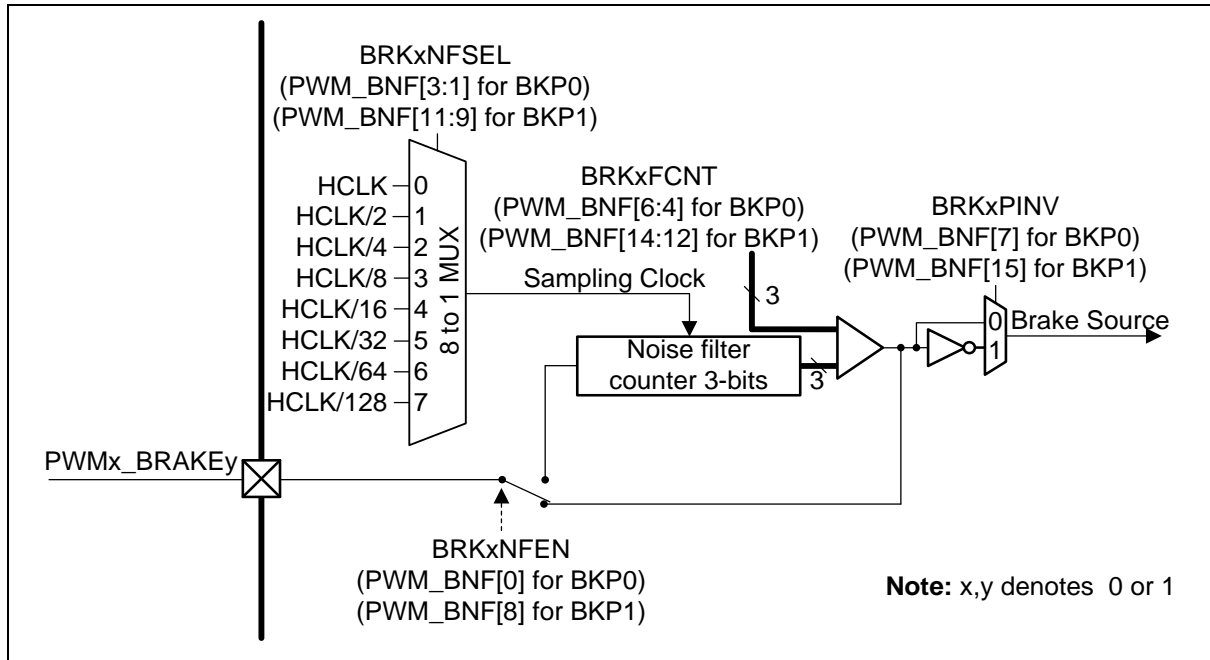

Figure 6.12-24 Brake Noise Filter Block Diagram

For Complementary mode, it is often necessary to set a safe output state to the complement output pairs once the brake event occurs.

Each complementary channel pair shares a PWM brake function, as shown Figure 6.12-25. To control paired channels to output safety state, user can setup BRKAEVEN (PWM_BRKCTL0_1[17:16]) for even channels and BRKAODD (PWM_BRKCTL0_1[19:18]) for odd channels when the fault brake event happens. There are two brake detectors: Edge detector and Level detector. When the edge detector detects the brake signal and BRKEIEN_{n,m} (PWM_INTEN1[2:0]) is enabled, the brake function generates BRK_INT. This interrupt needs software to clear, and the BRKESTS_n (PWM_INTSTS1[21:16]) brake state will keep until the next PWM period starts after the interrupt cleared. The brake function can also operate in another way through the level detector. Once the level detector detects the brake signal and the BRKLIEN_{n,m} (PWM_INTEN1[10:8]) is also enabled, the brake function will generate BRK_INT, but BRKLISTS_n (PWM_INTSTS1[29:24]) brake state will auto recovery to normal output while level brake source recovery to high level and pass through “Low Level Detection” at the PWM waveform period when brake condition removed without clear interrupt.

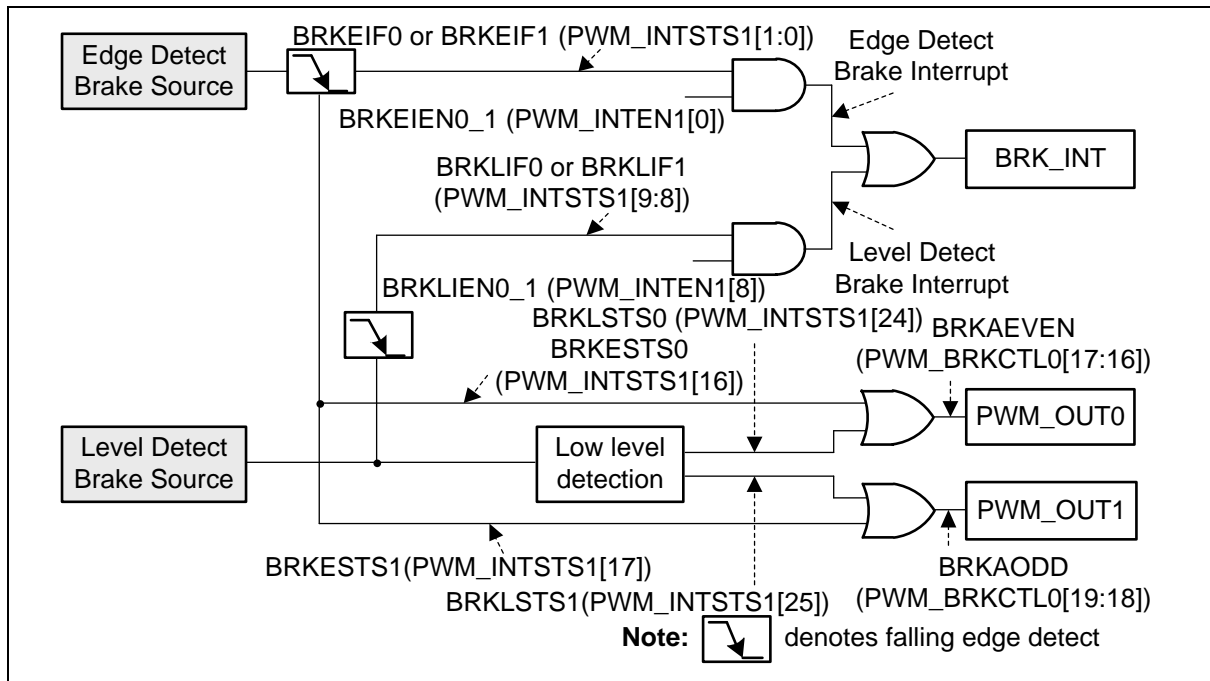

Figure 6.12-25 Brake Block Diagram for PWMx_CH0 and PWMx_CH1 Pair

Figure 6.12-26 illustrates the edge detector waveform for PWMx_CH0 and PWMx_CH1 pair. In this case, the edge detect brake source has occurred twice for the brake events. When the event occurs, both of the BRKEIF0 and BRKEIF1 flags are set and BRKESTS0 and BRKESTS1 bits are also set to indicate brake state of PWMx_CH0 and PWMx_CH1. For the first occurring event, software writes 1 to clear the BRKEIF0 flag. After that, the BRKESTS0 bit is cleared by hardware at the next start of the PWM period. At the same moment, the PWMx_CH0 outputs the normal waveform even though the brake event is still occurring. The second event also triggers the same flags, but at this time, software writes 1 to clear the BRKEIF1 flag. Afterward, PWMx_CH1 outputs normally at the next start of the PWM period.

As a contrast to the edge detector example, Figure 6.12-27 illustrates the level detector waveform for PWMx_CH0 and PWMx_CH1 pair. In this case, the BRKLIF0 and BRKLIF1 flags can only indicate the brake event having occurred. The BRKLESTS0 and BRKLESTS1 brake states will automatically recover at the start of the next PWM period no matter at what states the BRKLIF0 and BRKLIF1 flags are at that moment.

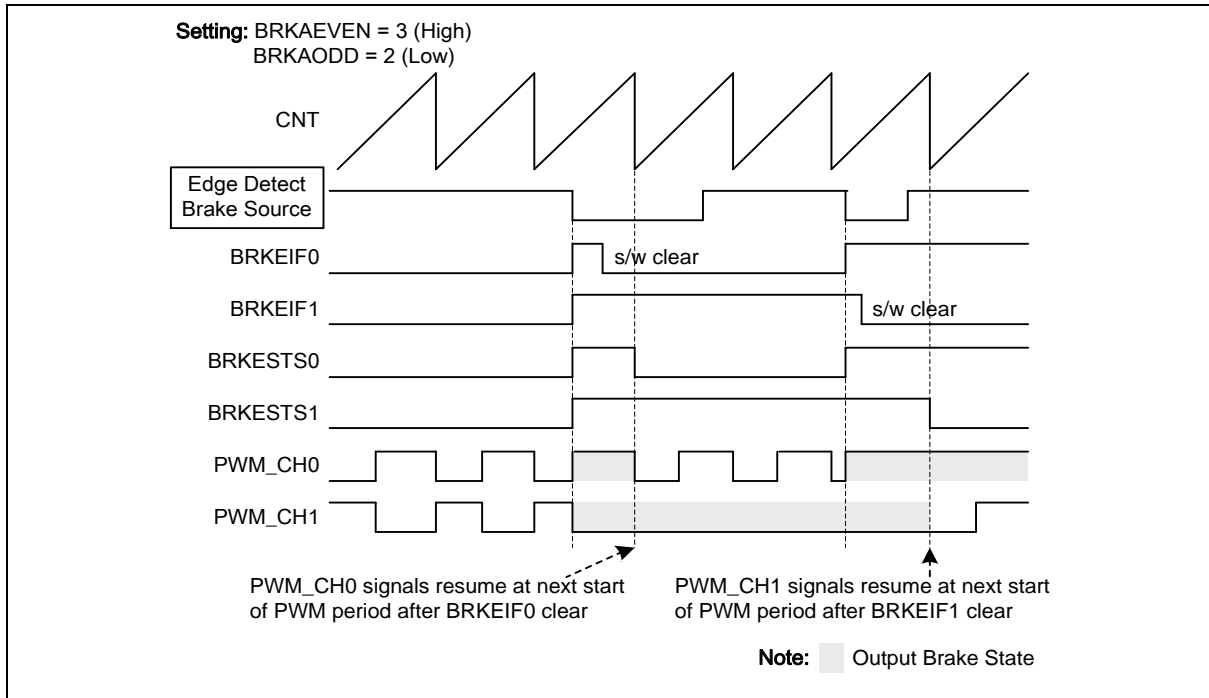

Figure 6.12-26 Edge Detector Waveform for PWMx_CH0 and PWMx_CH1 Pair

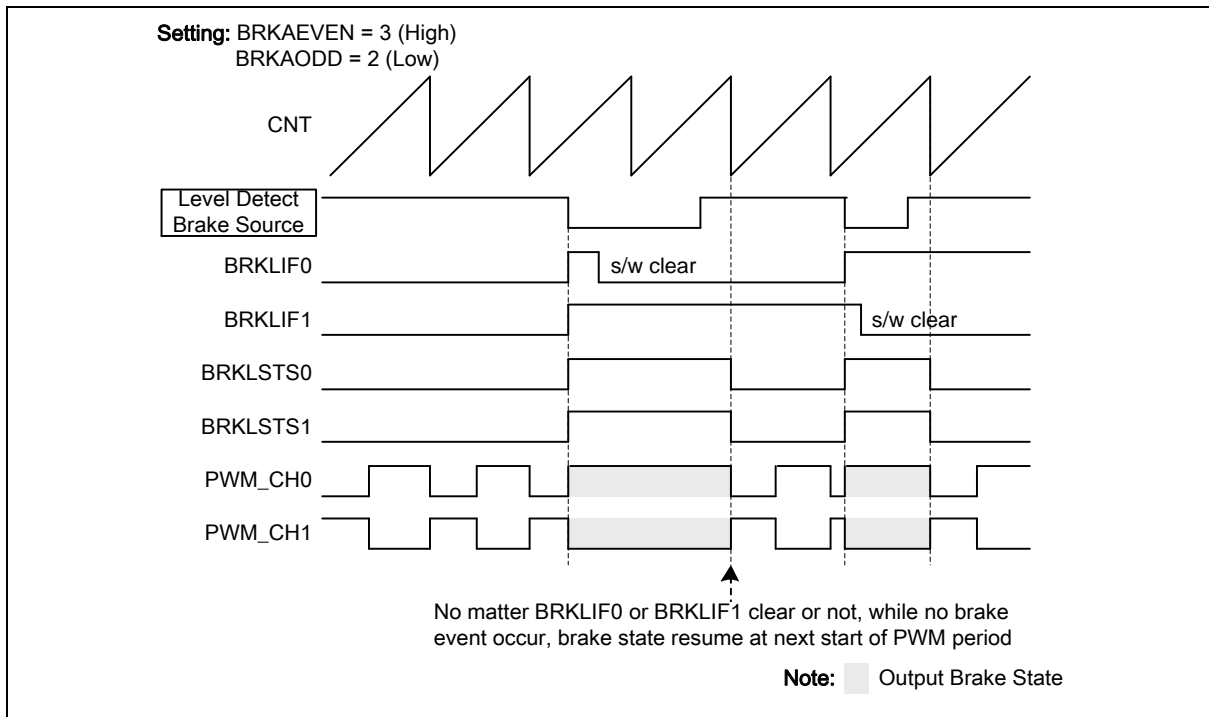

Figure 6.12-27 Level Detector Waveform for PWMx_CH0 and PWMx_CH1 Pair

The two kinds of detectors detect the same six brake sources: two from external input signals, two from analog comparators(ACMP), and one from system fail, and one from software triggered, that are shown in Figure 6.12-28. ACMP brake sources will be detected only when internal ACMP0_O or ACMP1_O signal from low to high.

Among the above described brake sources, the brake source coming from system fail can still be

specified to several different system fail conditions. These conditions include clock fail, Brown-out detect, and Core lockup. Figure 6.12-29 shows that by setting corresponding enable bits, the enabled system fail condition can be one of the sources to issue the Brake system fail to the PWM brake.

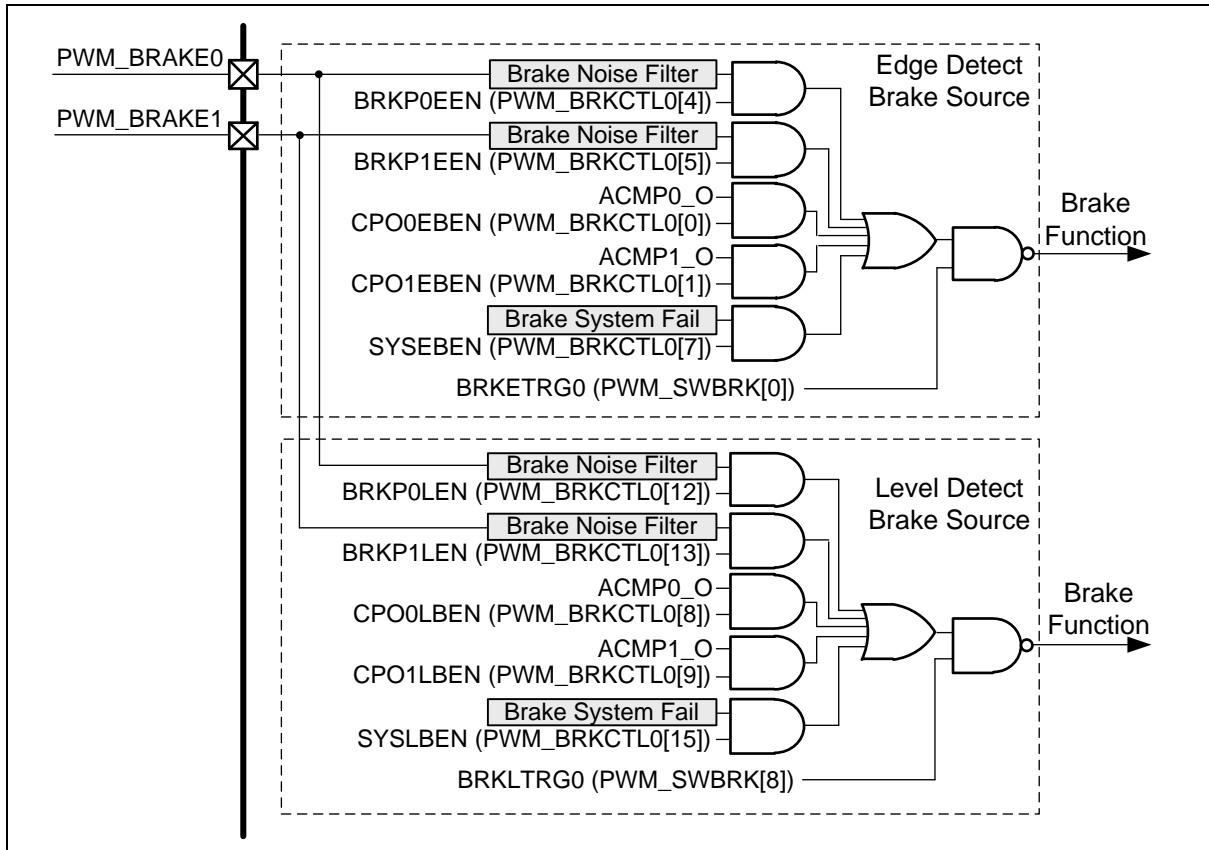

Figure 6.12-28 Brake Source Block Diagram

Figure 6.12-29 Brake System Fail Block Diagram

6.12.5.20 Polarity Control

Each PWM port, from PWM_CH0 to PWM_CH5, has an independent polarity control module to configure the polarity of the active state of the PWM output. By default, the PWM output is active high. This implies the PWM OFF state is low and ON state is high. This definition is variable through setting the PWM Negative Polarity Control Register (PWM_POLCTL), for each individual PWM channel. Figure 6.12-30 shows the initial state before PWM starting with different polarity settings.

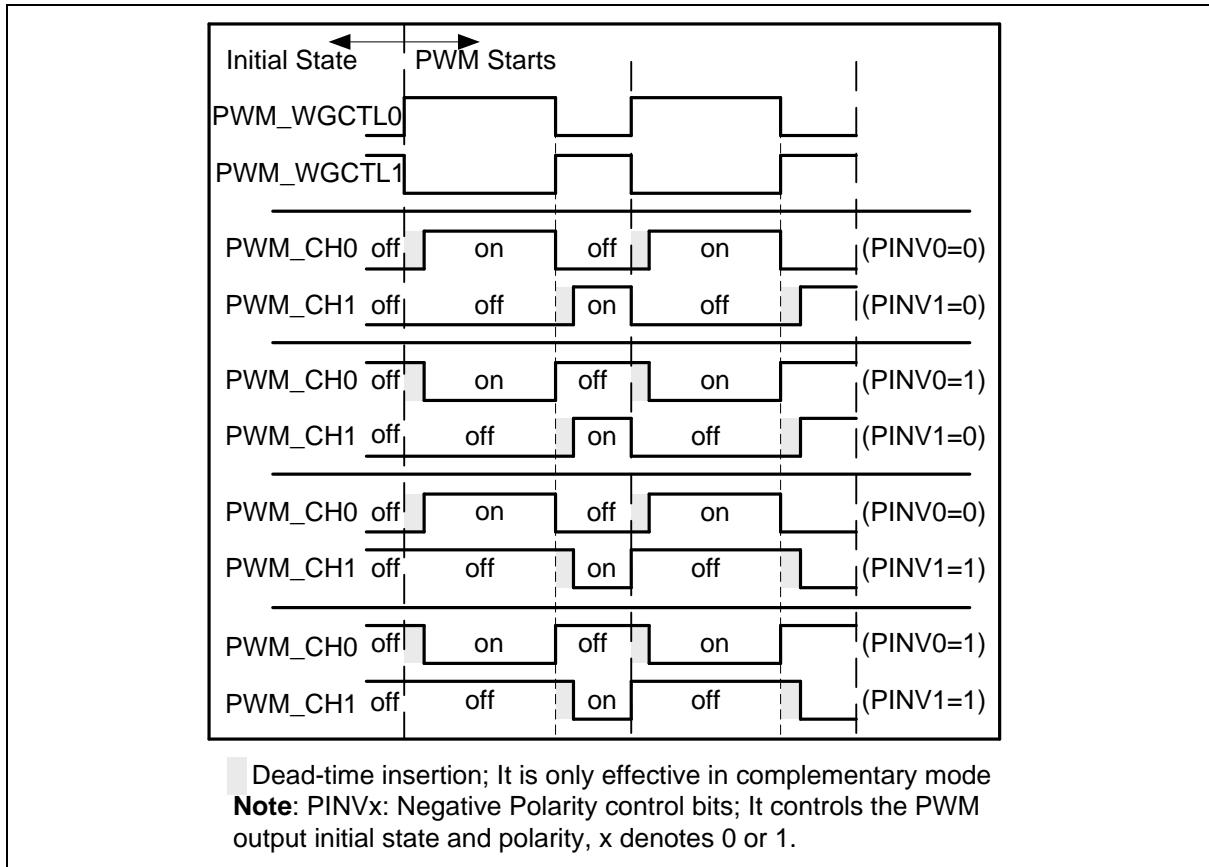

Figure 6.12-30 Initial State and Polarity Control with Rising Edge Dead-Time Insertion

6.12.5.21 Synchronous start function

The synchronous start function can be enabled when SSEN0 (PWM_SSCTL[0]) is set. User can select synchronous source which is from PWM0 or PWM1 by SSRC (PWM_SSCTL[9:8]). The selected PWM channels (include channel0 to channel5 of each PWM) will start counting at the same time once the synchronous start function is enabled and set CNTSEN (PWM_SSTRG). It is noted that set CNTSEN (PWM_SSTRG) will also set the counter enable bit (CNTENn, n denotes channel 0 to 5) to start counting.

6.12.5.22 PWM Interrupt Generator.

There are three independent interrupts for each PWM as shown in Figure 6.12-31.

The 1st PWM interrupt (PWM_INT) comes from PWM complementary pair events. The counter can generate the Zero point Interrupt Flag ZIFn (PWM_INTSTS0[n], n=0,2,4) and the Period point Interrupt Flag PIFn (PWM_INTSTS0[n+8], n=0,2,4). When PWM channel n's counter equals to the comparator value stored in PWM_CMPDATn, the different interrupt flags will be triggered depending on the counting direction. If the matching occurs at up-count direction, the Up Interrupt Flag CMPUIFn (PWM_INTSTS0[21:16]) is set and if matching at the opposite direction, the Down Interrupt Flag CMPDIFn (PWM_INTSTS0[29:24]) is set. If the corresponding interrupt enable bits are set, the trigger events will generate interrupt signals.

The 2nd interrupt is the capture interrupt (CAP_INT). It shares the PWM_INT vector in NVIC. The CAP_INT can be generated when the CRLIFn (PWM_CAPIF[5:0]) is triggered and the Capture Rising Interrupt Enable bit CAPRIENn (PWM_CAPIEN[5:0]) is set to 1. Or in the falling edge condition, the CFLIFn (PWM_CAPIF[13:8]) can be triggered when the Capture Falling Interrupt Enable bit CAPFIENn (PWM_CAPIEN[13:8]) is set to 1.

The last one is the brake interrupt (BRK_INT). The detail of the BRK_INT is described in the PWM

Brake section.

Figure 6.12-31 demonstrates the architecture of the PWM interrupts.

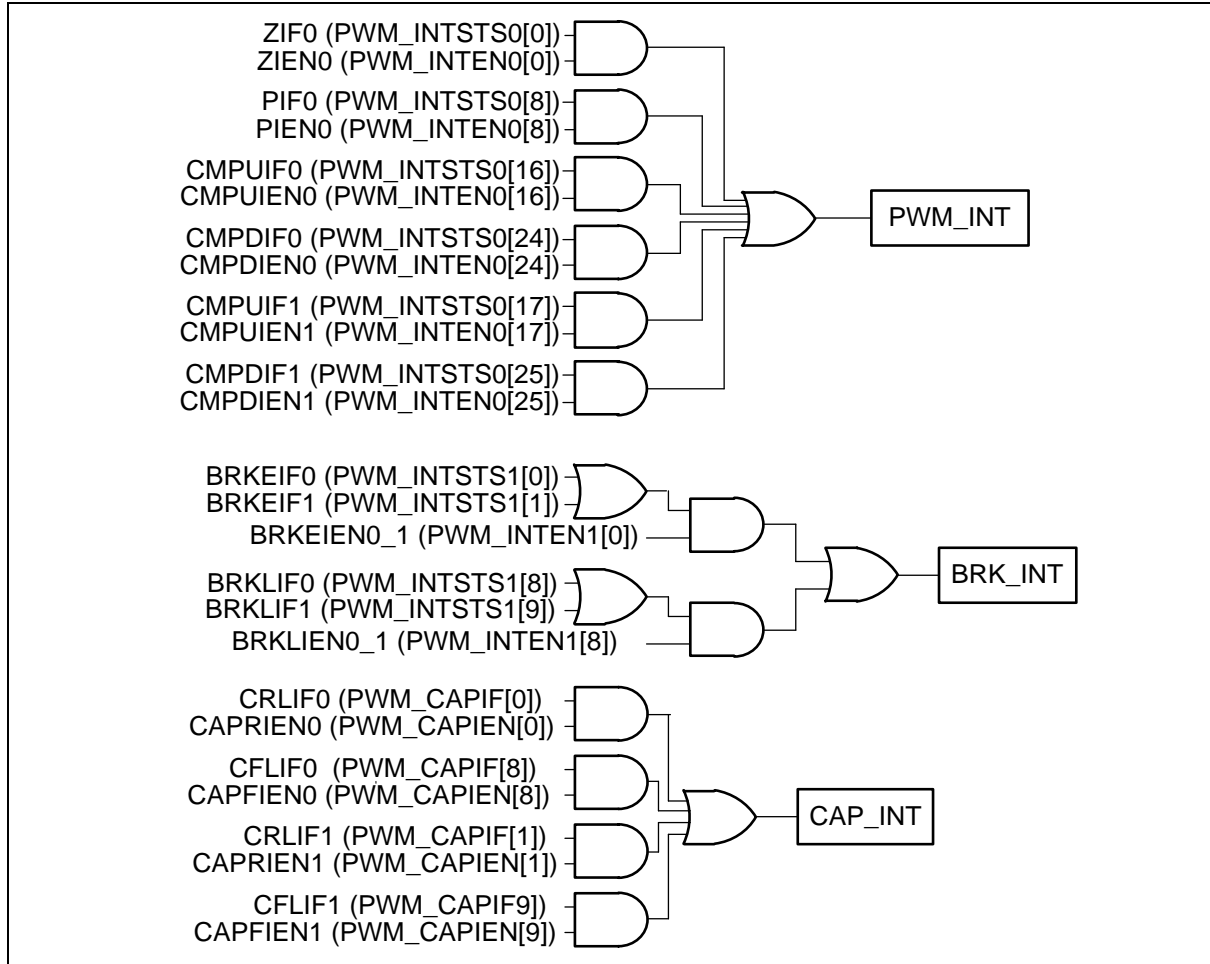

Figure 6.12-31 PWM_CH0 and PWM_CH1 Pair Interrupt Architecture Diagram

6.12.5.23 PWM Trigger ADC Generator

PWM can be one of the ADC conversion trigger source. Each PWM pair channels share the same trigger source. Setting TRGSELn is to select the trigger sources, where TRGSELn is TRGSEL0, TRGSEL1, ..., and TRGSEL5, which are located in PWM_ADCTS0[3:0], PWM_ADCTS0[11:8], PWM_ADCTS0[19:16], PWM_ADCTS0[27:24], PWM_ADCTS1[3:0] and PWM_ADCTS1[11:8], respectively. Setting TRGENn is to enable the trigger output to ADC, where TRGENn is TRGEN0, TRGEN1, ..., TRGEN5, which are located in PWM_ADCTS0[7], PWM_ADCTS0[15], PWM_ADCTS0[23], PWM_ADCTS0[31], PWM_ADCTS1[7] and PWM_ADCTS1[15], respectively. The number n (n = 0,1, ...,5) denotes PWM channel number.

There are 7 PWM events can be selected as the trigger source for one pair of channels. Figure 6.12-32 is an example of PWM_CH0 and PWM_CH1. PWM can trigger ADC to start conversion in different timings by setting PERIOD and CMPDAT. Figure 6.12-33 is the trigger ADC timing waveform in the up-down counter type.

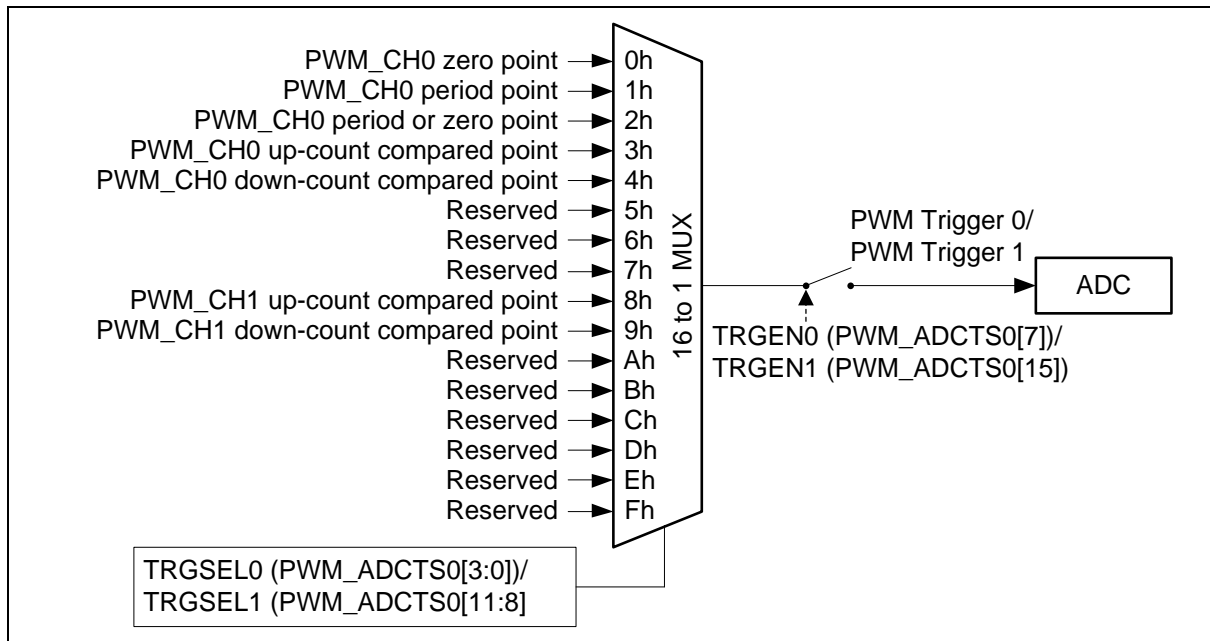

Figure 6.12-32 PWMx_CH0 and PWMx_CH1 Pair Trigger ADC Block Diagram

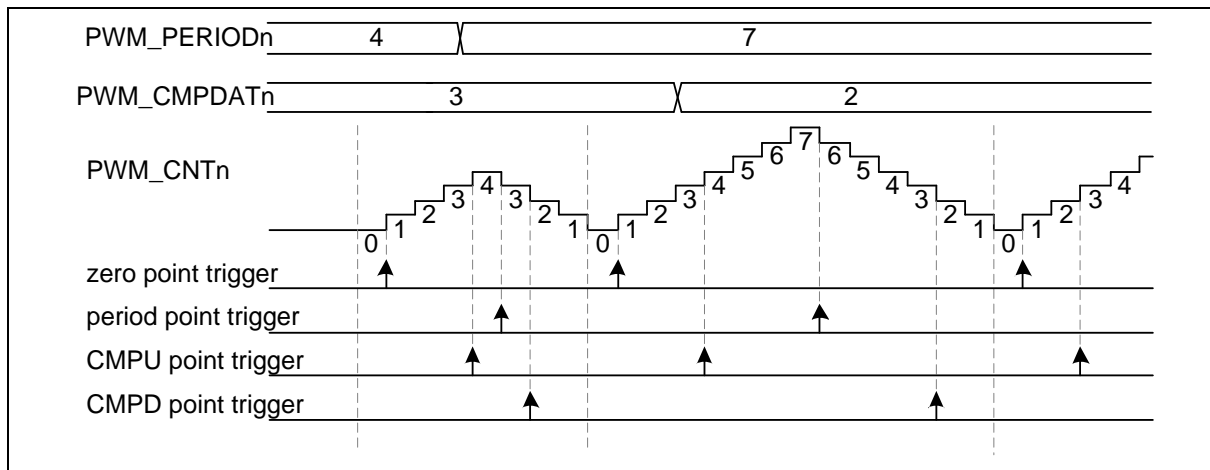

Figure 6.12-33 PWM Trigger ADC in Up-Down Counter Type Timing Waveform

6.12.5.24 Capture Operation

The channels of the capture input and the PWM output share the same pin and counter. The counter can operating in up or down counter type. The capture function will always latch the PWM counter to the RCAPDATn (PWM_RCAPDATn[15:0]) bits or the FCAPDATn (PWM_FCAPDATn[15:0]) bits, if the input channel has a rising transition or a falling transition, respectively. The capture function will also generate an interrupt CAP_INT (using PWM_INT vector) if the rising or falling latch occurs and the corresponding channel n's rising or falling interrupt enable bits are set, where the CAPRIENn (PWM_CAPIEN[5:0]) bit is for the rising edge and the CAPFIENn (PWM_CAPIEN[13:8]) bit is for the falling edge. When rising or falling latch occurs, the corresponding PWM counter may be reloaded with the value of PWM_PERIODn register, depending on the setting of RCRLDENn or FCRLDENn bits (where RCRLDENn and FCRLDENn are located at PWM_CAPCTL[21:16] and PWM_CAPCTL[29:24], respectively). Note that the corresponding GPIO pins must be configured as the capture function by enable the CAPINENn (PWM_CAPINEN[5:0]) bits for the corresponding capture channel n. Figure 6.12-34 is the capture block diagram of channel 0.

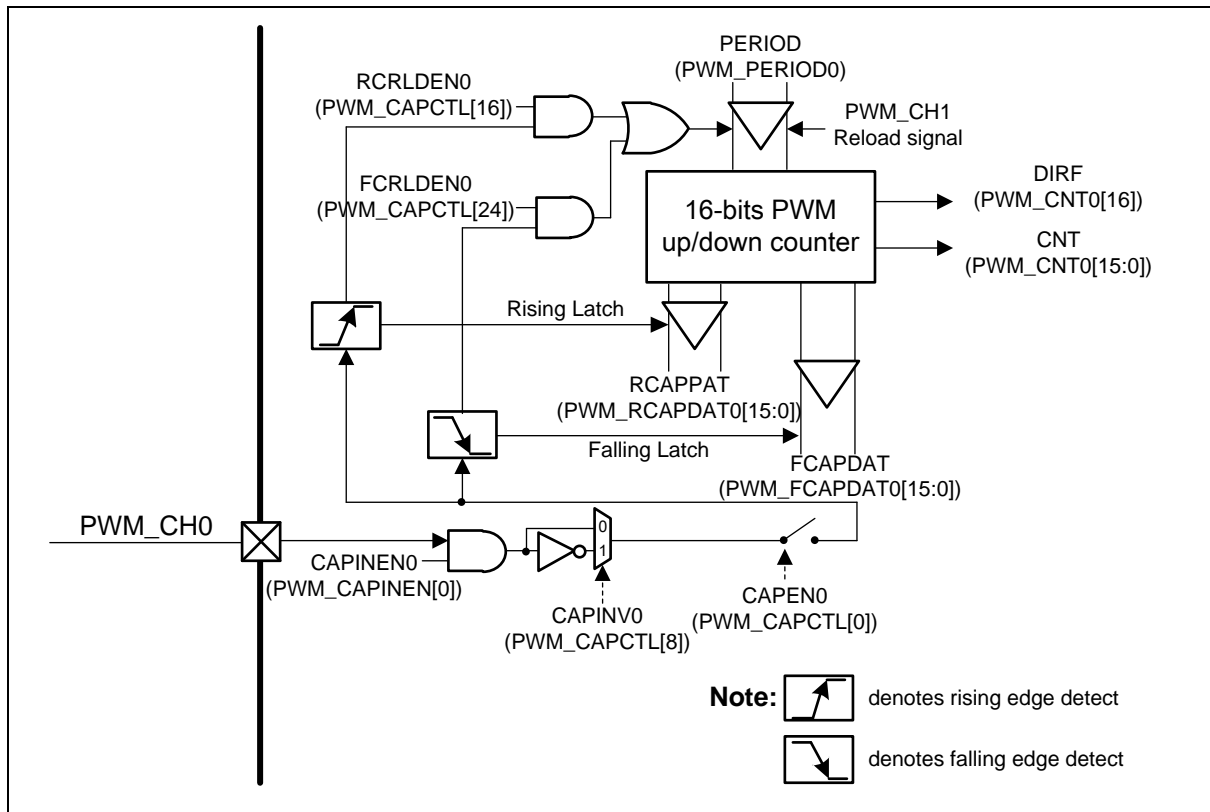

Figure 6.12-34 PWM_CH0 Capture Block Diagram

Figure 6.12-35 illustrates the capture function timing. In this case, the capture counter is set as PWM down counter type and the PERIOD is set to 8 so that the counter counts in the down direction, from 8 to 0. When detecting a falling edge at the capture input pin, the capture function latches the counter value to the PWM_FCAPDATn register. When detecting the rising edge, it latches the counter value to the PWM_RCAPDATn register. In this timing diagram, when the falling edge is detected at the first time, the capture function will reload the counter value from the PERIOD setting because the FCRLDENn bit is enabled. But at the second time, the falling edge does not result in a reload because of the disabled FCRLDENn bit. In this example, the counter also reloads at the rising edge of the capture input because the RCRLDENn bit is enabled, too.

Moreover, if the case is setup as the up counter type, the counter will reload the value zero and count up to the value PERIOD.

Figure 6.12-35 also illustrates the timing example for the interrupt and interrupt flag generation. When the rising edge at channel n is detected, the corresponding CRLIFn (PWM_CAPIF[5:0]) bit is set by hardware. Similarly, a falling edge detection at channel n causes the corresponding CFLIFn (PWM_CAPIF[13:8]) bit is set by hardware. CRLIFn and CFLIFn bits can be cleared by software by writing '1'. If the CRLIFn bit is set and the CAPRIENn bit is enabled, the capture function generates an interrupt. If the CFLIFn bit is set and the CAPFIENn is enabled, the interrupt also happens.

A condition which is not shown in this figure is: if the rising latch happens again when the CRLIFn bit is already set, the Over run status CRLIFOVn (PWM_CAPSTS[5:0]) bit will be set to 1 by hardware to indicate the CRLIF flag overrunning. Also, if the falling latch happens again, the same hardware operation occurs for the CFLIF interrupt flag and the Over run status CFLIFOVn (PWM_CAPSTS[13:8]).

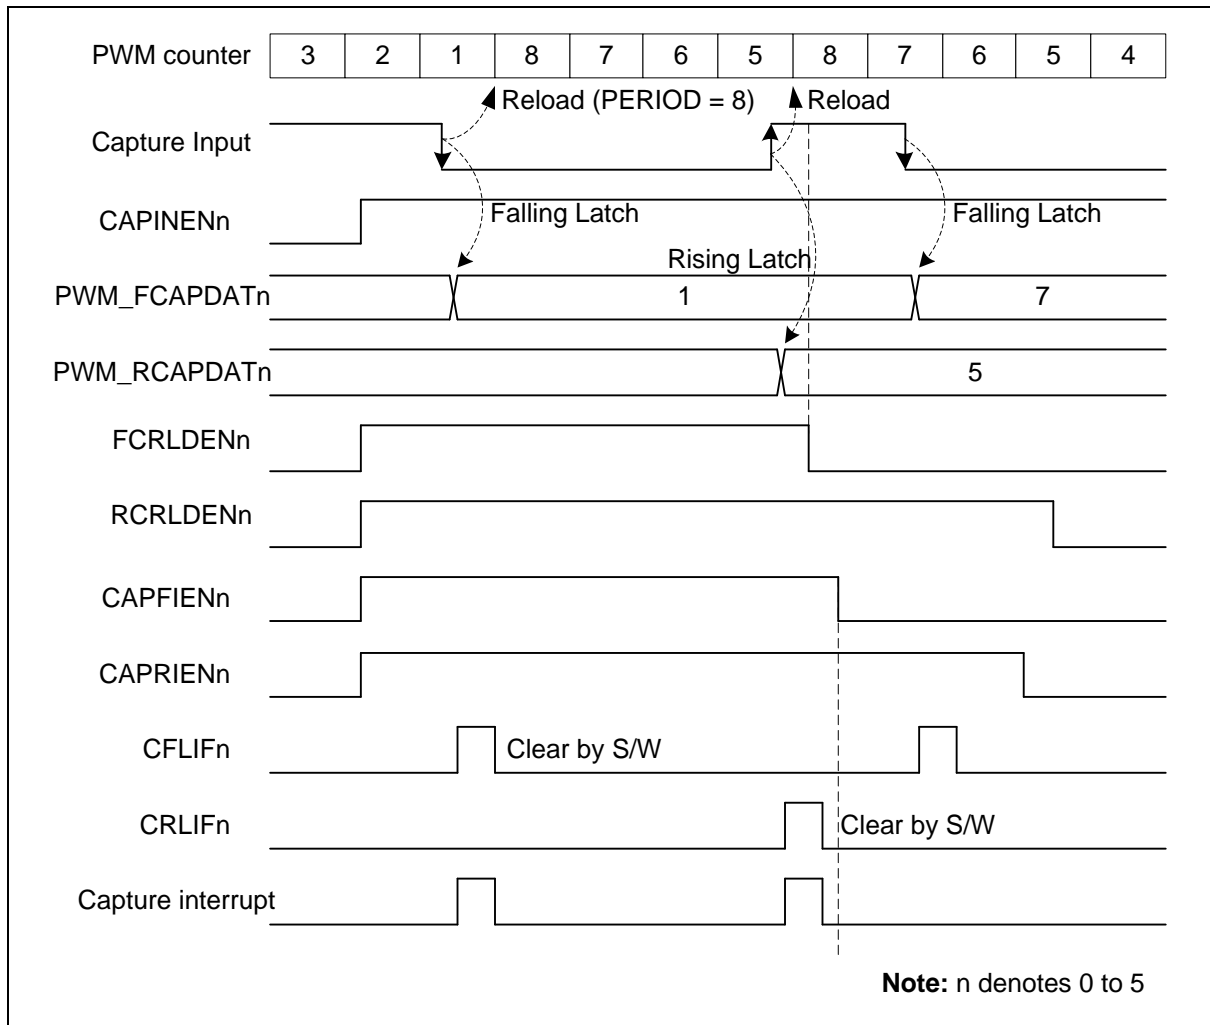

Figure 6.12-35 Capture Operation Waveform

The capture pulse width can be calculated according to the following formula:

For the negative pulse case, the channel low pulse width is calculated as $(PWM_PERIODn + 1 - PWM_RCAPDATn)$ PWM counter time, where one PWM counter time is $(CLKPSC+1) * PWMx_CLK$ clock time. In Figure 6.12-35, the low pulse width is $8+1-5 = 4$ PWM counter time .

For the positive pulse case, the channel high pulse width is calculated as $(PWM_PERIODn + 1 - PWM_FCAPDATn)$ PWM counter time, where one PWM counter time is $(CLKPSC+1) * PWMx_CLK$ clock time. In Figure 6.12-35, the high pulse width is $8+1-7 = 2$ PWM counter time.

6.12.5.25 Capture PDMA Function

The PWM module supports the PDMA transfer function when operating in the capture mode. When the corresponding PDMA enable bit CHENn_m (CHEN0_1 at PWM_PDMACTL[0], CHEN2_3 at PWM_PDMACTL[8] and CHEN4_5 at PWM_PDMACTL[16], where n and m denote complement pair channels) is set, the capture module will issue a request to PDMA controller when the preceding capture event has happened. The PDMA controller will issue an acknowledgement to the capture module after it has read back the CAPBUF (PWM_PDMACAPn_m[15:0], n, m denotes complement pair channels) register in the capture module and has sent the register value to the memory. By setting CAPMODn_m (CAPMOD0_1 at PWM_PDMACTL[2:1], CAPMOD2_3 at PWM_PDMACTL[10:9] and CAPMOD4_5 at PWM_PDMACTL[18:17]) bits, the PDMA can transfer the rising edge captured data or falling edge captured data or both of them to the memory. When using the PDMA to transfer both of the falling and rising edge data, remember to set CAPORDn_m (CAPORD0_1 at PWM_PDMACTL[3], CAPORD2_3 at

PWM_PDMACTL[11] and CAPORD4_5 at PWM_PDMACTL[19]) bit to decide the order of the transferred data (falling edge captured is first or rising edge captured first). The complement pair channels share a PDMA channel. Therefore, a selection bit CHSELn_m (CHSEL0_1 (PWM_PDMACTL[4]), CHSEL2_3 (PWM_PDMACTL[12]) and CHSEL4_5 (PWM_PDMACTL[20])) bit is used to decide either channel n or channel m can be serviced by the PDMA channel.

Figure 6.12-36 is capture PDMA waveform. In this case, the CHSEL0_1 (PWM_PDMACTL[4]) bit is set to 0. Hence the PDMA will service channel 0 for the capture data transfer. CAPMOD0_1 (PWM_PDMACTL[2:1]) bits are set to 3. That means both of the rising and falling edge captured data will be transferred to the memory. The CAPORD0_1 (PWM_PDMACTL[3]) is set to 1, so the rising edge data will be the first data to transfer and following is the falling edge data to transfer. As shown in Figure 6.12-36, the last assertions of the CAPRIF0 CRLIF0 and CAPFIF0 CFLIF0 signal have some overlap. The PWM_RCAPDAT0 value 11 will be loaded to PWM_PDMACAP0_1 register to wait for transfer but not the PWM_FCAPDAT0 value 6. The PWM_PDMACAP0_1 register saves the data which will be transferred to the memory by PDMA. The HWDATA in this figure denotes the data which are being transferred by PDMA.

6.12.7 Register Description

PWM Control Register 0 (PWM_CTL0)

Register	Offset	R/W	Description	Reset Value
PWM_CTL0	PWMx_BA+0x00	R/W	PWM Control Register 0	0x0000_0000

31	30	29	28	27	26	25	24
DBGTRIOFF	DBGHALT	Reserved					
23	22	21	20	19	18	17	16
Reserved		IMMLDEN5	IMMLDEN4	IMMLDEN3	IMMLDEN2	IMMLDEN1	IMMLDEN0
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved		CTRLD5	CTRLD4	CTRLD3	CTRLD2	CTRLD1	CTRLD0

Bits	Description
[31]	<p>DBGTRIOFF</p> <p>ICE Debug Mode Acknowledge Disable Bit (Write Protect) 0 = ICE debug mode acknowledgement effects PWM output. PWM pin will be forced as tri-state while ICE debug mode acknowledged. 1 = ICE debug mode acknowledgement disabled. PWM pin will keep output no matter ICE debug mode acknowledged or not. Note: This bit is write protected. Refer to SYS_REGLCTL register.</p>
[30]	<p>DBGHALT</p> <p>ICE Debug Mode Counter Halt (Write Protect) If counter halt is enabled, PWM all counters will keep current value until exit ICE debug mode. 0 = ICE debug mode counter halt Disable. 1 = ICE debug mode counter halt Enable. Note: This bit is write protected. Refer to SYS_REGLCTL register.</p>
[29:22]	Reserved.
[n+16] n=0,1...5	<p>IMMLDENn</p> <p>Immediately Load Enable Bits 0 = PERIOD will load to PBUF at the end point of each period. CMPDAT will load to CMPBUF at the end point or center point of each period by setting CTRLDD bit. 1 = PERIOD/CMPDAT will load to PBUF and CMPBUF immediately when software update PERIOD/CMPDAT. Note: If IMMLDENn is enabled, WINLDENn and CTRLDDn will be invalid.</p>
[15:6]	Reserved.
[n] n=0,1...5	<p>CTRLDDn</p> <p>Center Load Enable Bits In up-down counter type, PERIOD will load to PBUF at the end point of each period. CMPDAT will load to CMPBUF at the center point of a period.</p>

PWM Control Register 1 (PWM_CTL1)

Register	Offset	R/W	Description	Reset Value
PWM_CTL1	PWMx_BA+0x04	R/W	PWM Control Register 1	0x0000_0000

31	30	29	28	27	26	25	24
Reserved					OUTMODE4	OUTMODE2	OUTMODE0

6.13 UART Interface Controller (UART)

6.13.1 Overview

The chip provides three channels of Universal Asynchronous Receiver/Transmitters (UART). The UART controller performs Normal Speed UART and supports flow control function. The UART controller performs a serial-to-parallel conversion on data received from the peripheral and a parallel-to-serial conversion on data transmitted from the CPU. Each UART controller channel supports ten types of interrupts. The UART controller also supports IrDA SIR, LIN, RS-485 and Single-wire function modes and auto-baud rate measuring function.

6.13.2 Features

- Full-duplex asynchronous communications
- Separates receive and transmit 16/16 bytes entry FIFO for data payloads
- Supports hardware auto-flow control
- Programmable receiver buffer trigger level
- Supports programmable baud rate generator for each channel individually
- Supports nCTS, incoming data, Received Data FIFO reached threshold and RS-485 Address Match (AAD mode) wake-up function
- Supports 8-bit receiver buffer time-out detection function
- Programmable transmitting data delay time between the last stop and the next START bit by setting DLY (UART_TOUT [15:8])
- Supports Auto-Baud Rate measurement and baud rate compensation function
 - Support 9600 bps for UART_CLK is selected LXT.
- Supports break error, frame error, parity error and receive/transmit buffer overflow detection function
- Fully programmable serial-interface characteristics
 - Programmable number of data bit, 5-, 6-, 7-, 8- bit character
 - Programmable PARITY bit, even, odd, no parity or stick PARITY bit generation and detection
 - Programmable STOP bit, 1, 1.5, or 2 STOP bit generation
- Supports IrDA SIR function mode
 - Supports for 3/16 bit duration for normal mode
- Supports LIN function mode (Only UART0 with LIN function)
 - Supports LIN master/slave mode
 - Supports programmable break generation function for transmitter
 - Supports break detection function for receiver
- Supports RS-485 function mode
 - Supports RS-485 9-bit mode
 - Supports hardware or software enables to program nRTS pin to control RS-485 transmission direction
- Supports PDMA transfer function
- Support Single-wire function mode.

UART Feature	UART0	UART1/UART2	SC_UART	USCI-UART

Even / Odd Parity	√	√	√	√
Stick Bit	√	√	-	-
Note: √= Supported				

Table 6.13-1 UART Feature List

6.13.3 Block Diagram

The UART clock control and block diagram are shown in Figure 6.13-1 and Figure 6.13-2 respectively.

Note: The frequency of UARTx_CLK should not be greater than 30 times HCLK.

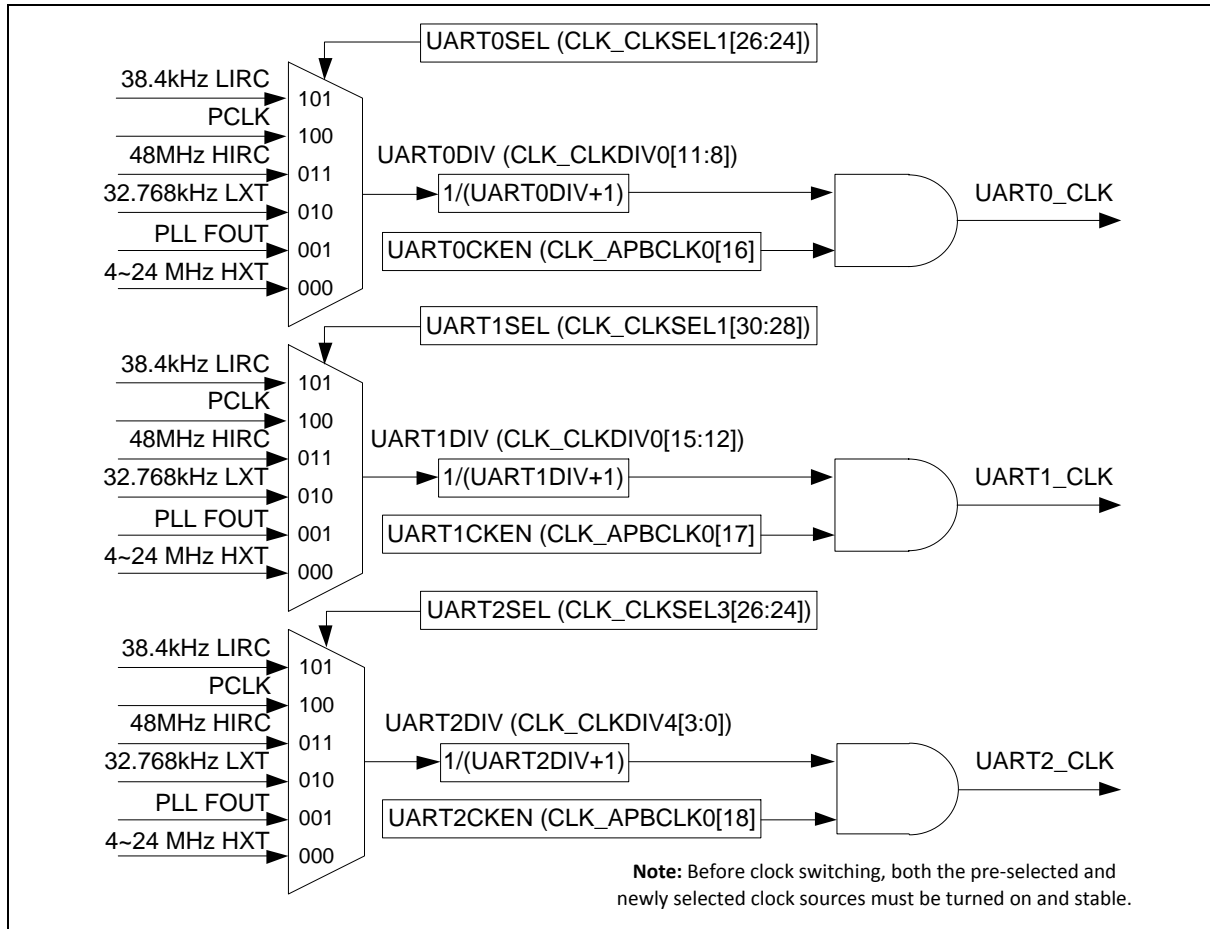

Figure 6.13-1 UART Clock Control Diagram

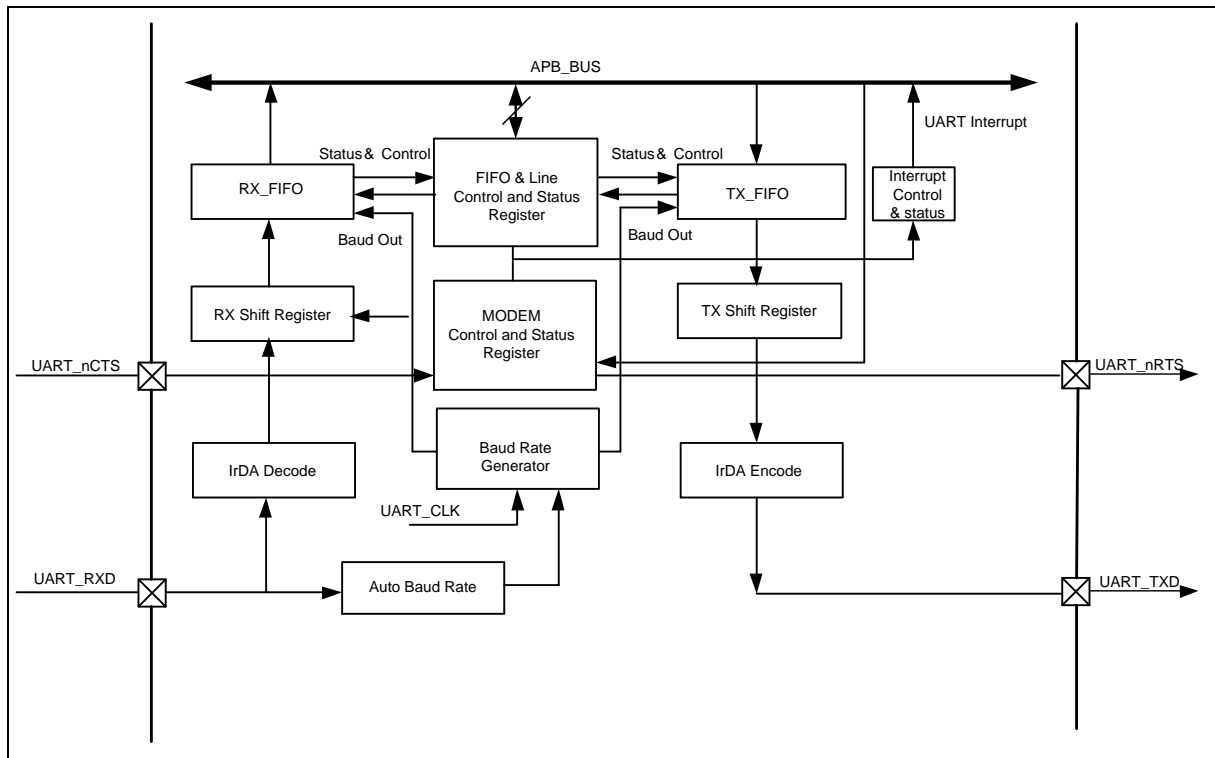

Figure 6.13-2 UART Block Diagram

Each block is described in detail as follows:

TX_FIFO

The transmitter is buffered with a 16 bytes FIFO to reduce the number of interrupts presented to the CPU.

RX_FIFO

The receiver is buffered with a 16 bytes FIFO (plus three error bits, BIF (UART_FIFOSTS[6]), FEF (UART_FIFOSTS[5]), PEF (UART_FIFOSTS[4])) to reduce the number of interrupts presented to the CPU.

TX Shift Register

This block is responsible for shifting out the transmitting data serially.

RX Shift Register

This block is responsible for shifting in the receiving data serially.

Modem Control and Status Register

This register controls the interface to the MODEM or data set (or a peripheral device emulating a MODEM).

Baud Rate Generator

Divide the external clock by the divisor to get the desired baud rate clock. Refer to baud rate equation.

IrDA Encode

This block is IrDA encoding control block.

IrDA Decode

This block is IrDA decoding control block.

FIFO & Line Control and Status Register

This field is register set that including the FIFO control register (UART_FIFO), FIFO status register

(UART_FIFOSTS), and line control register (UART_LINE) for transmitter and receiver. The time-out register (UART_TOUT) identifies the condition of time-out interrupt.

Auto-Baud Rate Measurement

This block is responsible for auto-baud rate measurement.

Interrupt Control and Status Register

There are ten types of interrupts, Receive Data Available Interrupt (RDAINT), Transmit Holding Register Empty Interrupt (THERINT), Transmitter Empty Interrupt (TXENDINT), Receive Line Status Interrupt (parity error or framing error or break interrupt) (RLSINT), MODEM Status Interrupt (MODEMINT), Receiver Buffer Time-out Interrupt (RXTOINT), Buffer Error Interrupt (BUFERRINT), LIN Bus Interrupt (LININT), Wake-up Interrupt (WKINT) and Auto-Baud Rate Interrupt (ABRINT). Interrupt enable register (UART_INTEN) enable or disable the responding interrupt and interrupt status register (UART_INTSTS) identifying the occurrence of the responding interrupt.

Interrupt	Description
RDAINT	Receive Data Available Interrupt.
THERINT	Transmit Holding Register Empty Interrupt.
TXENDINT	Transmitter Empty Interrupt.
RLSINT	Receive Line Status Interrupt (parity error or frame error or break error).
MODEMINT	MODEM Status Interrupt.
RXTOINT	Receiver Buffer Time-out Interrupt.
BUFERRINT	Buffer Error Interrupt.
LININT	LIN Bus Interrupt.
WKINT	Wake-up Interrupt.
ABRINT	Auto-Baud Rate Interrupt.
SWBEINT	Single-wire Bit Error Detect Interrupt.

Table 6.13-2 UART Interrupt

6.13.4 Basic Configuration

The basic configurations of UART0 are as follows:

- Clock Source Configuration
 - Select the source of UART0 peripheral clock on UART0SEL (CLK_CLKSEL1[26:24]).
 - Select the clock divider number of UART0 peripheral clock on UART0DIV (CLK_CLKDIV0[11:8]).
 - Enable UART0 peripheral clock in UART0CKEN (CLK_APBCLK0[16]).
- Reset UART0 controller in UART0RST (SYS_IPRST1[16]).
- Pin Configuration

Group	Pin Name	GPIO	MFP
UART0	UART0_RXD	PA.15, PC.11, PF.2	MFP3
		PF.1	MFP4
		PB.8	MFP5

		PB.12	MFP6	
		PA.0, PA.6	MFP7	
		PA.4	MFP8	
		PD.2	MFP9	
	UART0_TXD		PA.14, PC.12, PF.3	MFP3
			PF.0	MFP4
			PB.9	MFP5
			PB.13	MFP6
			PA.1, PA.7	MFP7
			PA.5	MFP8
			PD.3	MFP9
	UART0_nCTS		PB.11	MFP5
			PB.15	MFP6
			PA.5, PC.7	MFP7
	UART0_nRTS		PB.10	MFP5
PB.14			MFP6	
PA.4, PC.6			MFP7	

The basic configurations of UART1 are as follows:

- Clock Source Configuration
 - Select the source of UART1 peripheral clock on UART1SEL (CLK_CLKSEL1[30:28]).
 - Select the clock divider number of UART1 peripheral clock on UART1DIV (CLK_CLKDIV0[15:12]).
 - Enable UART1 peripheral clock in UART1CKEN (CLK_APBCLK0[17]).
- Reset UART1 controller in UART1RST (SYS_IPRST1[17]).
- Pin Configuration

Group	Pin Name	GPIO	MFP	
UART1	UART1_RXD	PF.1	MFP2	
		PD.6, PD.10	MFP3	
		PB.2, PB.6	MFP6	
		PA.8	MFP7	
		PA.2, PC.8	MFP8	
	UART1_TXD		PF.0	MFP2
			PD.7, PD.11	MFP3
			PB.3, PB.7	MFP6
			PA.9	MFP7
			PA.3, PE.13	MFP8

	UART1_nCTS	PB.9	MFP6
		PA.1, PE.11	MFP8
	UART1_nRTS	PB.8	MFP6
		PA.0, PE.12	MFP8

The basic configurations of UART2 are as follows:

- Clock Source Configuration
 - Select the source of UART2 peripheral clock on UART2SEL (CLK_CLKSEL3[26:24]).
 - Select clock divider number of UART2 peripheral clock on UART2DIV (CLK_CLKDIV4[3:0]).
 - Enable UART2 peripheral clock in UART2CKEN (CLK_APBCLK0[18]).
- Reset UART2 controller in UART2RST (SYS_IPRST1[18]).
- Pin Configuration

Group	Pin Name	GPIO	MFP
UART2	UART2_RXD	PF.5	MFP2
		PE.15	MFP3
		PB.0, PD.12, PE.9	MFP7
		PC.0, PC.4	MFP8
		PB.4	MFP13
	UART2_TXD	PF.4	MFP2
		PE.14	MFP3
		PB.1, PE.8	MFP7
		PC.1, PC.5	MFP8
		PB.5	MFP13
	UART2_nCTS	PD.9, PF.5	MFP4
		PC.2	MFP8
	UART2_nRTS	PD.8, PF.4	MFP4
		PC.3	MFP8

UART Interface Controller Pin description is shown in Table 6.13-3:

Pin	Type	Description
UARTx_TXD	Output	UARTx transmit
UARTx_RXD	Input	UARTx receive
UARTx_nCTS	Input	UARTx modem clear to send
UARTx_nRTS	Output	UARTx modem request to send

Table 6.13-3 UART Interface Controller Pin

6.13.5 Functional Description

The UART controller supports four function modes including UART, IrDA, LIN and RS-485 mode. User can select a function by setting the UART_FUNCSEL register. The four function modes will be described in following section.

6.13.5.1 UART Controller Baud Rate Generator

The UART controller includes a programmable baud rate generator capable of dividing clock input by divisors to produce the serial clock that transmitter and receiver need. Table 6.13-4 list the UART baud rate equations in the various conditions. Table 6.13-5 and Table 6.13-6 list the UART baud rate parameter and register setting example. In IrDA function mode, the baud rate generator must be set in mode 0. More detail register description is shown in UART_BAUD register. There are three setting mode. Mode 0 is set by UART_BAUD[29:28] with 00. Mode 1 is set by UART_BAUD[29:28] with 10. Mode 2 is set by UART_BAUD[29:28] with 11.

Mode	BAUDM1	BAUDM0	Baud Rate Equation
Mode 0	0	0	$UART_CLK / [16 * (BRD+2)]$.
Mode 1	1	0	$UART_CLK / [(EDIVM1+1) * (BRD+2)]$, EDIVM1 must ≥ 8 .
Mode 2	1	1	$UART_CLK / (BRD+2)$. If $UART_CLK \leq 3 * HCLK$, BRD must ≥ 8 . If $UART_CLK > 3 * HCLK$, BRD must $\geq 3 * N - 1$. N is the smallest integer larger than or equal to the ratio of $UART_CLK / HCLK$. For example, if $3 * HCLK < UART_CLK \leq 4 * HCLK$, BRD must ≥ 11 . if $4 * HCLK < UART_CLK \leq 5 * HCLK$, BRD must ≥ 14 . (If the $UART_CLK$ is selected from LXT, BRD can be greater than or equal to 1)

Table 6.13-6 UART controller Baud Rate Register Setting Example Table

6.13.5.2 UART Controller Baud Rate Compensation

The UART controller supports baud rate compensation function. It is used to optimize the precision in each bit. The precision of the compensation is half of UART module clock because there is BRCOMPDEC bit (UART_BRCOMP[31]) to define the positive or negative compensation in each bit. If the BRCOMPDEC (UART_BRCOMP[31]) = 0, it is positive compensation for each bit, one more module clock will be append in the compensated bit. If the BRCOMPDEC (UART_BRCOMP[31]) = 1, it is negative compensation for each bit, decrease one module clock in the compensated bit.

There is 9-bits location, BRCOMP[8:0] (UART_BRCOMP[8:0]), can be configured by user to define the relative bit is compensated or not. BRCOMP[7:0] is used to define the compensation of UART_DAT[7:0] and BRCOMP[8] is used to define the PARITY bit.

Example:

1. UART's peripheral clock = 32.768 kHz and baud rate is 9600 bps

Baud rate is 9600 bps, UART peripheral clock is 32.768 kHz → 3.413 peripheral clock/bit

If the baud divider is set 1 (3 peripheral clock/bit), the inaccuracy of each bit is -0.413 peripheral clock and BRCOMPDEC = 0, so that the BRCOMP (UART_BRCOMP[8:0]) can be set as 9'b010100101 = 0xa5.

Bit	Name	Total INACCURACY	BRCOMP Compensated	Final Inaccuracy
0	START	-0.413	x	-0.413
1	UART_DAT[0]	-0.826(-0.413-0.413)	1	0.174
2	UART_DAT[1]	-0.239(0.174-0.413)	0	-0.239
3	UART_DAT[2]	-0.652(-0.239-0.413)	1	0.348
4	UART_DAT[3]	-0.065(0.348-0.413)	0	-0.065
5	UART_DAT[4]	-0.478(-0.065-0.413)	0	-0.478
6	UART_DAT[5]	-0.891(-0.478-0.413)	1	0.109
7	UART_DAT[6]	-0.304(0.109-0.413)	0	-0.304
8	UART_DAT[7]	-0.717(-0.304-0.413)	1	0.283
9	PARITY	-0.130(0.283-0.413)	0	-0.13

Table 6.13-7 Baud Rate Compensation Example Table 1

2. UART's peripheral clock = 32.768 kHz and baud rate is 4800 bps

Baud rate is 4800 bps, UART peripheral clock is 32.768 kHz → 6.827 peripheral clock/bit

If the baud divider is set 5 (7 peripheral clock/bit), the inaccuracy of each bit is 0.173 peripheral clock and BRCOMPDEC =1, so that the BRCOMP (UART_BRCOMP[8:0]) can be set as 9'b01000010 = 0x82.

Bit	Name	Total INACCURACY	BRCOMP Compensated	Final Inaccuracy
0	START	0.173	x	0.173
1	UART_DAT[0]	0.346(0.173+0.173)	0	0.346
2	UART_DAT[1]	0.519(0.346+0.173)	1	-0.481
3	UART_DAT[2]	-0.308(-0.481+0.173)	0	-0.308
4	UART_DAT[3]	-0.135(-0.308+0.173)	0	-0.135
5	UART_DAT[4]	-0.038(-0.135+0.173)	0	0.038
6	UART_DAT[5]	0.211(0.038+0.173)	0	0.211
7	UART_DAT[6]	0.384(0.211+0.173)	0	0.384
8	UART_DAT[7]	0.557(0.384+0.173)	1	-0.443
9	PARITY	-0.270(-0.443+0.173)	0	-0.270

Table 6.13-8 Baud Rate Compensation Example Table 2

UART Controller Auto-Baud Rate Function Mode:

Auto-Baud Rate function can measure baud rate of receiving data from UART RX pin automatically. When the Auto-Baud Rate measurement is finished, the measuring baud rate is loaded to BRD (UART_BAUD[15:0]). Both of the BAUDM1 (UART_BAUD[29]) and BAUDM0 (UART_BAUD[28]) are set to 1 automatically. UART RX data from START bit to 1st rising edge time is set by 2^{ABRDBITS} bit time in Auto-Baud Rate function detection frame.

2^{ABRDBITS} bit time from START bit to the 1st rising edge is calculated by setting ABRDBITS (UART_ALTCTL[20:19]). Setting ABRDEN (UART_ALTCTL[18]) to enable auto-baud rate function. In beginning stage, the UART RX is kept at 1. Once falling edge is detected, START bit is received. The auto-baud rate counter is reset and starts counting. The auto-baud rate counter will be stop when the 1st rising edge is detected. Then, auto-baud rate counter value divided by ABRDBITS (UART_ALTCTL[20:19]) is loaded to BRD (UART_BAUD[15:0]) automatically. ABRDEN (UART_ALTCTL[18]) is cleared. The Auto-Baud is shown in Figure 6.13-3. Once the auto-baud rate measurement is finished, the ABRDIF (UART_FIFOSTS[1]) is set. When auto-baud rate counter is overflow, ABRDIF (UART_FIFOSTS[1]) or ABRDIF (UART_FIFOSTS[2]) cause the auto-baud rate flag ABRIF(UART_ALTCTL[17]) is generated. If the ABRIEN (UART_INTEN[18]) is enabled, ABRIF(UART_ALTCTL[17]) cause the auto-baud rate interrupt ABRINT (UART_INTSTS[31]) is generated.

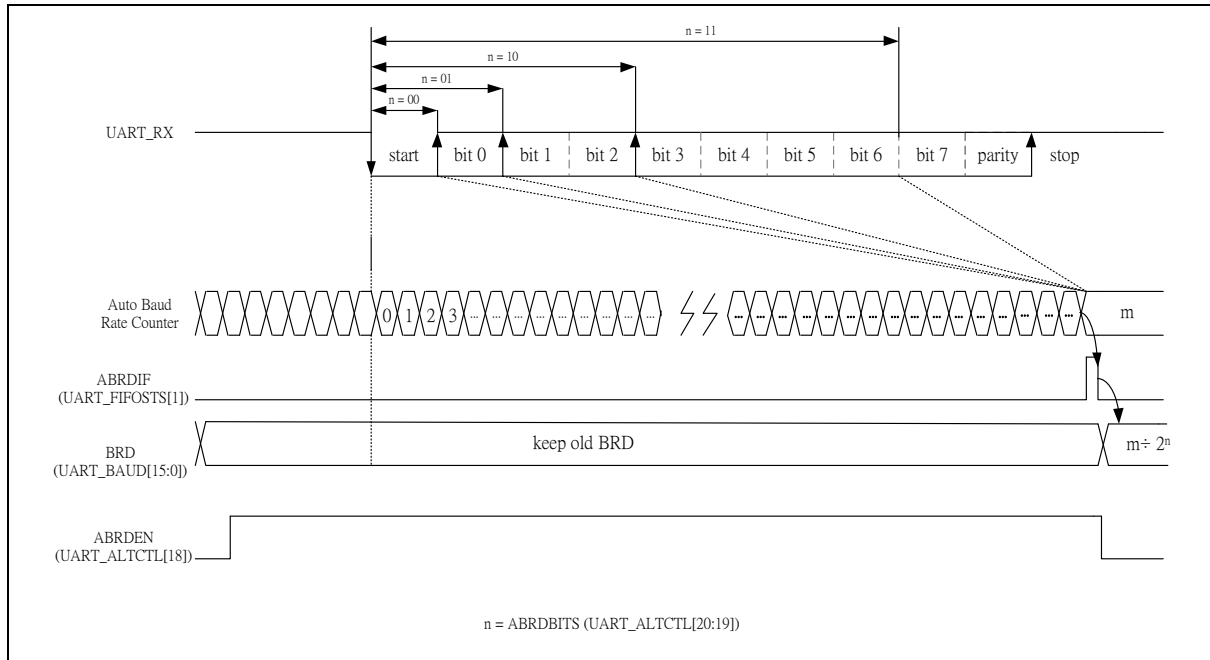

Figure 6.13-3 Auto-Baud Rate Measurement

6.13.5.3 Programming Sequence Example:

1. Program ABRDBITS (UART_ALTCTL[20:19]) to determine UART RX data 1st rising edge time from Start by $2^{ABRDBITS}$ bit time.
2. Set ABRIEN (UART_INTEN[18]) to enable auto-baud rate function interrupt.
3. Set ABRDEN (UART_ALTCTL[18]) to enable auto-baud rate function.
4. ABRDIF (UART_FIFOSTS[1]) is set, the auto-baud rate measurement is finished.
5. Operate UART transmit and receive action.
6. ABRDIOF (UART_FIFOSTS[2]) is set, if auto-baud rate counter is overflow.
7. Go to Step 3.

6.13.5.4 UART Controller Transmit Delay Time Value

The UART controller programs DLY (UART_TOUT [15:8]) to control the transfer delay time between the last STOP bit and next START bit in transmission. The unit is baud. The operation is shown in Figure 6.13-4.

Figure 6.13-4 Transmit Delay Time Operation

6.13.5.5 UART Controller FIFO Control and Status

The UART controller is built-in with a 16 bytes transmitter FIFO (TX_FIFO) and a 16 bytes receiver FIFO (RX_FIFO) that reduces the number of interrupts presented to the CPU. The CPU can read the status of the UART at any time during operation. The reported status information includes condition of the transfer operations being performed by the UART, as well as 3 error conditions (parity error, framing error, break interrupt) occur if receiving data has parity, frame or break error. UART, IrDA, LIN and RS-485 mode support FIFO control and status function.

6.13.5.6 UART Controller Wake-up Function

The UART controller supports wake-up system function. The wake-up function includes nCTS pin, incoming data wake-up, Received Data FIFO reached threshold wake-up, RS-485 Address Match (AAD mode) wake-up and Received Data FIFO threshold time-out wake-up function. CTSWKF (UART_WKSTS[0]), DATWKF (UART_WKSTS[1]), RFRTWKF (UART_WKSTS[2]), RS485WKF (UART_WKSTS[3]) or TOUTWKF (UART_WKSTS[4]) cause the wake-up interrupt flag WKIF(UART_INTSTS[6]) is generated. If the WKIEN (UART_INTEN[6]) is enabled, the wake-up interrupt flag WKIF(UART_INTSTS[6]) cause the wake-up interrupt WKINT (UART_INTSTS[14]) is generated.

nCTS pin wake-up :

When the system is in Power-down mode and WKCTSEN (UART_WKCTL[0]) is set, the toggle of nCTS pin can wake-up system. If the WKCTSEN (UART_WKCTL[0]) is enabled, the toggle of nCTS pin cause the nCTS wake-up flag CTSWKF (UART_WKSTS[0]) is generated. The nCTS wake-up is shown in Figure 6.13-5 and Figure 6.13-6.

nCTS Wake-up Case 1 (nCTS transition from low to high)

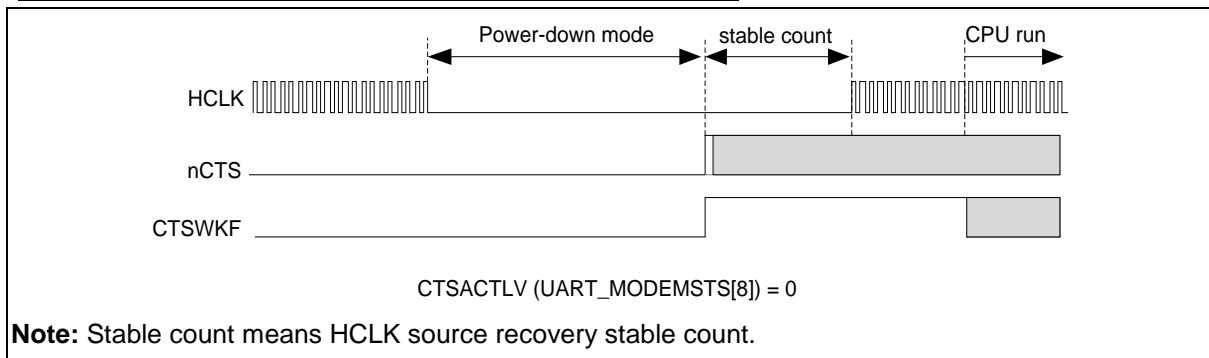

Figure 6.13-5 UART nCTS Wake-up Case1

nCTS Wake-up Case 2 (nCTS transition from high to low)

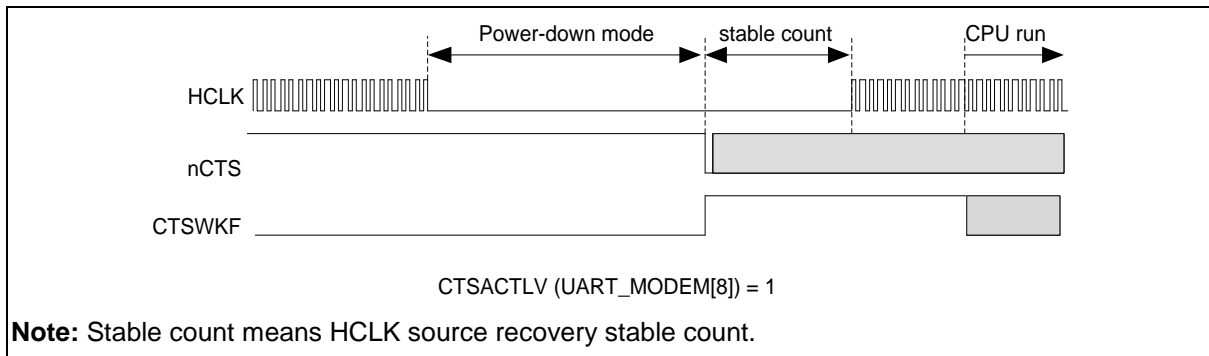

Figure 6.13-6 UART nCTS Wake-up Case2

Incoming Data Wake-up

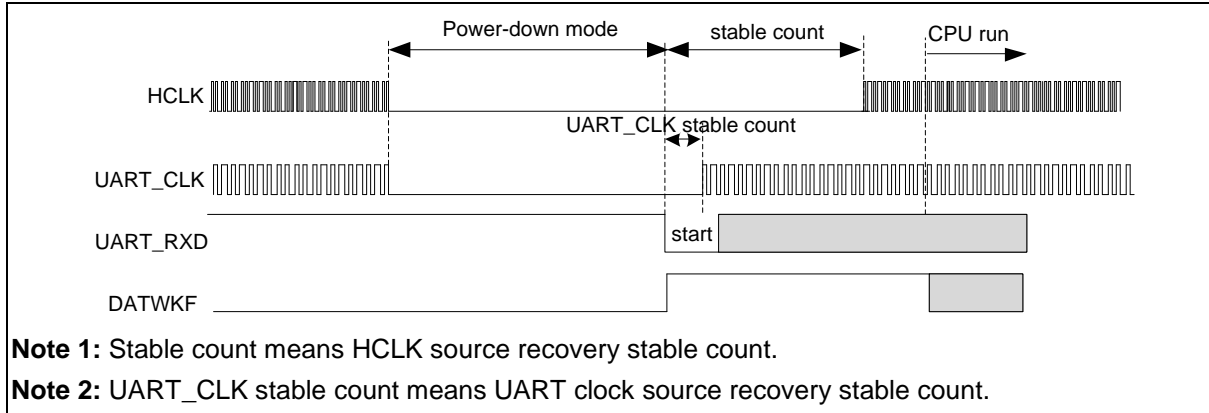

When system is in Power-down mode and the WKDATEN (UART_WKCTL [1]) is set, the toggle of incoming data (UART_RXD) pin can wake-up the system. In order to receive the incoming data after the system wake-up, the STCOMP (UART_DWKCOMP[15:0]) shall be set. These bits field of STCOMP indicate how many clock cycle selected by UART_CLK do the UART controller can get the 1st bit (START bit) when the system is wakeup from Power-down mode.

When incoming data wakes system up, the incoming data will be received and stored in FIFO. If the WKDATEN (UART_WKCTL[1]) is enabled, the toggle of incoming data (UART_RXD) pin cause the incoming data wake-up flag DATWKF (UART_WKSTS[1]) is generated. The incoming data wake-up is

shown in Figure 6.13-7.

Note1: The UART controller clock source should be selected as HIRC, and the compensation time for START bit that refer to the M251 Datasheet for detailed information about wakeup time electrical characteristics. The STCOMP (UART_DWKCOMP[15:0]) = (wake-up stable time) * (HIRC frequency).

Note2: The value of BRD(UART_BAUD[15:0]) should be greater than STCOMP (UART_DWKCOMP[15:0]).

Note 1: Stable count means HCLK source recovery stable count.

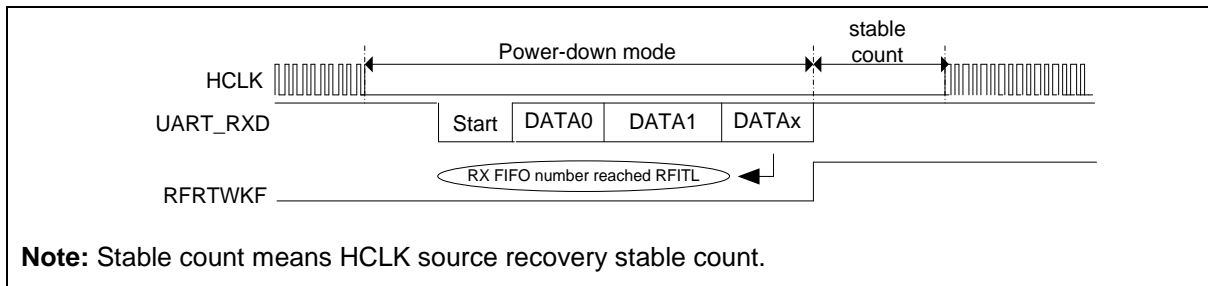

Note 2: UART_CLK stable count means UART clock source recovery stable count.

Figure 6.13-7 UART Data Wake-up

Received Data FIFO Reached Threshold Wake-up

The received data FIFO threshold reached wake-up function is enabled by setting WKFRFTEN (UART_WKCTL[2]). In Power-down mode, when the number of received data in RX FIFO reaches the threshold value RFITL (UART_FIFO[7:4]), it can wake-up the system. If the WKFRFTEN (UART_WKCTL[2]) is enabled, the number of received data in RX FIFO reaches the threshold value RFITL (UART_FIFO[7:4]) cause the received data FIFO reached threshold wake-up flag RFRTWKF (UART_WKSTS[2]) is generated. The Received Data FIFO reached threshold wake-up is shown in Figure 6.13-8.

Note: The UART controller clock source should be selected as LXT in Power-down mode to receive data.

Note: Stable count means HCLK source recovery stable count.

Figure 6.13-8 UART Received Data FIFO reached threshold wake-up

RS-485 Address Match (AAD Mode) Wake-up

The RS-485 address match wake-up function is enabled by setting WKFRFTEN (UART_WKCTL[2]) and WKRS485EN (UART_WKCTL[3]). This function is used for RS-485 Auto Address Detection (AAD) mode in RS-485 function mode and ADDRDN (UART_ALTCTL[15]) is set to 1. In Power-down mode, when an address byte is detected and matches the ADDRNV (UART_ALTCTL[31:24]) or the number of received data in RX FIFO reaches the threshold value RFITL (UART_FIFO[7:4]), it can wake-up the system. If the WKRS485EN (UART_WKCTL[3]) is enabled, when an address byte is detected and matches the ADDRNV (UART_ALTCTL[31:24]) that cause the RS485 address match (AAD mode) wake-up flag RS485WKF (UART_WKSTS[3]) is generated. The RS-485 Address Match (AAD mode) wake-up is shown in Figure 6.13-9.

Note: The UART controller clock source should be selected as LXT in Power-down mode to receive data.

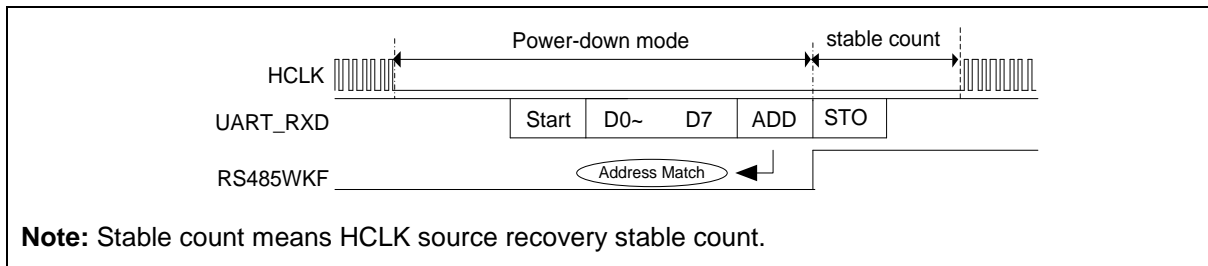

Figure 6.13-9 UART RS-485 AAD Mode Address Match Wake-up

Received Data FIFO Threshold Time-out Wake-up

The received data FIFO threshold time-out wake-up function is enabled by setting WKFRFTEN (UART_WKCTL[2]) and WKTOUEN (UART_WKCTL[4]). Setting TOCNTEN (UART_INTEN[11]) to enable receiver buffer time-out counter. In Power-down mode, when the number of received data in RX FIFO does not reach the threshold value RFITL (UART_FIFO[7:4]) and the time-out counter equals to the time-out value TOIC (UART_TOUT[7:0]), it can wake-up the system. If the WKTOUEN (UART_WKCTL[4]) is enabled, when the time-out counter equals to the time-out value TOIC (UART_TOUT[7:0]) that cause the Received Data FIFO threshold time-out wake-up flag TOUTWKF (UART_WKSTS[4]) is generated. The Received Data FIFO threshold time-out wake-up is shown in Figure 6.13-10.

Note: The UART controller clock source should be selected as LXT in Power-down mode to receive data.

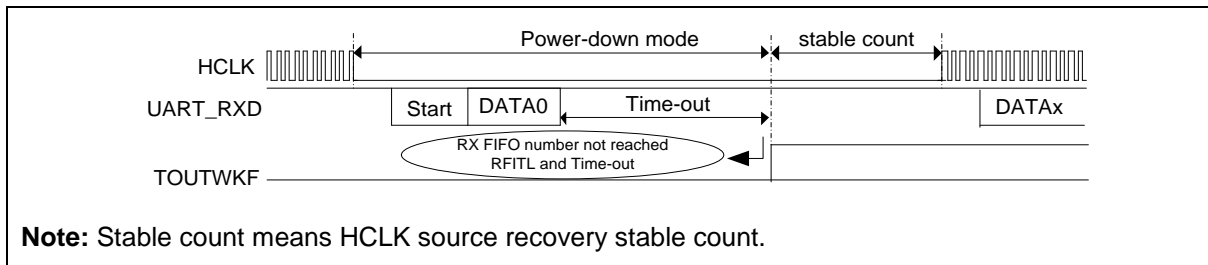

Figure 6.13-10 UART Received Data FIFO threshold time-out wake-up

6.13.5.7 UART Controller Interrupt and Status

Each UART controller supports ten types of interrupts including:

- Receive Data Available Interrupt (RDAlNT)
- Transmit Holding Register Empty Interrupt (THERINT)
- Transmitter Empty Interrupt (TXENDIF)
- Receive Line Status Interrupt (RLSINT)
 - Break Interrupt Flag (BIF)
 - Framing Error Flag (FEF)
 - Parity Error Flag (PEF)
 - RS-485 Address Byte Detect Flag (ADDRDETF)
- MODEM Status Interrupt (MODEMINT)
 - Detect nCTS State Change Flag (CTSDETF)

- Receiver Buffer Time-out Interrupt (RXTOINT)
- Buffer Error Interrupt (BUFERRINT)
 - TX Overflow Error Interrupt Flag (TXOVIF)
 - RX Overflow Error Interrupt Flag (RXOVIF)
- LIN Bus Interrupt (LININT)
 - LIN Break Detection Flag (BRKDETF)
 - Bit Error Detect Status Flag (BITEF)
 - LIN Slave ID Parity Error Flag (SLVIDPEF)
 - LIN Slave Header Error Flag (SLVHEF)
 - LIN Slave Header Detection Flag (SLVHDETF)
- Wake-up Interrupt (WKINT)
 - nCTS Wake-up Flag (CTSWKF)
 - Incoming Data Wake-up Flag (DATWKF)
 - Received Data FIFO Reached Threshold Wake-up Flag (RFRTWKF)
 - RS-485 Address Match (AAD mode) Wake-up Flag (RS485WKF)
 - Received Data FIFO Threshold Time-out Wake-up Flag (TOUTWKF)
- Auto-Baud Rate Interrupt (ABRINT)
 - Auto-baud Rate Detect Interrupt Flag (ABRDIF)
 - Auto-baud Rate Detect Time-out Interrupt Flag (ABRDTOIF)
- Single-wire Bit Error Detect Interrupt (SWBEINT)

Table 6.13-9 describes the interrupt sources and flags. The interrupt is generated when the interrupt flag is generated and the interrupt enable bit is set. User must clear the interrupt flag after the interrupt is generated.

Interrupt Source	Interrupt Indicator	Interrupt Enable Bit	Interrupt Flag	Flag Caused By	Flag Cleared By
Receive Data Available Interrupt	RDAINT	RDAIEN	RDAIF	N/A	Read UART_DAT
Transmit Register Holding Empty Interrupt	THERINT	THREIEN	THREIF	N/A	Write UART_DAT
Transmitter Empty Interrupt	TXENDINT	TXENDIEN	TXENDIF	N/A	Write UART_DAT
Receive Line Status Interrupt	RLSINT	RLSIEN	RLSIF	RLSIF = BIF	Write '1' to BIF
				RLSIF = FEF	Write '1' to FEF
				RLSIF = PEF	Write '1' to PEF
				RLSIF ADDRDETF	Write '1' to ADDRDETF
Modem Status Interrupt	MODEMINT	MODEMIEN	MODEMIF	MODEMIF CTSDETF	Write '1' to CTSDETF
Receiver Buffer Time-out Interrupt	RXTOINT	RXTOIEN	RXTOIF	N/A	Read UART_DAT

Buffer Error Interrupt	BUFERRINT	BUFERRIEN	BUFERRIF	BUFERRIF TXOVIF	= Write '1' to TXOVIF
				BUFERRIF RXOVIF	= Write '1' to RXOVIF
LIN Bus Interrupt	LININT	LINIEN	LINIF	LINIF = BRKDETF	Write '1' to LINIF and Write '1' to BRKDETF
				LINIF = BITEF	Write '1' to LINIF and Write '1' to BITEF
				LINIF = SLVIDPEF	Write '1' to LINIF and Write '1' to SLVIDPEF
				LINIF = SLVHEF	Write '1' to LINIF and Write '1' to SLVHEF
				LINIF = SLVHDETF	Write '1' to LINIF and Write '1' to SLVHDETF
Wake-up Interrupt	WKINT	WKIEN	WKIF	WKIF = CTSWKF	Write '1' to CTSWKF
				WKIF = DATWKF	Write '1' to DATWKF
				WKIF = RFRTWKF	Write '1' to RFRTWKF
				WKIF = RS485WKF	Write '1' to RS485WKF
				WKIF = TOUTWKF	Write '1' to TOUTWKF
Auto-Baud Interrupt Rate	ABRINT	ABRIEN	ABRIF	ABRIF = ABRDIF	Write '1' to ABRDIF
				ABRIF = ABRDIOIF	Write '1' to ABRDIOIF
Single-wire Bit Error Detect Interrupt	SWBEINT	SWBEIEN	SWBEIF	N/A	Writing '1' to SWBEIF

Table 6.13-9 UART controller Interrupt Source and Flag List

6.13.5.8 *UART Function Mode*

The UART controller provides UART function (Setting FUNCSEL (UART_FUNCSEL [1:0]) to '00' to enable UART function mode).

The UART provides full-duplex and asynchronous communications. The transmitter and receiver contain 16 bytes FIFO for payloads. User can program receiver buffer trigger level and receiver buffer time-out detection for receiver. The transmitting data delay time between the last stop and the next START bit can be programmed by setting DLY (UART_TOUT [15:8]) register. The UART supports hardware auto-flow control that provides programmable nRTS flow control trigger level. The number of data bytes in RX FIFO is equal to or greater than RTSTRGLV (UART_FIFO[19:16]), the nRTS is de-asserted.

UART Line Control Function

The UART controller supports fully programmable serial-interface characteristics by setting the

UART_LINE register. User can program UART_LINE register for the word length, STOP bit and PARITY bit setting. Table 6.13-10 and Table 6.13-11 list the UART word, STOP bit length and the PARITY bit settings.

NSB (UART_LINE[2])	WLS (UART_LINE[1:0])	Word Length (Bit)	Stop Length (Bit)
0	00	5	1
0	01	6	1
0	10	7	1
0	11	8	1
1	00	5	1.5
1	01	6	2
1	10	7	2
1	11	8	2

Table 6.13-10 UART Line Control of Word and Stop Length Setting

Parity Type	SPE (UART_LINE[5])	EPE (UART_LINE[4])	PSS (UART_LINE[7])	PBE (UART_LINE[3])	Description
No Parity	x	x	x	0	No PARITY bit output.
Parity source from UART_DATA	x	x	1	1	PARITY bit is generated and checked by software.
Odd Parity	0	0	0	1	Odd Parity is calculated by adding all the "1's" in a data stream and adding a PARITY bit to the total bits, to make the total count an odd number.
Even Parity	0	1	0	1	Even Parity is calculated by adding all the "1's" in a data stream and adding a PARITY bit to the total bits, to make the count an even number.
Forced Mask Parity	1	0	0	1	PARITY bit always logic 1. PARITY bit on the serial byte is set to "1" regardless of total number of "1's" (even or odd counts).
Forced Space Parity	1	1	0	1	PARITY bit always logic 0. PARITY bit on the serial byte is set to "0" regardless of total number of "1's" (even or odd counts).

Table 6.13-11 UART Line Control of PARITY Bit Setting

UART Auto-Flow Control Function

The UART supports auto-flow control function that uses two signals, nCTS (clear-to-send) and nRTS (request-to-send), to control the flow of data transfer between the UART and external devices (e.g. Modem). When auto-flow is enabled, the UART is not allowed to receive data until the UART asserts nRTS to external device. When the number of bytes stored in the RX FIFO equals the value of RTSTRGLV (UART_FIFO [19:16]), the nRTS is de-asserted. The UART sends data out when UART detects nCTS is asserted from external device. If the valid asserted nCTS is not detected, the UART will not send data out. The auto flow control block diagram is shown in Figure 6.13-11.

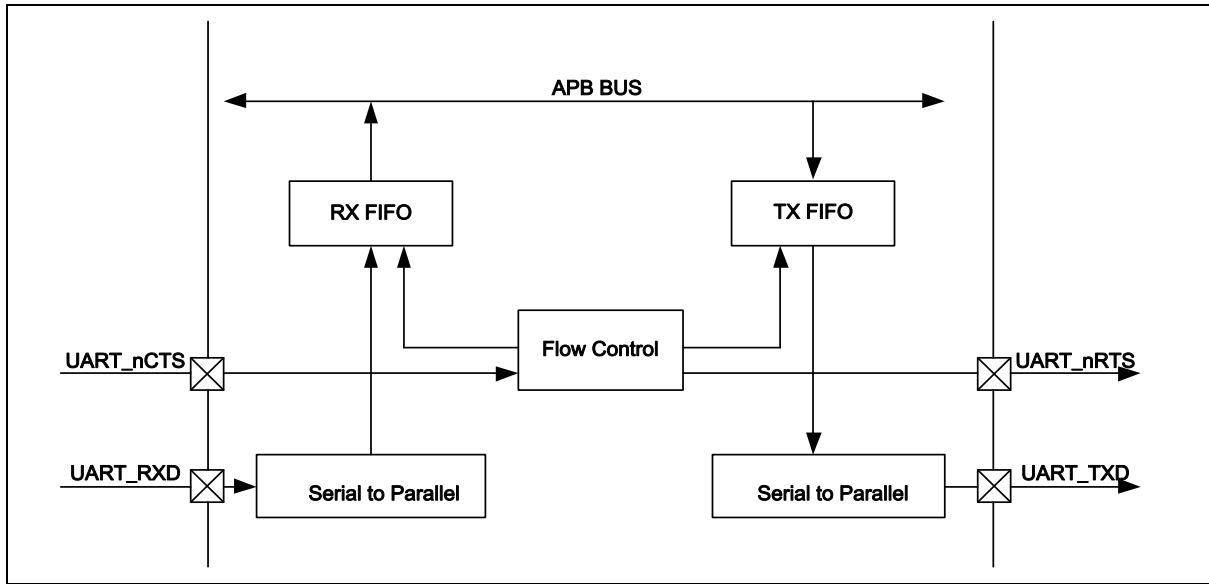

Figure 6.13-11 Auto-Flow Control Block Diagram

Figure 6.13-12 demonstrates the nCTS auto-flow control of UART function mode. User must set ATOCTSEN (UART_INTEN [13]) to enable nCTS auto-flow control function. The CTSACTLV (UART_MODEMSTS [8]) can set nCTS pin input active state. The CTSDETF (UART_MODEMSTS[0]) is set when any state change of nCTS pin input has occurred, and then TX data will be automatically transmitted from TX FIFO.

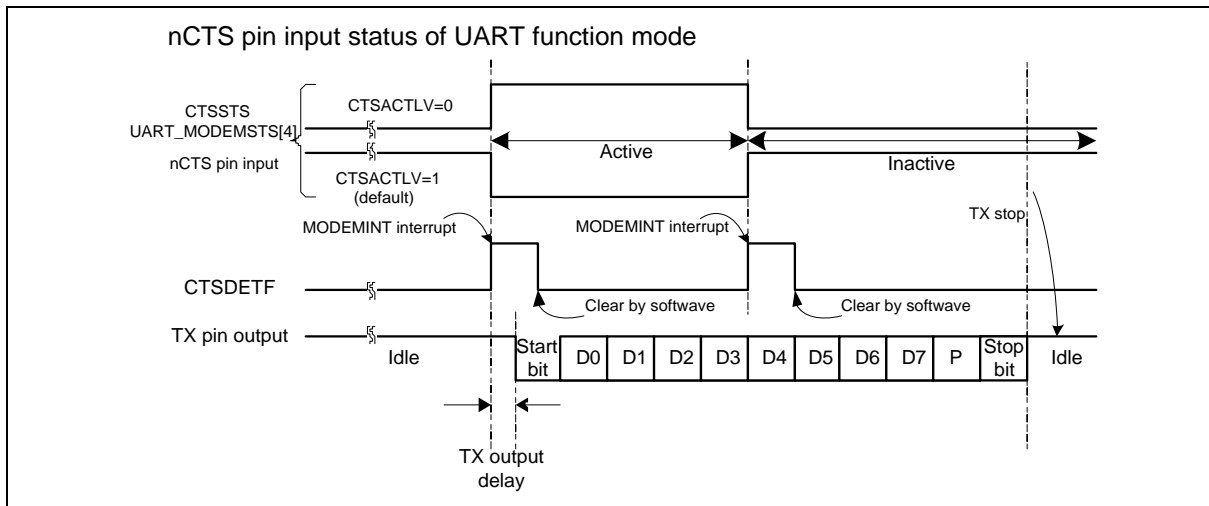

Figure 6.13-12 UART nCTS Auto-Flow Control Enabled

As shown in Figure 6.13-13, in UART nRTS auto-flow control mode (ATORTSEN(UART_INTEN[12])=1), the nRTS internal signal is controlled by UART FIFO controller with RTSTRGLV(UART_FIFO[19:16]) trigger level.

Setting RTSACTLV(UART_MODEM[9]) can control the nRTS pin output is inverse or non-inverse from nRTS signal. User can read the RTSSTS (UART_MODEM[13]) bit to get real nRTS pin output voltage logic status.

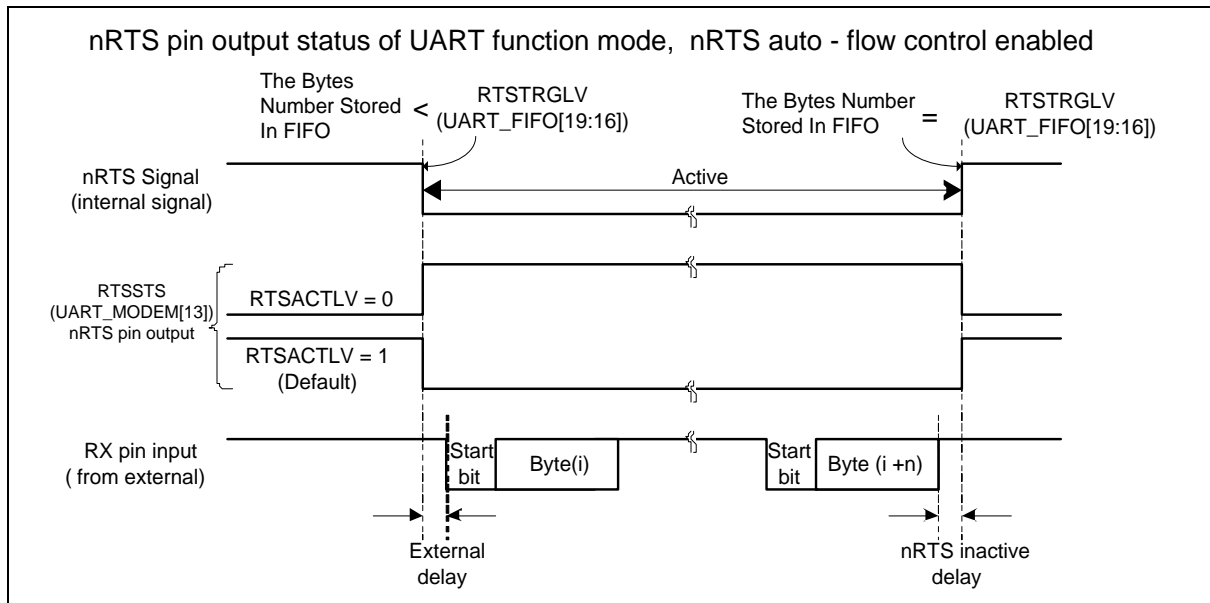

Figure 6.13-13 UART nRTS Auto-Flow Control Enabled

As shown in Figure 6.13-14, in software mode (ATORTSEN(UART_INTEN[12])=0), the nRTS flow is directly controlled by software programming of RTS(UART_MODEM[1]) control bit.

Setting RTSACTLV(UART_MODEM[9]) can control the nRTS pin output is inverse or non-inverse from RTS(UART_MODEM[1]) control bit. User can read the RTSSTS(UART_MODEM[13]) bit to get real nRTS pin output voltage logic status.

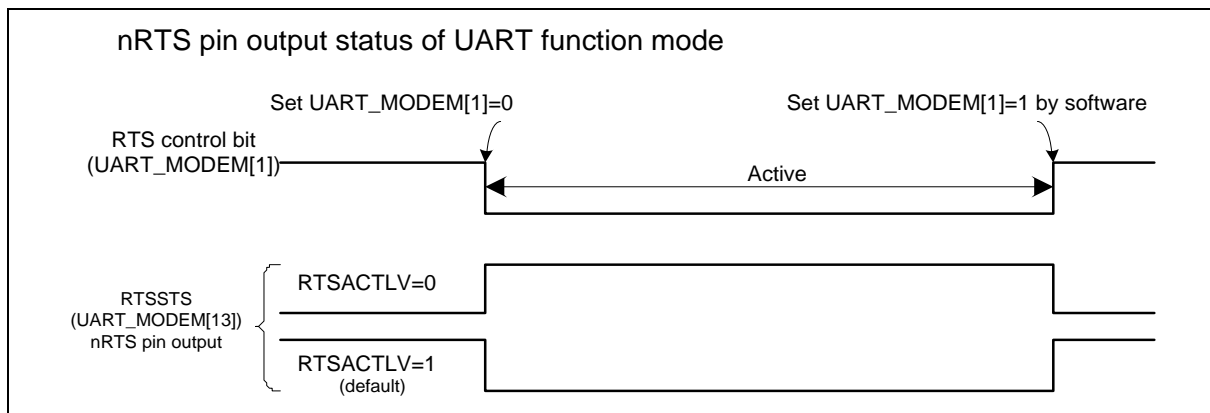

Figure 6.13-14 UART nRTS Auto-Flow with Software Control

6.13.5.9 IrDA Function Mode

The UART controller also provides Serial IrDA (SIR, Serial Infrared) function (Setting UART_FUNCSEL [1:0] to '10' to enable the IrDA function). The SIR specification defines a short-range infrared asynchronous serial transmission mode with one START bit, 8 data bits, and 1 STOP bit. The maximum data rate is 115.2 kbps. The IrDA SIR block contains an IrDA SIR protocol encoder/decoder. The IrDA SIR protocol is half-duplex only. So, it cannot transmit and receive data at the same time. The IrDA SIR physical layer specifies a minimum 10 ms transfer delay between transmission and reception, and this delay feature must be implemented by software.

In IrDA mode, the BAUDM1 (UART_BAUD [29]) must be cleared.

Baud Rate = Clock / (16 * (BRD + 2)), where BRD (UART_BAUD[15:0]) is Baud Rate Divider in UART_BAUD register.

Note: The tolerance of baud-rate is $\pm 5\%$ between IrDA master and IrDA slave.

The IrDA control block diagram is shown in Figure 6.13-15.

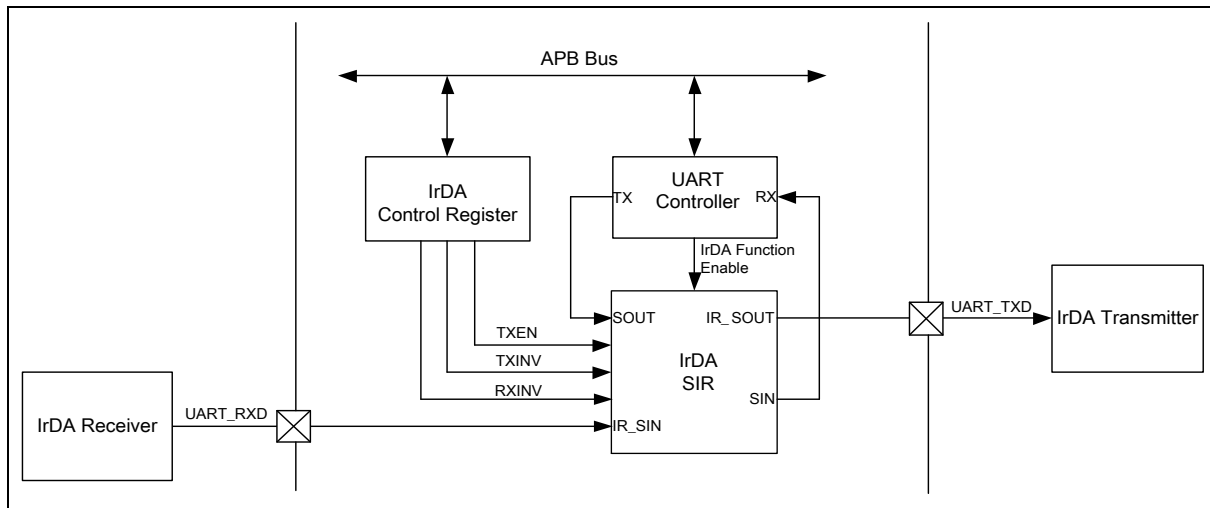

Figure 6.13-15 IrDA Control Block Diagram

IrDA SIR Transmit Encoder

The IrDA SIR Transmit Encoder modulates Non-Return-to-Zero (NRZ) transmit bit stream output from UART. The IrDA SIR physical layer specifies the use of Return-to-Zero, Inverted (RZI) modulation scheme which represents logic 0 as an infra light pulse. The modulated output pulse stream is transmitted to an external output driver and infrared light emitting diode.

The transmitted pulse width is specified as 3/16 period of baud rate.

IrDA SIR Receive Decoder

The IrDA SIR Receive Decoder demodulates the Return-to-Zero bit stream from the input detector and outputs the NRZ serial bits stream to the UART received data input.

In idle state, the decoder input is high. A START bit is detected when the decoder input is LOW. In normal operation, the RXINV (UART_IRDA[6]) is set to '1' and TXINV (UART_IRDA[5]) is set to '0'.

IrDA SIR Operation

The IrDA SIR encoder/decoder provides functionality which converts between UART data stream and half-duplex serial SIR interface. Figure 6.13-16 is IrDA encoder/decoder waveform.

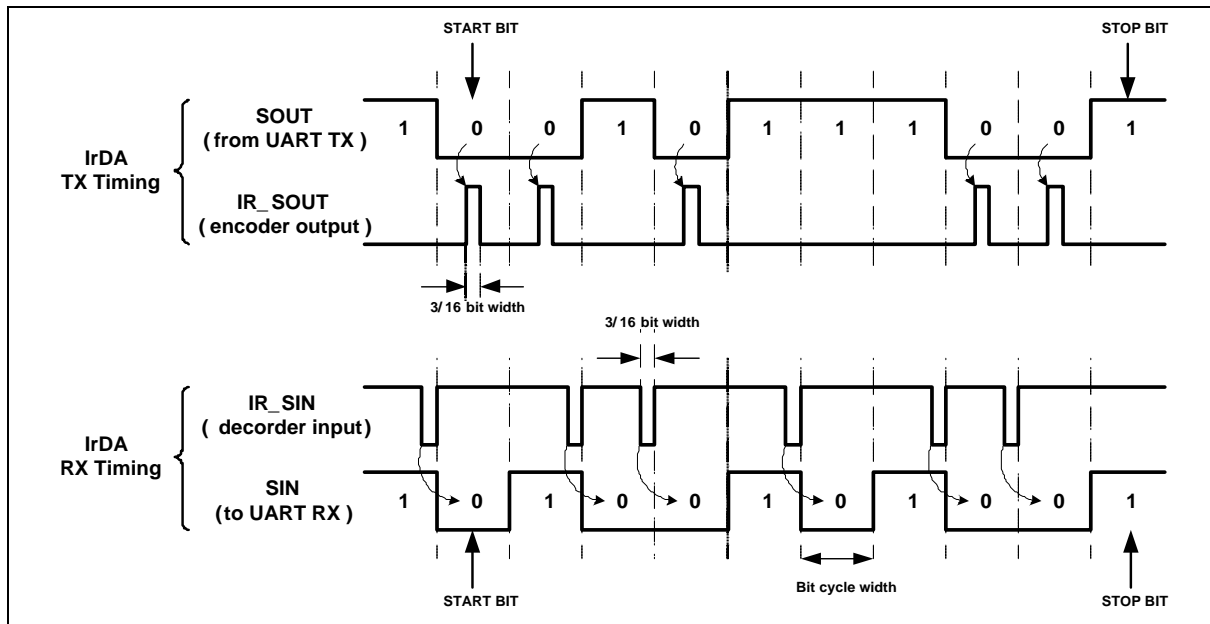

Figure 6.13-16 IrDA TX/RX Timing Diagram

6.13.5.10 LIN Function Mode (Local Interconnection Network)

The UART Controller supports LIN function. Setting FUNCSEL (UART_FUNCSEL[1:0]) to '01' to select LIN mode operation. The UART Controller supports LIN break/delimiter generation and break/delimiter detection in LIN master mode, and supports header detection and automatic resynchronization in LIN Slave mode.

Structure of LIN Frame

According to the LIN protocol, all information transmitted is packed as frames; a frame consists of a header (provided by the master task) and a response (provided by a slave task). The header (provided by the master task) consists of a break field and a synch field followed by a frame identifier (frame ID). The frame identifier uniquely defines the purpose of the frame. The slave task is appointed for providing the response associated with the frame ID. The response consists of a data field and a checksum field. Figure 6.13-17 is the structure of LIN Frame.

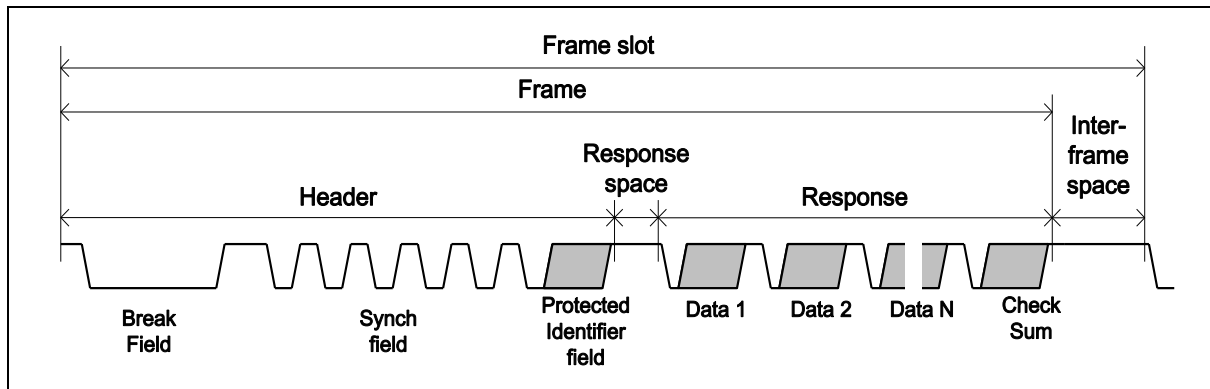

Figure 6.13-17 Structure of LIN Frame

Structure of LIN Byte

In LIN mode, each byte field is initiated by a START bit with value 0 (dominant), followed by 8 data bits and no PARITY bit, LSB is first and ended by 1 STOP bit with value 1 (recessive) in accordance with the LIN standard. The structure of Byte is shown in Figure 6.13-18.

Figure 6.13-18 Structure of LIN Byte

LIN Master Mode

The UART Controller supports LIN Master mode. To enable and initialize the LIN Master mode, the following steps are necessary:

1. Set the UART_BAUD register to select the desired baud rate.
2. Set WLS (UART_LINE[1:0]) to '11' to configure the word length with 8 bits, clearing PBE (UART_LINE[3]) bit to disable parity check and clearing NSB (UART_LINE[2]) bit to configure with one STOP bit.
3. Set FUNCSEL (UART_FUNCSEL[1:0]) to '01' to select LIN function mode operation.

A complete header consists of a break field and sync field followed by a frame identifier (frame ID). The UART controller can be selected header sending by three header selected modes. The header selected mode can be “break field” or “break field and sync field” or “break field, sync field and frame ID field” by setting HSEL (UART_LINCTL[23:22]). If the selected header is “break field”, software must handle the following sequence to send a complete header to bus by filling sync data (0x55) and frame ID data to the UART_DAT register. If the selected header is “break field and sync field”, software must handle the sequence to send a complete header to bus by filling the frame ID data to UART_DAT register, and if the selected header is “break field, sync field and frame ID field”, hardware will control the header sending sequence automatically but software must filled frame ID data to PID (UART_LINCTL [31:24]). When operating in header selected mode in which the selected header is “break field, sync field and frame ID field”, the frame ID PARITY bit can be calculated by software or hardware depending whether the IDPEN (UART_LINCTL[9]) bit is set or not.

HSEL	Break Field	Sync Field	ID Field
0	Generated by Hardware	Handled by Software	Handled by Software
1	Generated by Hardware	Generated by Hardware	Handled by Software
2	Generated by Hardware	Generated by Hardware	Generated by Hardware (But Software needs to fill ID to PID (UART_LINCTL[31:24]) first)

Table 6.13-12 LIN Header Selection in Master Mode

When UART is operated in LIN data transmission, LIN bus transfer state can be monitored by hardware or software. User can enable hardware monitoring by setting BITERRREN (UART_LINCTL [12]) to “1”, if the input pin (UART_RX) state is not equal to the output pin (UART_TX) state in LIN transmitter state that hardware will generate an interrupt to CPU. Software can also monitor the LIN bus transfer state by checking the read back data in UART_DAT register. The following sequence is a program sequence example.

The procedure without software error monitoring in Master mode:

1. Fill Protected Identifier to PID (UART_LINCTL[31:24]).
2. Select the hardware transmission header field including “break field + sync field + protected identifier field” by setting HSEL (UART_LINCTL [23:22]) to “10”.
3. Set SENDH (UART_LINCTL[8]) bit to 1 for requesting header transmission.
4. Wait until SENDH (UART_LINCTL[8]) bit cleared by hardware.

5. Wait until TXEMPTYF (UART_FIFOSTS[28]) set to 1 by hardware.

Note1: The default setting of break field is 12 dominant bits (break field) and 1 recessive bit break/sync delimiter. Setting BRKFL (UART_LINCTL [19:16]) and BSL (UART_LINCTL[21:20]) to change the LIN break field length and break/sync delimiter length.

Note2: The default setting of break/sync delimiter length is 1-bit time and the inter-byte spaces default setting is also 1-bit time. Setting BSL (UART_LINCTL[21:20]) and DLY(UART_TOUT[15:8]) can change break/sync delimiter length and inter-byte spaces.

Note3: If the header includes the “break field, sync field and frame ID field”, software must fill frame ID to PID (UART_LINCTL[31:24]) before trigger header transmission (setting the SENDH (UART_LINCTL[8])). The frame ID parity can be generated by software or hardware depending on IDPEN (UART_LINCTL[9]) setting. If the parity generated by software with IDPEN (UART_LINCTL[9]) is set to ‘0’, software must fill 8 bit data (include 2 bit parity) in this field. If the parity generated by hardware with IDPEN (UART_LINCTL[9]) is set to ‘1’, software fills ID0~ID5 and hardware calculates P0 and P1.

Procedure with software error monitoring in Master mode:

1. Choose the hardware transmission header field to only include “break field” by setting HSEL (UART_LINCTL [23:22]) to ‘00’.
2. Enable break detection function by setting BRKDETEN (UART_LINCTL[10]).
3. Request break + break/sync delimiter transmission by setting the SENDH (UART_LINCTL[8]).
4. Wait until the BRKDETF (UART_LINSTS[8]) flag is set to “1” by hardware.
5. Request sync field transmission by writing 0x55 into UART_DAT register.
6. Wait until the RDAIF (UART_INTSTS[0]) is set to “1” by hardware and then read back the UART_DAT register.
7. Request header frame ID transmission by writing the protected identifier value to UART_DAT register.
8. Wait until the RDAIF (UART_INTSTS[0]) is set to “1” by hardware and then read back the UART_DAT register.

LIN Break and Delimiter Detection

When software enables the break detection function by setting BRKDETEN (UART_LINCTL[10]), the break detection circuit is activated. The break detection circuit is totally independent from the UART receiver.

When the break detection function is enabled, the circuit looks at the input UART_RX pin for a start signal. If UART LIN controller detects consecutive dominant is greater than 11 bits dominant followed by a recessive bit (delimiter), the BRKDETF (UART_LINSTS[8]) flag is set at the end of break field. If the LINIEN (UART_INTEN[8]) bit is set to 1, an interrupt LININT (UART_INTSTS[15]) will be generated. The behavior of the break detection and break flag are shown in Figure 6.13-19.

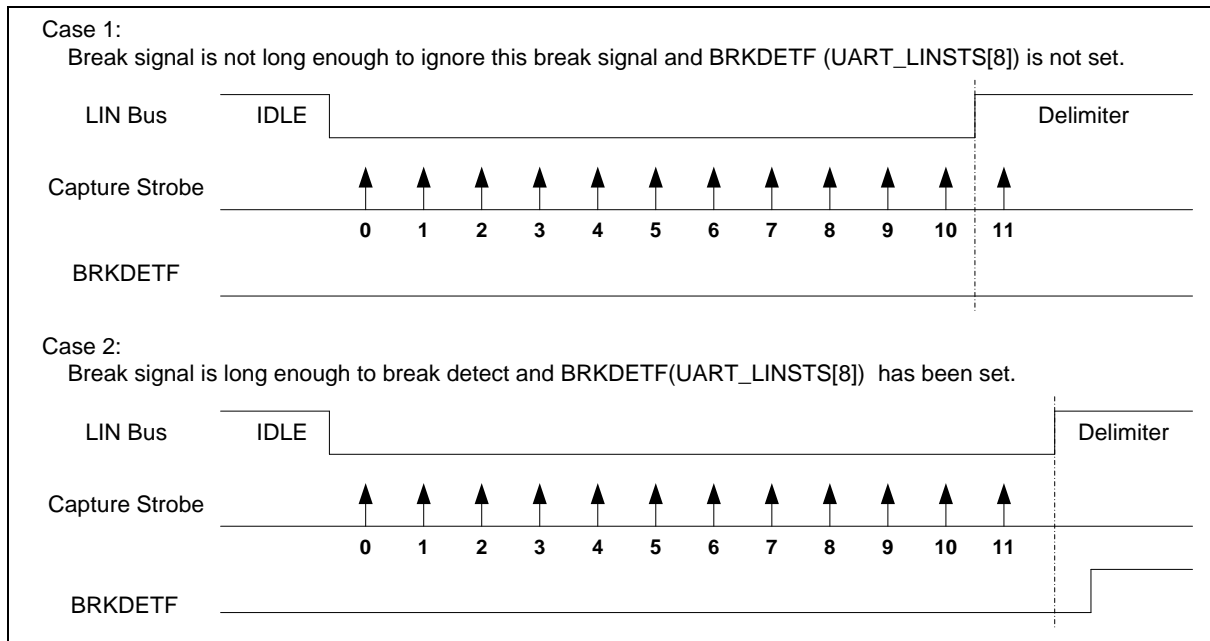

Figure 6.13-19 Break Detection in LIN Mode

LIN Frame ID and Parity Format

The LIN frame ID value in LIN function mode is shown, the frame ID parity can be generated by software or hardware depends on IDPEN (UART_LINCTL[9]).

If the parity generated by hardware (IDPEN (UART_LINCTL[9])=1), user fill ID0~ID5 (UART_LINCTL [29:24]) hardware will calculate P0 (UART_LINCTL[30]) and P1 (UART_LINCTL[31]) otherwise user must filled frame ID and parity in this field.

Figure 6.13-20 LIN Frame ID and Parity Format

LIN Slave Mode

The UART Controller supports LIN Slave mode. To enable and initialize the LIN Slave mode, the following steps are necessary:

1. Set the UART_BAUD register to select the desired baud rate.
2. Configure the data length to 8 bits by setting WLS (UART_LINE[1:0]) to '11' and disable parity check by clearing PBE (UART_LINE[3]) bit and configure with one STOP bit by clearing NSB (UART_LINE[2]) bit.
3. Select LIN function mode by setting FUNCSEL (UART_FUNCSEL[1:0]) to '01'.
4. Enable LIN slave mode by setting the SLVEN (UART_LINCTL[0]) to 1.

LIN Header Reception

According to the LIN protocol, a slave node must wait for a valid header which comes from the master node. Next the slave task will take one of following actions (depend on the master header frame ID value).

- Receive the response.
- Transmit the response.
- Ignore the response and wait for next header.

In LIN Slave mode, user can enable the slave header detection function by setting the SLVHDEN (UART_LINCTL[1]) to detect complete frame header (receive “break field”, “sync field” and “frame ID field”). When a LIN header is received, the SLVHDEF (UART_LINSTS[0]) flag will be set. If the LINIEN (UART_INTEN[8]) bit is set to 1, an interrupt will be generated. User can enable the frame ID parity check function by setting IDPEN (UART_LINCTL[9]). If only received frame ID parity is not correct (break and sync field are correct), the SLVIDPEF (UART_LINSTS[2]) flag is set to ‘1’. If the LINIEN (UART_INTEN[8]) is set to 1, an interrupt will be generated and SLVHDEF (UART_LINSTS[0]) is set to ‘1’. User can also put LIN in mute mode by setting MUTE (UART_LINCTL[4]) to ‘1’. This mode allows detection of headers only (break + sync + frame ID) and prevents the reception of any other characters. In order to avoid bit rate tolerance, the controller supports automatic resynchronization function to avoid clock deviation error, user can enable this feature by setting SLVAREN (UART_LINCTL[2]).

LIN Response Transmission

The LIN slave node can transmit response and receive response. When slave node is the publisher of the response, the slave node sends response by filling data to the UART_DAT register. If the slave node is the subscriber of the response, the slave node receives data from LIN bus.

LIN Header Time-out Error

The LIN slave controller contains a header time-out counter. If the entire header is not received within the maximum time limit of 57 bit times, the header error flag SLVHEF (UART_LINSTS [1]) will be set. The time-out counter is enabled at each break detect edge and stopped in the following conditions.

- A LIN frame ID field has been received.
- The header error flag asserts.
- Writing 1 to the SLVSYNCF (UART_LINSTS[3]) to re-search a new frame header.

Mute Mode and LIN Exit from Mute Mode Condition

In Mute mode, a LIN slave node will not receive any data until specified condition occurred. It allows header detection only and prevents the reception of any other characters. User can enable Mute mode by setting the MUTE (UART_LINCTL[4]) and exiting from Mute mode condition can be selected by HSEL (UART_LINCTL[23:22]).

Note: It is recommended to set LIN slave node to Mute mode after checksum transmission.

The LIN slave controller exiting from Mute mode is described as follows: If HSEL (UART_LINCTL[23:22]) is set to “break field”, when LIN slave controller detects a valid LIN break + delimiter, the controller will enable the receiver (exit from Mute mode) and subsequent data (sync data, frame ID data, response data) are received in RX FIFO.

If HSEL (UART_LINCTL[23:22]) is set to “break field and sync field”, when the LIN slave controller detects a valid LIN break + delimiter followed by a valid sync field without frame error, the controller will enable the receiver (exit from mute mode) and subsequent data (ID data, response data) are received in RX FIFO. If HSEL (UART_LINCTL[23:22]) is set to “break field, sync field and ID field”, when the LIN slave controller detects a valid LIN break + delimiter and valid sync field without frame error followed by ID data without frame error and received ID data matched PID (UART_LINCTL[31:24]) value. The controller will enable the receiver (exit from mute mode) and subsequent data (response data) are received in RX FIFO.

Slave Mode Non-automatic Resynchronization (NAR)

User can disable the automatic resynchronization function to fix the communication baud rate. When operating in Non-Automatic Resynchronization mode, software needs some initial process, and the

initialization process flow of Non-Automatic Resynchronization mode is shown as follows:

1. Select the desired baud rate by setting the UART_BAUD register.
2. Select LIN function mode by setting FUNCSEL (UART_FUNCSEL[1:0]) to '01'.
3. Disable automatic resynchronization function by setting SLVAREN (UART_LINCTL[2]) is set to 0.
4. Enable LIN slave mode by setting the SLVEN (UART_LINCTL[0]) is set to 1.

Slave Mode with Automatic Resynchronization (AR)

In Automatic Resynchronization (AR) mode, the controller will adjust the baud rate generator after each sync field reception. The initialization process flow of Automatic Resynchronization mode is shown as follows:

1. Select the desired baud rate by setting the UART_BAUD register.
2. Select LIN function mode by setting UART_FUNCSEL (UART_FUNCSEL[1:0]) to '01'.
3. Enable automatic resynchronization function by setting SLVAREN (UART_LINCTL[2]) to '1'.
4. Enable LIN slave mode by setting the SLVEN (UART_LINCTL[0]) is set to '1'.

When the automatic resynchronization function is enabled, after each LIN break field, the time duration between five falling edges is sampled on peripheral clock and the result of this measurement is stored in an internal 13-bit register and the UART_BAUD register value will be automatically updated at the end of the fifth falling edge. If the measure timer (13-bit) overflows before five falling edges, then the header error flag SLVHEF (UART_LINSTS [1]) will be set.

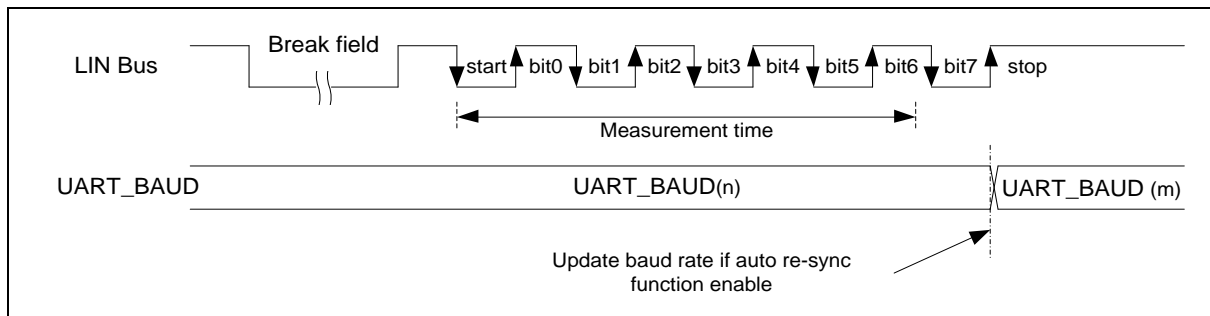

Figure 6.13-21 LIN Sync Field Measurement

When operating in Automatic Resynchronization (AR) mode, software must select the desired baud rate by setting the UART_BAUD register and hardware will store it at internal TEMP_REG register, after each LIN break field, the time duration between five falling edges is sampled on peripheral clock and the result of this measurement is stored in an internal 13-bit register BAUD_LIN and the result will be updated to UART_BAUD register automatically.

To guarantee the transmission baud rate, the baud rate generator must reload the initial value before each new break reception. The initial value is programmed by the application during initialization (TEMP_REG). User can set SLVDUEN (UART_LINCTL [3]) to enable auto reload initial baud rate value function. If the SLVDUEN (UART_LINCTL [3]) is set, when received the next character, hardware will auto reload the initial value to UART_BAUD, and when the UART_BAUD be updated, the SLVDUEN (UART_LINCTL [3]) will be cleared automatically. The behavior of LIN updated method as shown Figure 6.13-22.

Note1: It is recommended to set the SLVDUEN bit before every checksum reception.

Note2: When a header error is detected, user must write 1 to SLVSYNCF (UART_LINSTS[3]) to re-search new frame header. When writing 1 to it, hardware will reload the initial baud rate TEMP_REG and re-search new frame header.

Note3: When operating in Automatic Resynchronization mode, the baud rate setting must be operated at mode2 (BAUDM1 (UART_BAUD [29]) and BAUDM0 (UART_BAUD[28]) must be 1).

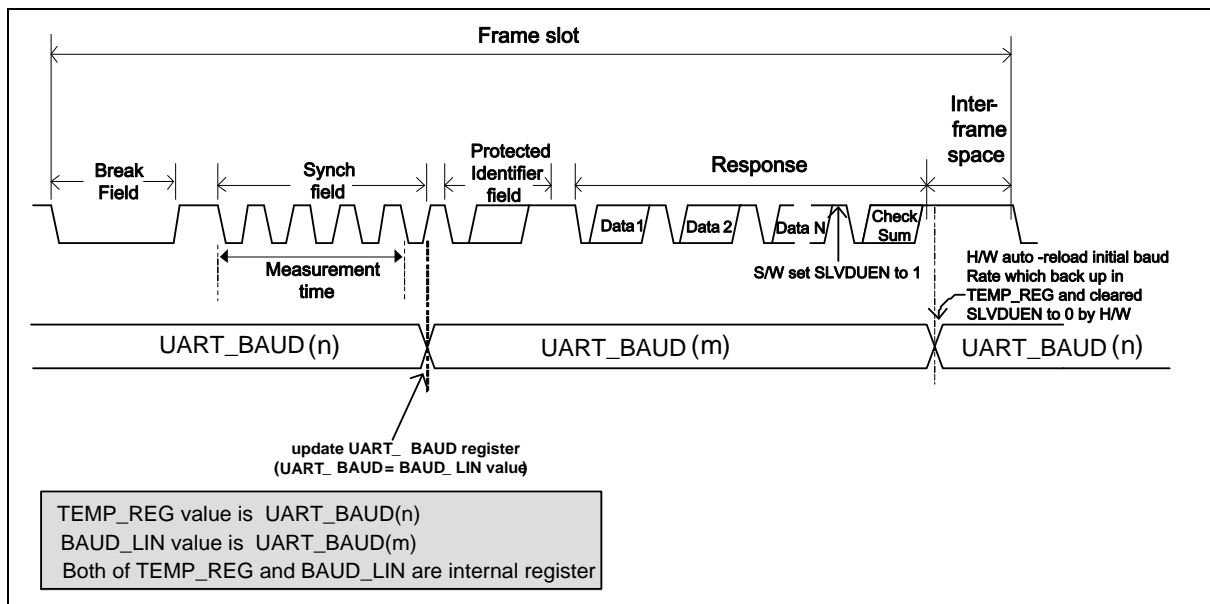

Figure 6.13-22 UART_BAUD Update Sequence in AR mode if SLVDUEN is 1

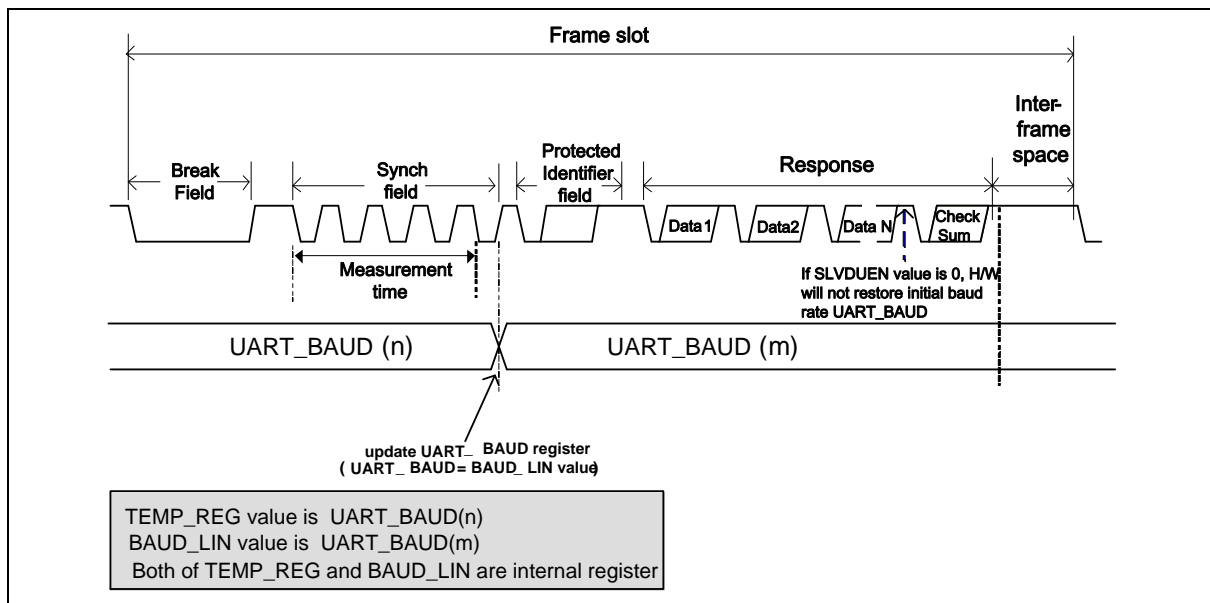

Figure 6.13-23 UART_BAUD Update Sequence in AR mode if SLVDUEN is 0

Deviation Error on the Sync Field

When operating in Automatic Resynchronization mode, the controller will check the deviation error on the sync field. The deviation error is checked by comparing the current baud rate with the received sync field. Two checks are performed in parallel.

Check1: Based on measurement between the first falling edge and the last falling edge of the sync field.

- If the difference is more than 14.84%, the header error flag SLVHEF (UART_LINSTS[1]) will be set.
- If the difference is less than 14.06%, the header error flag SLVHEF (UART_LINSTS[1]) will

not be set.

- If the difference is between 14.84% and 14.06%, the header error flag SLVHEF (UART_LINSTS[1]) may either set or not.

Check2: Based on measurement of time between each falling edge of the sync field.

- If the difference is more than 18.75%, the header error flag SLVHEF (UART_LINSTS[1]) will be set.
- If the difference is less than 15.62%, the header error flag SLVHEF (UART_LINSTS[1]) will not be set.
- If the difference is between 18.75% and 15.62%, the header error flag SLVHEF (UART_LINSTS[1]) may either set or not.

Note: The deviation check is based on the current baud rate clock. Therefore, in order to guarantee correct deviation checking, the baud rate must reload the nominal value before each new break reception by setting SLVDUEN (UART_LINCTL[3]) register (It is recommend setting the SLVDUEN (UART_LINCTL[3]) bit before every checksum reception).

LIN Header Error Detection

In LIN Slave function mode, when user enables the header detection function by setting the SLVHDEN (UART_LINCTL[1]), hardware will handle the header detect flow. If the header has an error, the LIN header error flag SLVHEF (UART_LINSTS[1]) will be set and an interrupt is generated if the LINIEN (UART_INTEN[8]) bit is set. When header error is detected, user must reset the detect circuit to re-search a new frame header by writing 1 to SLVSYNCF (UART_LINSTS[3]) to re-search a new frame header.

The LIN header error flag SLVHEF (UART_LINSTS[1]) is set if one of the following conditions occurs:

- Break Delimiter is too short (less than 0.5-bit time).
- Frame error in sync field or Identifier field.
- The sync field data is not 0x55 (Non-Automatic Resynchronization mode).
- The sync field deviation error (With Automatic Resynchronization mode).
- The sync field measure time-out (With Automatic Resynchronization mode).
- LIN header reception time-out.

6.13.5.11 RS-485 Function Mode

Another alternate function of UART controller is RS-485 function (user must set UART_FUNCSEL [1:0] to '11' to enable RS-485 function), and direction control provided by nRTS pin from an asynchronous serial port. The RS-485 transceiver control is implemented by using the nRTS control signal to enable the RS-485 driver. Many characteristics of the RX and TX are same as UART in RS-485 mode.

The UART controller can be configured as a RS-485 addressable slave or a RS-485 master. RS-485 master transmitter will identify an address character by setting the parity (9th bit) to 1. For data characters, the parity is set to 0. Software can use UART_LINE register to control the 9th bit (When the PBE, EPE and SPE are set, the 9th bit is transmitted 0 and when PBE and SPE are set and EPE is cleared, the 9th bit is transmitted 1).

The controller supports three operation modes: RS-485 Normal Multidrop Operation Mode (NMM), RS-485 Auto Address Detection Operation Mode (AAD) and RS-485 Auto Direction Control Operation Mode (AUD). Software can choose any operation mode by programming the UART_ALTCTL register, and drive the transfer delay time between the last STOP bit leaving the TX FIFO and the de-assertion of by setting DLY (UART_TOUT [15:8]) register.

RS-485 Normal Multidrop Operation Mode (NMM)

In RS-485 Normal Multidrop Operation Mode (RS485NMM (UART_ALTCTL[8]) = 1), in first, software

must decide the data which before the address byte be detected will be stored in RX FIFO or not. If software wants to ignore any data before address byte detected, the flow is set RXOFF (UART_FIFO [8]) then enable RS485NMM (UART_ALTCTL [8]) and the receiver will ignore any data until an address byte is detected (bit 9 = 1) and the address byte data will be stored in the RX FIFO. If software wants to receive any data before address byte detected, the flow is disables RXOFF (UART_FIFO [8]) then enable RS485NMM (UART_ALTCTL [8]) and the receiver will received any data.

If an address byte is detected (bit 9 = 1), it will generate an interrupt to CPU and RXOFF (UART_FIFO [8]) can decide whether accepting the following data bytes are stored in the RX FIFO. If software disables receiver by setting RXOFF (UART_FIFO [8]) register, when a next address byte is detected, the controller will clear the RXOFF (UART_FIFO [8]) bit and the address byte data will be stored in the RX FIFO.

RS-485 Auto Address Detection Operation Mode (AAD)

In RS-485 Auto Address Detection Operation Mode (RS485AAD (UART_ALTCTL[9]) = 1), the receiver will ignore any data until an address byte is detected (bit 9 = 1) and the address byte data matches the ADDR MV (UART_ALTCTL[31:24]) value. The address byte data will be stored in the RX FIFO. The all received byte data will be accepted and stored in the RX FIFO until an address byte data not match the ADDR MV (UART_ALTCTL[31:24]) value.

RS-485 Auto Direction Function (AUD)

Another option function of RS-485 controllers is RS-485 auto direction control function (RS485AUD (UART_ALTCTL[10]) = 1). The RS-485 transceiver control is implemented by using the nRTS control signal from an asynchronous serial port. The nRTS line is connected to the RS-485 transceiver enable pin such that setting the nRTS line to high (logic 1) enables the RS-485 transceiver. Setting the nRTS line to low (logic 0) puts the transceiver into the tri-state condition to disabled. User can set RTSACTLV in UART_MODEM register to change the nRTS driving level.

Figure 6.13-24 demonstrates the RS-485 nRTS driving level in AUD mode. The nRTS pin will be automatically driven during TX data transmission.

Setting RTSACTLV(UART_MODEM[9]) can control nRTS pin output driving level. User can read the RTSSTS(UART_MODEM[13]) bit to get real nRTS pin output voltage logic status.

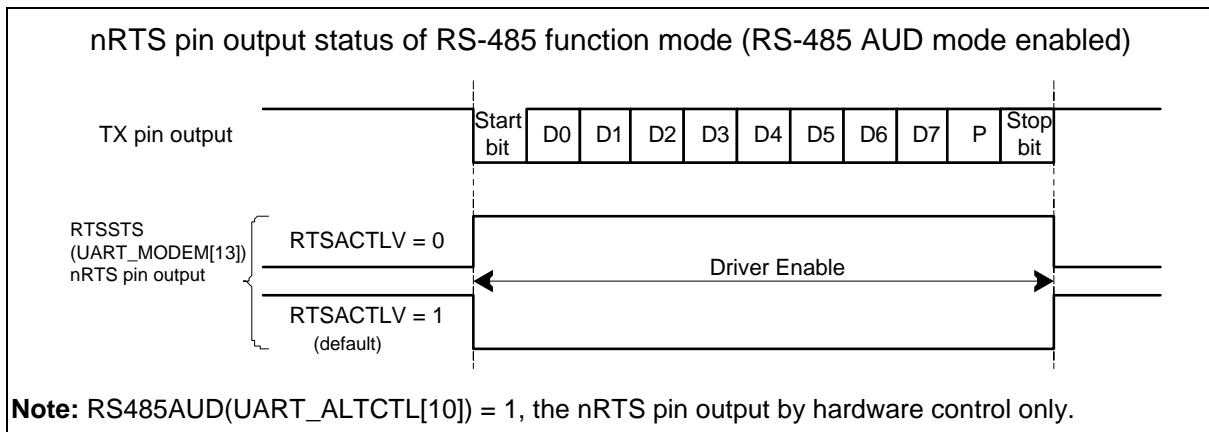

Figure 6.13-24 RS-485 nRTS Driving Level in Auto Direction Mode

Figure 6.13-25 demonstrates the RS-485 nRTS driving level in software control (RS485AUD (UART_ALTCTL[10])=0). The nRTS driving level is controlled by programming the RTS(UART_MODEM[1]) control bit.

Setting RTSACTLV (UART_MODEM[9]) can control the nRTS pin output is inverse or non-inverse from RTS(UART_MODEM[1]) control bit. User can read the RTSSTS (UART_MODEM[13]) bit to get real nRTS pin output voltage logic status. The structure of RS-485 frame is shown in Figure 6.13-26.

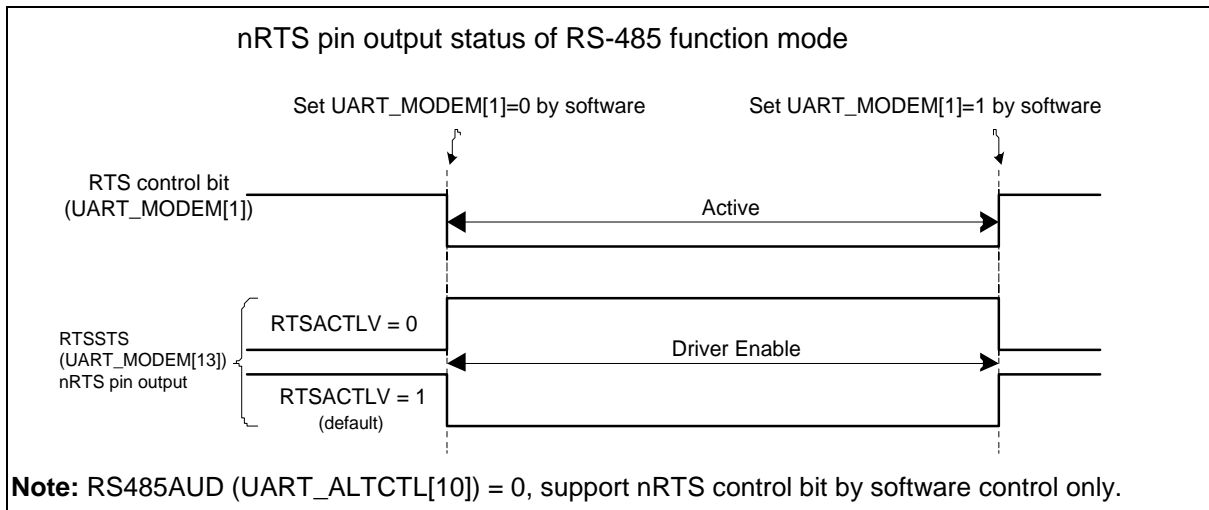

Figure 6.13-25 RS-485 nRTS Driving Level with Software Control

Programming Sequence Example:

1. Program FUNCSEL in UART_FUNCSEL to select RS-485 function.
2. Program the RXOFF (UART_FIFO[8]) to determine enable or disable the receiver RS-485 receiver.
3. Program the RS485NMM (UART_ALTCTL[8]) or RS485AAD (UART_ALTCTL[9]) mode.
4. If the RS485AAD (UART_ALTCTL[9]) mode is selected, the ADDR MV (UART_ALTCTL[31:24]) is programmed for auto address match value.
5. Determine auto direction control by programming RS485AUD (UART_ALTCTL[10]).

Figure 6.13-26 Structure of RS-485 Frame

6.13.5.12 UART Single-wire Half Duplex

The UART controller provides single-wire half duplex function in UART function mode. Setting UART_FUNCSEL [2:0] to '3'b100' to enable the UART Single-wire function. The single-wire bus is idle (RXIDLE(UART_FIFOSTS[29]) = 1) in RX state. Before writing data to transmit buffer (UART_DAT[7:0]), the bus state should be checked in idle (RXIDLE(UART_FIFOSTS[29])). By writing data to transmit buffer, the bus state transfers to TX state immediately. After the transmission, the bus state transfers from TX state to RX state.

The UART will not allowed to receive data in single-wire half duplex function TX mode. If nRTS is asserted in TX mode, nRTS will make the docking UART device send out data and cause bus confliction. To reduce the bus confliction, the UART controller supports flow control function and bit error detection but do not support auto-flow control function. The nRTS is automatically inactivated in single-wire TX state. In TX state, the UART controller will monitor bus state. If the bus state is not equal to TX state, the SWBEIF(UART_INTSTS[16]) is set.

6.13.5.13 PDMA Transfer Function

The UART controller supports PDMA transfer function.

By configuring PDMA parameter and set UART_DAT as the PDMA destination address. When TXPDMAEN (UART_INTEN[14]) is set to 1, the controller will issue request to PDMA controller to start the PDMA transmission process automatically.

By configuring PDMA parameter and set UART_DAT as the PDMA source address. When RXPDMAEN (UART_INTEN[15]) is set to 1, the controller will start the PDMA reception process. UART controller will issue request to PDMA controller automatically when there is data in the RX FIFO buffer.

Note: If STOPn (PDMA_STOP[n]) is set to stop UART RXPDMA task and the UART receive is not finish. UART controller will complete the transfer and stored current receive data in receive buffer. By reading RXEMPTY (UART_FIFOSTS[14]) to check there is valid data in receive buffer or not.

6.13.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
UART Base Address: $UARTx_BA = 0x4007_0000 + (0x1000 * x)$ $x=0,1,2$

Reserved	WKIEN	BUFERRIEN	RXTOIEN	MODEMIEN	RLSIEN	THREIEN	RDAIEN

Bits	Description
[31:23]	Reserved Reserved.
[22]	TXENDIEN Transmitter Empty Interrupt Enable Bit If TXENDIEN (UART_INTEN[22]) is enabled, the Transmitter Empty interrupt TXENDINT (UART_INTSTS[30]) will be generated when TXENDIF (UART_INTSTS[22]) is set (TX FIFO (UART_DAT) is empty and the STOP bit of the last byte has been transmitted). 0 = Transmitter empty interrupt Disabled. 1 = Transmitter empty interrupt Enabled.
[21:19]	Reserved Reserved.
[18]	ABRIEN Auto-baud Rate Interrupt Enable Bit 0 = Auto-baud rate interrupt Disabled. 1 = Auto-baud rate interrupt Enabled.
[17]	Reserved Reserved.
[16]	SWBEIEN Single-wire Bit Error Detection Interrupt Enable Bit Set this bit, the Single-wire Half Duplex Bit Error Detection Interrupt SWBEINT(UART_INTSTS[24]) is generated when Single-wire Bit Error Detection SWBEIF(UART_INTSTS[16]) is set. 0 = Single-wire Bit Error Detect Inerrupt Disabled. 1 = Single-wire Bit Error Detect Inerrupt Enabled. Note: This bit is valid when FUNCSEL (UART_FUNCSEL[2:0]) is select UART Single-wire mode.
[15]	RXPDMAEN RX PDMA Enable Bit This bit can enable or disable RX PDMA service. 0 = RX PDMA Disabled. 1 = RX PDMA Enabled. Note: If RLSIEN (UART_INTEN[2]) is enabled and HWRLSINT (UART_INTSTS[26]) is set to 1, the RLS (Receive Line Status) Interrupt is caused. If RLS interrupt is caused by Break Error Flag BIF(UART_FIFOSTS[6]), Frame Error Flag FEF(UART_FIFO[5]) or Parity Error Flag PEF(UART_FIFOSTS[4]), UART PDMA receive request operation is stopped. Clear Break Error Flag BIF or Frame Error Flag FEF or Parity Error Flag PEF by

		writing "1" to corresponding BIF, FEF and PEF to make UART PDMA receive request operation continue.
[14]	TXPDMAEN	<p>TX PDMA Enable Bit 0 = TX PDMA Disabled. 1 = TX PDMA Enabled.</p> <p>Note: If RLSIEN (UART_INTEN[2]) is enabled and HWRLSINT (UART_INTSTS[26]) is set to 1, the RLS (Receive Line Status) Interrupt is caused. If RLS interrupt is caused by Break Error Flag BIF(UART_FIFOSTS[6]), Frame Error Flag FEF(UART_FIFO[5]) or Parity Error Flag PEF(UART_FIFOSTS[4]), UART PDMA transmit request operation is stopped. Clear Break Error Flag BIF or Frame Error Flag FEF or Parity Error Flag PEF by writing "1" to corresponding BIF, FEF and PEF to make UART PDMA transmit request operation continue.</p>
[13]	ATOCTSEN	<p>nCTS Auto-flow Control Enable Bit 0 = nCTS auto-flow control Disabled. 1 = nCTS auto-flow control Enabled.</p> <p>Note: When nCTS auto-flow is enabled, the UART will send data to external device if nCTS input assert (UART will not send data to device until nCTS is asserted).</p>
[12]	ATORTSEN	<p>nRTS Auto-flow Control Enable Bit 0 = nRTS auto-flow control Disabled. 1 = nRTS auto-flow control Enabled.</p> <p>Note: When nRTS auto-flow is enabled, if the number of bytes in the RX FIFO equals the RTSTRGLV (UART_FIFO[19:16]), the UART will de-assert nRTS signal.</p>
[11]	TOCNTEN	<p>Receive Buffer Time-out Counter Enable Bit 0 = Receive Buffer Time-out counter Disabled. 1 = Receive Buffer Time-out counter Enabled.</p>
[10:9]	Reserved	Reserved.
[8]	LINIEN	<p>LIN Bus Interrupt Enable Bit 0 = LIN bus interrupt Disabled. 1 = LIN bus interrupt Enabled.</p> <p>Note: This bit is used for LIN function mode.</p>
[7]	Reserved	Reserved.
[6]	WKIEN	<p>Wake-up Interrupt Enable Bit 0 = Wake-up Interrupt Disabled. 1 = Wake-up Interrupt Enabled.</p>
[5]	BUFERRIEN	<p>Buffer Error Interrupt Enable Bit 0 = Buffer error interrupt Disabled. 1 = Buffer error interrupt Enabled.</p>
[4]	RXTOIEN	<p>RX Time-out Interrupt Enable Bit 0 = RX time-out interrupt Disabled. 1 = RX time-out interrupt Enabled.</p>
[3]	MODEMIEN	<p>Modem Status Interrupt Enable Bit 0 = Modem status interrupt Disabled. 1 = Modem status interrupt Enabled.</p>
[2]	RLSIEN	<p>Receive Line Status Interrupt Enable Bit 0 = Receive Line Status interrupt Disabled. 1 = Receive Line Status interrupt Enabled.</p>
[1]	THREIEN	<p>Transmit Holding Register Empty Interrupt Enable Bit</p>

		0 = Transmit holding register empty interrupt Disabled. 1 = Transmit holding register empty interrupt Enabled.
[0]	RDAIEN	Receive Data Available Interrupt Enable Bit 0 = Receive data available interrupt Disabled. 1 = Receive data available interrupt Enabled.

UART FIFO Control Register (UART_FIFO)

Bits	Description
[31]	<p>TXRXACT</p> <p>TX and RX Active Status (Read Only) This bit indicates TX and RX are active or inactive. 0 = TX and RX are inactive. 1 = TX and RX are active. (Default)</p> <p>Note: When TXRXDIS (UART_FUNCSEL[3]) is set and both TX and RX are in idle state, this bit is cleared. The UART controller can not transmit or receive data at this moment. Otherwise this bit is set.</p>
[30]	<p>Reserved</p> <p>Reserved.</p>
[29]	<p>RXIDLE</p> <p>RX Idle Status (Read Only) This bit is set by hardware when RX is idle. 0 = RX is busy. 1 = RX is idle. (Default)</p>
[28]	<p>TXEMPTYF</p> <p>Transmitter Empty Flag (Read Only) This bit is set by hardware when TX FIFO (UART_DAT) is empty and the STOP bit of the last byte has been transmitted. 0 = TX FIFO is not empty or the STOP bit of the last byte has been not transmitted. 1 = TX FIFO is empty and the STOP bit of the last byte has been transmitted.</p> <p>Note: This bit is cleared automatically when TX FIFO is not empty or the last byte transmission has not completed.</p>
[27:25]	<p>Reserved</p> <p>Reserved.</p>
[24]	<p>TXOVIF</p> <p>TX Overflow Error Interrupt Flag If TX FIFO (UART_DAT) is full, an additional write to UART_DAT will cause this bit to logic 1. 0 = TX FIFO is not overflow. 1 = TX FIFO is overflow.</p> <p>Note: This bit can be cleared by writing "1" to it.</p>
[23]	<p>TXFULL</p> <p>Transmitter FIFO Full (Read Only)</p>

		<p>This bit indicates TX FIFO full or not.</p> <p>0 = TX FIFO is not full.</p> <p>1 = TX FIFO is full.</p> <p>Note: This bit is set when the number of usage in TX FIFO Buffer is equal to 16, otherwise it is cleared by hardware.</p>
[22]	TXEMPTY	<p>Transmitter FIFO Empty (Read Only)</p> <p>This bit indicates TX FIFO empty or not.</p> <p>0 = TX FIFO is not empty.</p> <p>1 = TX FIFO is empty.</p> <p>Note: When the last byte of TX FIFO has been transferred to Transmitter Shift Register, hardware sets this bit high. It will be cleared when writing data into UART_DAT (TX FIFO not empty).</p>
[21:16]	TXPTR	<p>TX FIFO Pointer (Read Only)</p> <p>This field indicates the TX FIFO Buffer Pointer. When CPU writes one byte into UART_DAT, TXPTR increases one. When one byte of TX FIFO is transferred to Transmitter Shift Register, TXPTR decreases one.</p> <p>The Maximum value shown in TXPTR is 15. When the using level of TX FIFO Buffer equal to 16, the TXFULL bit is set to 1 and TXPTR will show 0. As one byte of TX FIFO is transferred to Transmitter Shift Register, the TXFULL bit is cleared to 0 and TXPTR will show 15.</p>
[15]	RXFULL	<p>Receiver FIFO Full (Read Only)</p> <p>This bit initiates RX FIFO full or not.</p> <p>0 = RX FIFO is not full.</p> <p>1 = RX FIFO is full.</p> <p>Note: This bit is set when the number of usage in RX FIFO Buffer is equal to 16, otherwise it is cleared by hardware.</p>
[14]	RXEMPTY	<p>Receiver FIFO Empty (Read Only)</p> <p>This bit initiate RX FIFO empty or not.</p> <p>0 = RX FIFO is not empty.</p> <p>1 = RX FIFO is empty.</p> <p>Note: When the last byte of RX FIFO has been read by CPU, hardware sets this bit high. It will be cleared when UART receives any new data.</p>
[13:8]	RXPTR	<p>RX FIFO Pointer (Read Only)</p> <p>This field indicates the RX FIFO Buffer Pointer. When UART receives one byte from external device, RXPTR increases one. When one byte of RX FIFO is read by CPU, RXPTR decreases one.</p> <p>The Maximum value shown in RXPTR is 15. When the using level of RX FIFO Buffer equal to 16, the RXFULL bit is set to 1 and RXPTR will show 0. As one byte of RX FIFO is read by CPU, the RXFULL bit is cleared to 0 and RXPTR will show 15.</p>
[7]	Reserved	Reserved.
[6]	BIF	<p>Break Interrupt Flag</p> <p>This bit is set to logic 1 whenever the received data input (RX) is held in the "spacing state" (logic 0) for longer than a full word transmission time (that is, the total time of "START bit" + data bits + parity + STOP bits).</p> <p>0 = No Break interrupt is generated.</p> <p>1 = Break interrupt is generated.</p> <p>Note: This bit can be cleared by writing "1" to it.</p>
[5]	FEF	<p>Framing Error Flag</p> <p>This bit is set to logic 1 whenever the received character does not have a valid "STOP bit" (that is, the STOP bit following the last data bit or PARITY bit is detected as logic 0).</p> <p>0 = No framing error is generated.</p>

		<p>1 = Framing error is generated. Note: This bit can be cleared by writing "1" to it.</p>
[4]	PEF	<p>Parity Error Flag This bit is set to logic 1 whenever the received character does not have a valid "PARITY bit". 0 = No parity error is generated. 1 = Parity error is generated. Note: This bit can be cleared by writing "1" to it.</p>
[3]	ADDRDET	<p>RS-485 Address Byte Detect Flag 0 = Receiver detects a data that is not an address bit (bit 9 = '0'). 1 = Receiver detects a data that is an address bit (bit 9 = '1'). Note 1: This field is used for RS-485 function mode and ADDRDEN (UART_ALTCTL[15]) is set to 1 to enable Address detection mode. Note 2: This bit can be cleared by writing "1" to it.</p>
[2]	ABRDTOIF	<p>Auto-baud Rate Detect Time-out Interrupt Flag This bit is set to logic "1" in Auto-baud Rate Detect mode when the baud rate counter is overflow. 0 = Auto-baud rate counter is underflow. 1 = Auto-baud rate counter is overflow. Note: This bit can be cleared by writing "1" to it.</p>
[1]	ABRDIF	<p>Auto-baud Rate Detect Interrupt Flag This bit is set to logic "1" when auto-baud rate detect function is finished. 0 = Auto-baud rate detect function is not finished. 1 = Auto-baud rate detect function is finished. Note: This bit can be cleared by writing "1" to it.</p>
[0]	RXOVIF	<p>RX Overflow Error Interrupt Flag This bit is set when RX FIFO overflow. If the number of bytes of received data is greater than RX_FIFO (UART_DAT) size 16 bytes, this bit will be set. 0 = RX FIFO is not overflow. 1 = RX FIFO is overflow. Note: This bit can be cleared by writing "1" to it.</p>

UART Interrupt Status Register (UART_INTSTS)

Bits	Description	
[31]	ABRINT	<p>Auto-baud Rate Interrupt Indicator (Read Only)</p> <p>This bit is set if ABRIEN (UART_INTEN[18]) and ABRIF (UART_ALTCTL[17]) are both set to 1.</p> <p>0 = No Auto-baud Rate interrupt is generated.</p> <p>1 = The Auto-baud Rate interrupt is generated.</p>
[30]	TXENDINT	<p>Transmitter Empty Interrupt Indicator (Read Only)</p> <p>This bit is set if TXENDIEN (UART_INTEN[22]) and TXENDIF(UART_INTSTS[22]) are both set to 1.</p> <p>0 = No Transmitter Empty interrupt is generated.</p> <p>1 = Transmitter Empty interrupt is generated.</p>
[29]	HWBUFEINT	<p>PDMA Mode Buffer Error Interrupt Indicator (Read Only)</p> <p>This bit is set if BUFERRIEN (UART_INTEN[5]) and HWBUFEIF (UART_INTSTS[21]) are both set to 1.</p> <p>0 = No buffer error interrupt is generated in PDMA mode.</p> <p>1 = Buffer error interrupt is generated in PDMA mode.</p>
[28]	HWTOINT	<p>PDMA Mode RX Time-out Interrupt Indicator (Read Only)</p> <p>This bit is set if RXTOIEN (UART_INTEN[4]) and HWTOIF(UART_INTSTS[20]) are both set to 1.</p> <p>0 = No RX time-out interrupt is generated in PDMA mode.</p> <p>1 = RX time-out interrupt is generated in PDMA mode.</p>
[27]	HWMODINT	<p>PDMA Mode MODEM Status Interrupt Indicator (Read Only)</p> <p>This bit is set if MODEMIEN (UART_INTEN[3]) and HWMODIF(UART_INTSTS[19]) are both set to 1.</p> <p>0 = No Modem interrupt is generated in PDMA mode.</p> <p>1 = Modem interrupt is generated in PDMA mode.</p>
[26]	HWRLSINT	<p>PDMA Mode Receive Line Status Interrupt Indicator (Read Only)</p> <p>This bit is set if RLSIEN (UART_INTEN[2]) and HWRLSIF(UART_INTSTS[18]) are both set to 1.</p>

		0 = No RLS interrupt is generated in PDMA mode. 1 = RLS interrupt is generated in PDMA mode.
[25]	Reserved	Reserved.
[24]	SWBEINT	Single-wire Bit Error Detect Interrupt Indicator (Read Only) This bit is set if SWBEIEN (UART_INTEN[16]) and SWBEIF (UART_INTSTS[16]) are both set to 1. 0 = No Single-wire Bit Error Detection Interrupt generated. 1 = Single-wire Bit Error Detection Interrupt generated.
[23]	Reserved	Reserved.
[22]	TXENDIF	Transmitter Empty Interrupt Flag This bit is set when TX FIFO (UART_DAT) is empty and the STOP bit of the last byte has been transmitted (TXEMPTYF (UART_FIFOSTS[28]) is set). If TXENDIEN (UART_INTEN[22]) is enabled, the Transmitter Empty interrupt will be generated. 0 = No transmitter empty interrupt flag is generated. 1 = Transmitter empty interrupt flag is generated. Note: This bit is cleared automatically when TX FIFO is not empty or the last byte transmission has not completed.
[21]	HWBUFEIF	PDMA Mode Buffer Error Interrupt Flag (Read Only) This bit is set when the TX or RX FIFO overflows (TXOVIF (UART_FIFOSTS [24]) or RXOVIF (UART_FIFOSTS[0]) is set). When BUFERRIF (UART_INTSTS[5]) is set, the transfer maybe is not correct. If BUFERRIEN (UART_INTEN [5]) is enabled, the buffer error interrupt will be generated. 0 = No buffer error interrupt flag is generated in PDMA mode. 1 = Buffer error interrupt flag is generated in PDMA mode. Note: This bit is cleared when both TXOVIF (UART_FIFOSTS[24]) and RXOVIF (UART_FIFOSTS[0]) are cleared.
[20]	HWTOIF	PDMA Mode RX Time-out Interrupt Flag (Read Only) This bit is set when the RX FIFO is not empty and no activities occurred in the RX FIFO and the time-out counter equal to TOIC (UART_TOUT[7:0]). If RXTOIEN (UART_INTEN [4]) is enabled, the RX time-out interrupt will be generated . 0 = No RX time-out interrupt flag is generated in PDMA mode. 1 = RX time-out interrupt flag is generated in PDMA mode. Note: This bit is read only and user can read UART_DAT (RX is in active) to clear it.
[19]	HWMODIF	PDMA Mode MODEM Interrupt Flag (Read Only) This bit is set when the nCTS pin has state change (CTSDETF (UART_MODEMSTS [0] =1)). If MODEMIEN (UART_INTEN [3]) is enabled, the Modem interrupt will be generated. 0 = No Modem interrupt flag is generated in PDMA mode. 1 = Modem interrupt flag is generated in PDMA mode. Note: This bit is read only and reset to 0 when the bit CTSDETF (UART_MODEMSTS[0]) is cleared by writing 1 on CTSDETF (UART_MODEMSTS [0]).
[18]	HWRLSIF	PDMA Mode Receive Line Status Flag (Read Only) This bit is set when the RX receive data have parity error, frame error or break error (at least one of 3 bits, BIF (UART_FIFOSTS[6]), FEF (UART_FIFOSTS[5]) and PEF (UART_FIFOSTS[4]) is set). If RLSIEN (UART_INTEN [2]) is enabled, the RLS interrupt will be generated. 0 = No RLS interrupt flag is generated in PDMA mode. 1 = RLS interrupt flag is generated in PDMA mode. Note 1: In RS-485 function mode, this field includes "receiver detect any address byte received address byte character (bit9 = '1') bit". Note 2: In UART function mode, this bit is read only and reset to 0 when all bits of BIF(UART_FIFOSTS[6]), FEF(UART_FIFOSTS[5]) and PEF(UART_FIFOSTS[4]) are

		cleared. Note 3: In RS-485 function mode, this bit is read only and reset to 0 when all bits of BIF(UART_FIFOSTS[6]), FEF(UART_FIFOSTS[5]), PEF(UART_FIFOSTS[4]) and ADDRDEF (UART_FIFOSTS[3]) are cleared.
[17]	Reserved	Reserved.
[16]	SWBEIF	Single-wire Bit Error Detection Interrupt Flag This bit is set when the single wire bus state not equals to UART controller TX state in Single-wire mode. 0 = No single-wire bit error detection interrupt flag is generated. 1 = Single-wire bit error detection interrupt flag is generated. Note 1: This bit is active when FUNCSEL (UART_FUNCSEL[2:0]) is select UART Single-wire mode. Note 2: This bit can be cleared by writing "1" to it.
[15]	LININT	LIN Bus Interrupt Indicator (Read Only) This bit is set if LINIEN (UART_INTEN[8]) and LINIF(UART_INTSTS[7]) are both set to 1. 0 = No LIN Bus interrupt is generated. 1 = The LIN Bus interrupt is generated.
[14]	WKINT	UART Wake-up Interrupt Indicator (Read Only) This bit is set if WKIEN (UART_INTEN[6]) and WKIF (UART_INTSTS[6]) are both set to 1. 0 = No UART wake-up interrupt is generated. 1 = UART wake-up interrupt is generated.
[13]	BUFERRINT	Buffer Error Interrupt Indicator (Read Only) This bit is set if BUFERRIEN(UART_INTEN[5]) and BUFERRIF(UART_INTSTS[5]) are both set to 1. 0 = No buffer error interrupt is generated. 1 = Buffer error interrupt is generated.
[12]	RXTOINT	RX Time-out Interrupt Indicator (Read Only) This bit is set if RXTOIEN (UART_INTEN[4]) and RXTOIF(UART_INTSTS[4]) are both set to 1. 0 = No RX time-out interrupt is generated. 1 = RX time-out interrupt is generated.
[11]	MODEMINT	MODEM Status Interrupt Indicator (Read Only) This bit is set if MODEMIEN(UART_INTEN[3]) and MODEMIF(UART_INTSTS[3]) are both set to 1 0 = No Modem interrupt is generated. 1 = Modem interrupt is generated..
[10]	RLSINT	Receive Line Status Interrupt Indicator (Read Only) This bit is set if RLSIEN (UART_INTEN[2]) and RLSIF(UART_INTSTS[2]) are both set to 1. 0 = No RLS interrupt is generated. 1 = RLS interrupt is generated.
[9]	THREINT	Transmit Holding Register Empty Interrupt Indicator (Read Only) This bit is set if THREIEN (UART_INTEN[1]) and THREIF(UART_INTSTS[1]) are both set to 1. 0 = No THRE interrupt is generated. 1 = THRE interrupt is generated.

[8]	RDAINT	<p>Receive Data Available Interrupt Indicator (Read Only)</p> <p>This bit is set if RDAIEN (UART_INTEN[0]) and RDAIF (UART_INTSTS[0]) are both set to 1.</p> <p>0 = No RDA interrupt is generated.</p> <p>1 = RDA interrupt is generated.</p>
[7]	LINIF	<p>LIN Bus Interrupt Flag</p> <p>This bit is set when LIN slave header detect (SLVHDET (UART_LINSTS[0]=1)), LIN break detect (BRKDET (UART_LINSTS[8]=1)), bit error detect (BITEF (UART_LINSTS[9]=1)), LIN slave ID parity error (SLVIDPEF (UART_LINSTS[2]=1)) or LIN slave header error detect (SLVHEF (UART_LINSTS[1])). If LINIEN (UART_INTEN [8]) is enabled the LIN interrupt will be generated.</p> <p>0 = None of SLVHDET, BRKDET, BITEF, SLVIDPEF and SLVHEF is generated.</p> <p>1 = At least one of SLVHDET, BRKDET, BITEF, SLVIDPEF and SLVHEF is generated.</p> <p>Note: This bit is cleared when SLVHDET (UART_LINSTS[0]), BRKDET (UART_LINSTS[8]), BITEF (UART_LINSTS[9]), SLVIDPEF (UART_LINSTS[2]) and SLVHEF (UART_LINSTS[1]) all are cleared and software writing '1' to LINIF (UART_INTSTS[7]).</p>
[6]	WKIF	<p>UART Wake-up Interrupt Flag (Read Only)</p> <p>This bit is set when TOUTWKF (UART_WKSTS[4]), RS485WKF (UART_WKSTS[3]), RFRTWKF (UART_WKSTS[2]), DATWKF (UART_WKSTS[1]) or CTSWKF (UART_WKSTS[0]) is set to 1.</p> <p>0 = No UART wake-up interrupt flag is generated.</p> <p>1 = UART wake-up interrupt flag is generated.</p> <p>Note: This bit is cleared if all of TOUTWKF, RS485WKF, RFRTWKF, DATWKF and CTSWKF are cleared to 0 by writing 1 to the corresponding interrupt flag.</p>
[5]	BUFERRIF	<p>Buffer Error Interrupt Flag (Read Only)</p> <p>This bit is set when the TX FIFO or RX FIFO overflows (TXOVIF (UART_FIFOSTS[24]) or RXOVIF (UART_FIFOSTS[0]) is set). When BUFERRIF (UART_INTSTS[5]) is set, the transfer is not correct. If BUFERRIF (UART_INTEN [5]) is enabled, the buffer error interrupt will be generated.</p> <p>0 = No buffer error interrupt flag is generated.</p> <p>1 = Buffer error interrupt flag is generated.</p> <p>Note: This bit is cleared if both of RXOVIF (UART_FIFOSTS[0]) and TXOVIF (UART_FIFOSTS[24]) are cleared to 0 by writing 1 to RXOVIF (UART_FIFOSTS[0]) and TXOVIF (UART_FIFOSTS[24]).</p>
[4]	RXTOIF	<p>RX Time-out Interrupt Flag (Read Only)</p> <p>This bit is set when the RX FIFO is not empty and no activities occurred in the RX FIFO and the time-out counter equal to TOIC (UART_TOUT[7:0]). If RXTOIEN (UART_INTEN [4]) is enabled, the RX time-out interrupt will be generated.</p> <p>0 = No RX time-out interrupt flag is generated.</p> <p>1 = RX time-out interrupt flag is generated.</p> <p>Note: This bit is read only and user can read UART_DAT (RX is in active) to clear it.</p>
[3]	MODEMIF	<p>MODEM Interrupt Flag (Read Only)</p> <p>This bit is set when the nCTS pin has state change (CTSDET (UART_MODEMSTS[0]) = 1). If MODEMIEN (UART_INTEN [3]) is enabled, the Modem interrupt will be generated.</p> <p>0 = No Modem interrupt flag is generated.</p> <p>1 = Modem interrupt flag is generated.</p> <p>Note: This bit is read only and reset to 0 when bit CTSDET is cleared by a write 1 on CTSDET (UART_MODEMSTS[0]).</p>
[2]	RLSIF	<p>Receive Line Interrupt Flag (Read Only)</p> <p>This bit is set when the RX receive data have parity error, frame error or break error (at least one of 3 bits, BIF (UART_FIFOSTS[6]), FEF (UART_FIFOSTS[5]) and</p>

		<p>PEF(UART_FIFOSTS[4]), is set). If RLSIEN (UART_INTEN [2]) is enabled, the RLS interrupt will be generated.</p> <p>0 = No RLS interrupt flag is generated. 1 = RLS interrupt flag is generated.</p> <p>Note 1: In RS-485 function mode, this field is set include "receiver detect and received address byte character (bit9 = '1' bit)". At the same time, the bit of ADDRDEF (UART_FIFOSTS[3]) is also set.</p> <p>Note 2: This bit is read only and reset to 0 when all bits of BIF (UART_FIFOSTS[6]), FEF(UART_FIFOSTS[5]) and PEF(UART_FIFOSTS[4]) are cleared.</p> <p>Note 3: In RS-485 function mode, this bit is read only and reset to 0 when all bits of BIF (UART_FIFOSTS[6]), FEF(UART_FIFOSTS[5]), PEF(UART_FIFOSTS[4]) and ADDRDEF (UART_FIFOSTS[3]) are cleared.</p>
[1]	THREIF	<p>Transmit Holding Register Empty Interrupt Flag</p> <p>This bit is set when the last data of TX FIFO is transferred to Transmitter Shift Register. If THREIEN (UART_INTEN[1]) is enabled, the THRE interrupt will be generated.</p> <p>0 = No THRE interrupt flag is generated. 1 = THRE interrupt flag is generated.</p> <p>Note: This bit is read only and it will be cleared when writing data into UART_DAT (TX FIFO not empty).</p>
[0]	RDAIF	<p>Receive Data Available Interrupt Flag</p> <p>When the number of bytes in the RX FIFO equals the RFITL then the RDAIF(UART_INTSTS[0]) will be set. If RDAIEN (UART_INTEN [0]) is enabled, the RDA interrupt will be generated.</p> <p>0 = No RDA interrupt flag is generated. 1 = RDA interrupt flag is generated.</p> <p>Note: This bit is read only and it will be cleared when the number of unread bytes of RX FIFO drops below the threshold level (RFITL(UART_FIFO[7:4])).</p>

UART Time-out Register (UART_TOUT)

Register	Offset	R/W	Description	Reset Value
UART_TOUT x=0,1,2	UARTx_BA+0x20	R/W	UART Time-out Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
DLY							
7	6	5	4	3	2	1	0
TOIC							

Bits	Description	
[31:16]	Reserved	Reserved.
[15:8]	DLY	TX Delay Time Value This field is used to program the transfer delay time between the last STOP bit and next START bit. The unit is bit time.
[7:0]	TOIC	Time-out Interrupt Comparator The time-out counter resets and starts counting (the counting clock = baud rate) whenever the RX FIFO receives a new data word if time out counter is enabled by setting TOCNTEN (UART_INTEN[11]). Once the content of time-out counter is equal to that of time-out interrupt comparator (TOIC (UART_TOUT[7:0])), a receiver time-out interrupt (RXTOINT(UART_INTSTS[12])) is generated if RXTOIEN (UART_INTEN [4]) enabled. A new incoming data word or RX FIFO empty will clear RXTOIF (UART_INTSTS[4]). In order to avoid receiver time-out interrupt generation immediately during one character is being received, TOIC value should be set between 40 and 255. So, for example, if TOIC is set with 40, the time-out interrupt is generated after four characters are not received when 1 STOP bit and no parity check is set for UART transfer.

UART Baud Rate Divider Register (UART_BAUD)

Register	Offset	R/W	Description	Reset Value
UART_BAUD x=0,1,2	UARTx_BA+0x24	R/W	UART Baud Rate Divider Register	0x0F00_0000

15	14	13	12	11	10	9	8
Reserved			BITERREN	LINRXOFF	BRKDETEN	IDPEN	SENDH
7	6	5	4	3	2	1	0
Reserved			MUTE	SLVDUEN	SLVAREN	SLVHDEN	SLVEN

Bits	Description
[31:24]	<p>PID</p> <p>LIN PID Bits This field contains the LIN frame ID value in LIN function mode, and the frame ID parity can be generated by software or hardware depends on IDPEN (UART_LINCTL[9]) = 1. If the parity generated by hardware, user fill ID0-ID5 (PID [29:24]), hardware will calculate P0 (PID[30]) and P1 (PID[31]), otherwise user must filled frame ID and parity in this field. Note 1: User can fill any 8-bit value to this field and the bit 24 indicates ID0 (LSB first). Note 2: This field can be used for LIN master mode or slave mode.</p>
[23:22]	<p>HSEL</p> <p>LIN Header Select 00 = The LIN header includes "break field". 01 = The LIN header includes "break field" and "sync field". 10 = The LIN header includes "break field", "sync field" and "frame ID field". 11 = Reserved. Note: This bit is used to master mode for LIN to send header field (SENDH (UART_LINCTL [8]) = 1) or used to slave to indicates exit from mute mode condition (MUTE (UART_LINCTL[4] = 1).</p>
[21:20]	<p>BSL</p> <p>LIN Break/Sync Delimiter Length 00 = The LIN break/sync delimiter length is 1-bit time. 01 = The LIN break/sync delimiter length is 2-bit time. 10 = The LIN break/sync delimiter length is 3-bit time. 11 = The LIN break/sync delimiter length is 4-bit time. Note: This bit used for LIN master to sending header field.</p>
[19:16]	<p>BRKFL</p> <p>LIN Break Field Length This field indicates a 4-bit LIN TX break field count. Note 1: These registers are shadow registers of BRKFL (UART_ALTCTL[3:0]), User can read/write it by setting BRKFL (UART_ALTCTL[3:0]) or BRKFL (UART_LINCTL[19:16]). Note 2: This break field length is BRKFL + 1. Note 3: According to LIN spec, the reset value is 12 (break field length = 13).</p>
[16:15]	<p>Reserved</p> <p>Reserved.</p>

[12]	BITERREN	<p>Bit Error Detect Enable Bit</p> <p>0 = Bit error detection function Disabled. 1 = Bit error detection function Enabled.</p> <p>Note: In LIN function mode, when occur bit error, the BITEF (UART_LINSTS[9]) flag will be asserted. If the LINIEN (UART_INTEN[8]) = 1, an interrupt will be generated.</p>
[11]	LINRXOFF	<p>LIN Receiver Disable Bit</p> <p>If the receiver is enabled (LINRXOFF (UART_LINCTL[11]) = 0), all received byte data will be accepted and stored in the RX FIFO, and if the receiver is disabled (LINRXOFF (UART_LINCTL[11]) = 1), all received byte data will be ignore.</p> <p>0 = LIN receiver Enabled. 1 = LIN receiver Disabled.</p> <p>Note: This bit is only valid when operating in LIN function mode (FUNCSEL (UART_FUNCSEL[1:0]) = 01).</p>
[10]	BRKDETEN	<p>LIN Break Detection Enable Bit</p> <p>When detect consecutive dominant greater than 11 bits, and are followed by a delimiter character, the BRKDETF (UART_LINSTS[8]) flag is set at the end of break field. If the LINIEN (UART_INTEN [8])=1, an interrupt will be generated.</p> <p>0 = LIN break detection Disabled . 1 = LIN break detection Enabled.</p>
[9]	IDPEN	<p>LIN ID Parity Enable Bit</p> <p>0 = LIN frame ID parity Disabled. 1 = LIN frame ID parity Enabled.</p> <p>Note 1: This bit can be used for LIN master to sending header field (SENDH (UART_LINCTL[8])) = 1 and HSEL (UART_LINCTL[23:22]) = 10 or be used for enable LIN slave received frame ID parity checked.</p> <p>Note 2: This bit is only used when the operation header transmitter is in HSEL (UART_LINCTL[23:22]) = 10.</p>
[8]	SENDH	<p>LIN TX Send Header Enable Bit</p> <p>The LIN TX header can be “break field” or “break and sync field” or “break, sync and frame ID field”, it is depend on setting HSEL (UART_LINCTL[23:22]).</p> <p>0 = Send LIN TX header Disabled. 1 = Send LIN TX header Enabled.</p> <p>Note 1: This bit is shadow bit of LINTXEN (UART_ALTCTL [7]); user can read/write it by setting LINTXEN (UART_ALTCTL [7]) or SENDH (UART_LINCTL [8]).</p> <p>Note 2: When transmitter header field (it may be “break” or “break + sync” or “break + sync + frame ID” selected by HSEL (UART_LINCTL[23:22]) field) transfer operation finished, this bit will be cleared automatically.</p>
[7:5]	Reserved	Reserved.
[4]	MUTE	<p>LIN Mute Mode Enable Bit</p> <p>0 = LIN mute mode Disabled. 1 = LIN mute mode Enabled.</p> <p>Note: The exit from mute mode condition and each control and interactions of this field are explained in 6.13.5.10 (LIN slave mode).</p>
[3]	SLVDUEN	<p>LIN Slave Divider Update Method Enable Bit</p> <p>0 = UART_BAUD updated is written by software (if no automatic resynchronization update occurs at the same time). 1 = UART_BAUD is updated at the next received character. User must set the bit before checksum reception.</p> <p>Note 1: This bit only is valid in LIN slave mode (SLVEN (UART_LINCTL[0]) = 1).</p> <p>Note 2: This bit used for LIN Slave Automatic Resynchronization mode. (for Non-Automatic Resynchronization mode, this bit should be kept cleared)</p>

		Note 3: The control and interactions of this field are explained in 6.13.5.10 (Slave mode with automatic resynchronization).
[2]	SLVAREN	<p>LIN Slave Automatic Resynchronization Mode Enable Bit</p> <p>0 = LIN automatic resynchronization Disabled. 1 = LIN automatic resynchronization Enabled.</p> <p>Note 1: This bit only is valid in LIN slave mode (SLVEN (UART_LINCTL[0]) = 1).</p> <p>Note 2: When operation in Automatic Resynchronization mode, the baud rate setting must be mode2 (BAUDM1 (UART_BAUD [29]) and BAUDM0 (UART_BAUD [28]) must be 1).</p> <p>Note 3: The control and interactions of this field are explained in 6.13.5.10 (Slave mode with automatic resynchronization).</p>
[1]	SLVHDEN	<p>LIN Slave Header Detection Enable Bit</p> <p>0 = LIN slave header detection Disabled. 1 = LIN slave header detection Enabled.</p> <p>Note 1: This bit is only valid in LIN slave mode (SLVEN (UART_LINCTL[0]) = 1).</p> <p>Note 2: In LIN function mode, when detect header field (break + sync + frame ID), SLVHDETF (UART_LINSTS [0]) flag will be asserted. If the LINIEN (UART_INTEN[8]) = 1, an interrupt will be generated.</p>
[0]	SLVEN	<p>LIN Slave Mode Enable Bit</p> <p>0 = LIN slave mode Disabled. 1 = LIN slave mode Enabled.</p>

6.14 Smart Card Host Interface (SC)

6.14.1 Overview

The Smart Card Interface controller (SC controller) is based on ISO/IEC 7816-3 standard and fully compliant with PC/SC Specifications. It also provides status of card insertion/removal.

6.14.2 Features

- ISO 7816-3 T = 0, T = 1 compliant
- EMV2000 compliant
- One ISO 7816-3 port
- Separates receive/transmit 4 byte entry FIFO for data payloads
- Programmable transmission clock frequency
- Programmable receiver buffer trigger level
- Programmable guard time selection (11 ETU ~ 267 ETU)
- One 24-bit timer and two 8-bit timers for Answer to Request (ATR) and waiting times processing
- Supports auto direct / inverse convention function
- Supports transmitter and receiver error retry and error number limiting function
- Supports hardware activation sequence process, and the time between PWR on and CLK start is configurable
- Supports hardware warm reset sequence process
- Supports hardware deactivation sequence process
- Supports hardware auto deactivation sequence when detected the card removal
- Supports UART mode
 - Full duplex, asynchronous communications
 - Separates receiving / transmitting 4 bytes entry FIFO for data payloads
 - Supports programmable baud rate generator
 - Supports programmable receiver buffer trigger level
 - Programmable transmitting data delay time between the last stop bit leaving the TX-FIFO and the de-assertion by setting EGT (SCn_EGT[7:0])
 - Programmable even, odd or no parity bit generation and detection
 - Programmable stop bit, 1- or 2- stop bit generation

6.14.3 Block Diagram

The SC clock control and block diagram are shown in SC Clock Control Diagram (8-bit Pre-scale Counter in Clock Controller) and SC Controller Block Diagram. The SC controller is completely asynchronous design with two clock domains, PCLK and engine clock. Note that the PCLK should be higher than or equal to the frequency of engine clock.

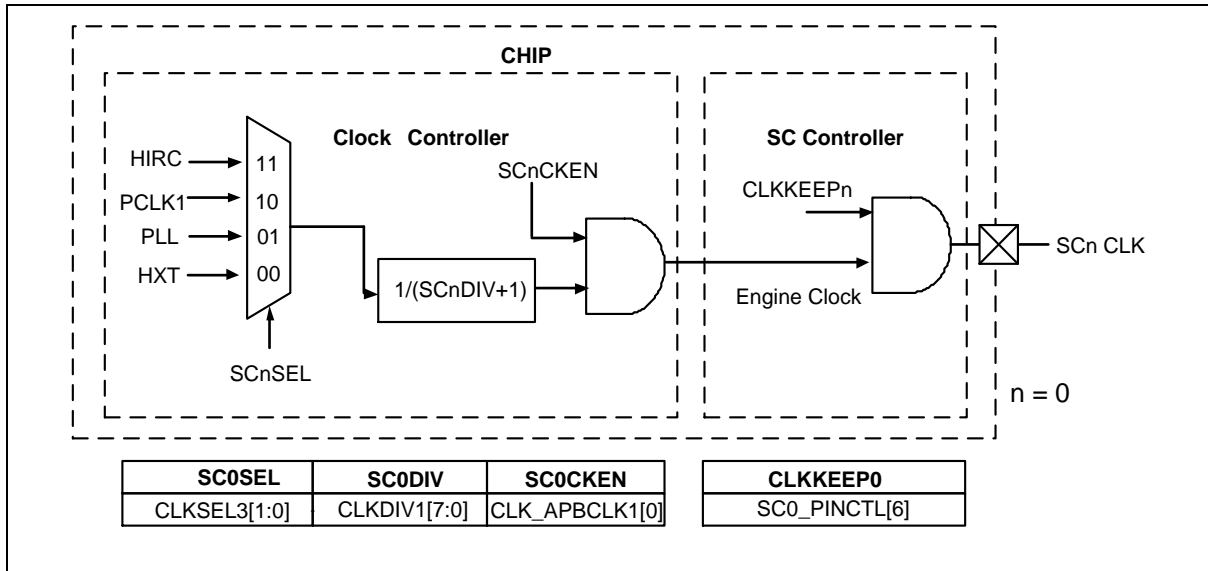

Figure 6.14-1 SC Clock Control Diagram (8-bit Pre-scale Counter in Clock Controller)

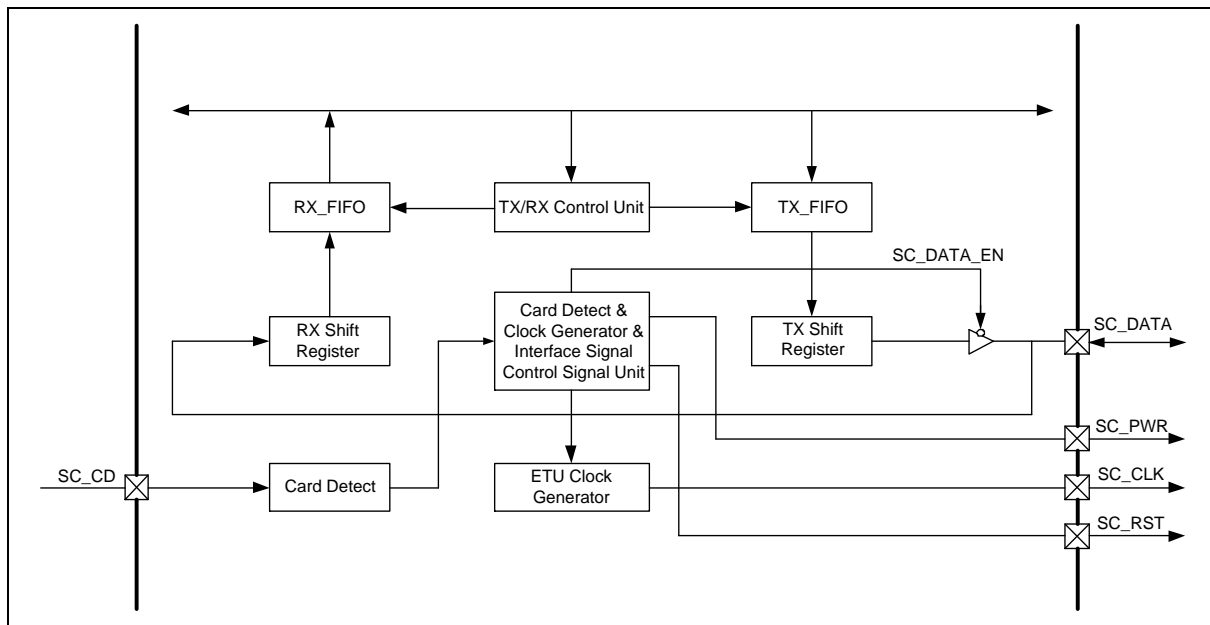

Figure 6.14-2 SC Controller Block Diagram

6.14.4 Basic Configuration

SC Host Controller Pin description is shown in:

Pin	Type	Description
SCn_DATA	Bi-direction	SC Host Controller DATA
SCn_CD	Input	SC Host Controller Card Detect
SCn_PWR	Output	SC Host Controller Power ON/OFF
SCn_CLK	Output	SC Host Controller Clock
SCn_RST	Output	SC Host Controller Reset

Table 6.14-1 SC Host Controller Pin Description

UART Mode Pin description is shown in UART Pin Description:

Pin	Type	Description
SCn_DATA	Input	UART Receive Data
SCn_CLK	Output	UART Transmit Data

Table 6.14-2 UART Pin Description

6.14.4.1 SC0 Basic Configuration

- Clock Source Configuration
 - Select the source of SC0 peripheral clock on SC0SEL (CLK_CLKSEL3[1:0]).
 - Select the clock divider number of SC0 peripheral clock on SC0DIV(CLK_CLKDIV1[7:0]).
 - Enable SC0 peripheral clock in SC0CKEN (CLK_APBCLK1[0]).
- Reset Configuration
 - Reset SC0 controller in SC0RST (SYS_IPRST2[0]).
- Pin Configuration

6.14.5 Functional Description

Basically, the smart card interface acts as a half-duplex asynchronous communication port and its data format is composed of ten consecutive bits which is shown in SC Data Character.

Figure 6.14-3 SC Data Character

The Smart Card Interface controller supports hardware activation, warm reset and deactivation sequence. The activation, warm reset and deactivation sequence are shown as follows.

6.14.5.1 Smart Card Pin Configuration

The Smart Card Interface pin status can be observed by polling following registers.

1. SCn_RST is a output pin. Its status can be observed by RSTSTS (SCn_PINCTL[18]). Programming RSTEN (SCn_PINCTL[1]) '0' or '1' can drive this output pin low or high.
2. SCn_PWR is a output pin. Its status can be observed by PWRSTS (SCn_PINCTL[17]). Programming PWREN (SCn_PINCTL[0]) to '0' or '1' can drive this output pin low or high. PWRINV (SCn_PINCTL[11]) can inverse the SCn_PWR output. User must select PWRINV (SCn_PINCTL[11]) before smart card is enabled by SCEN (SCn_CTL[0]).
3. SCn_DATA is a bidirectional pin, DATASTS(SCn_PINCTL[16]) shows the pin status when SC is receiving data. Programming SCDATA (SCn_PINCTL[9]) to '0' or '1' can drive this pin output low or high.
4. SCn_CLK is a output pin. It outputs Smart card clock SCn CLK. Programming CLKKEEP (SCn_PINCTL[6]) '0' or '1' to disable or enable this pin. Programming CSTOPLV (SCn_PINCTL[5]) can determine the SCn_CLK is stopped at high or low when this pin is disable.
5. SCn_CD(Card Detect Pin) state represent the status of the card is inserted or not. SCn_CD pin status can be observed by CDPINSTS(SCn_STATUS[13]). SCn_CD related function can be set by CDLV(SCn_CTL[26]), CDDBSSEL(SCn_CTL[25:24]), CDIF(SCn_INTSTS[7]), CDIEN(SCn_INTEN[7]).
6. CDLV(SCn_CTL[26]) determines what kind of pin level change represents the card insertion. CDDBSSEL(SCn_CTL[25:24]) determines the de-bounce cycles. When the card status CINSERT (SCn_STATUS[12]) or CREMOVE (SCn_STATUS[11]) is detected, CDIF will set to 1. If CDIEN is enable, SC will deliver a interrupt to CPU when CDIF is set to 1. Card Detect Pin is

recommend setting before enable SC.

6.14.5.2 Activation, Warm Reset and Deactivation Sequence

Activation

The activation sequence is shown in Figure 6.14-4:

1. Set SCn_RST to low by programming RSTEN (SCn_PINCTL[1]) to '0', and wait SYNC (SCn_PINCTL[31]) is cleared to 0.
2. Set SCn_PWR at high level by programming PWREN (SCn_PINCTL[0]) to '1' and SCn_DATA at high level (reception mode) by programming SCDATA (SCn_PINCTL[9]) to '1', and wait SYNC(SCn_PINCTL[31]) is cleared to 0.
3. Enable SCn_CLK clock by programming CLKKEEP (SCn_PINCTL[6]) to '1', and wait SYNC(SCn_PINCTL[31]) is cleared to 0.
4. De-assert SCn_RST to high by programming RSTEN (SCn_PINCTL[1]) to '1', and wait SYNC(SCn_PINCTL[31]) is cleared to 0.

The activation sequence can be controlled in two ways. The procedure is shown as follows:

- Software Timing Control:

Set SCn_PINCTL and SCn_TMRCTLx (x = 0, 1, 2) to process the activation sequence. SCn_PWR, SCn_CLK, SCn_RST and SCn_DATA pin state can be programmed by SCn_PINCTL. The programming method is shown in activation sequence. The activation sequence timing can be controlled by setting SCn_TMRCTLx (x = 0, 1, 2). This programming procedure provides user with a flexible timing setting for activation sequence.

- Hardware Timing Control:

Set ACTEN (SCn_ALTCTL[3]) to '1' and the interface will perform the activation sequence by hardware. The SCn_PWR to SCn_CLK start (T1) and SCn_CLK_start to SCn_RST assert (T2) can be selected by programming INITSEL (SCn_ALTCTL[9:8]). The SCn_PWR to SCn_CLK length can be configure by setting T1EXT(SCn_ACTCTL[4:0]). This programming procedure provides user with a simple setting for activation sequence. During the hardware activation, RX receive is disabled and can not receive data.

The following is activation control sequence in hardware activation mode:

1. Set activation timing by setting INITSEL (SCn_ALTCTL[9:8]).
2. Timer0 can be selected by setting TMRSEL (SCn_CTL[14:13]) is 11.
3. Set operation mode OPMODE (SCn_TMRCTL0[27:24]) to 0011 and give an Answer to Request (ATR) value by setting CNT (SCn_TMRCTL0[23:0]) register.
4. When hardware de-asserts SCn_RST to high, hardware will generator an interrupt INITIF (SCn_INTSTS[8]) to CPU at the same time if INITIEN (SCn_INTEN[8]) is 1.
5. If the Timer0 decreases the counter to "0" (started from SCn_RST de-assert) and the card does not response ATR before that time, hardware will generate an interrupt flag TMR0IF (SCn_INTSTS[3]).

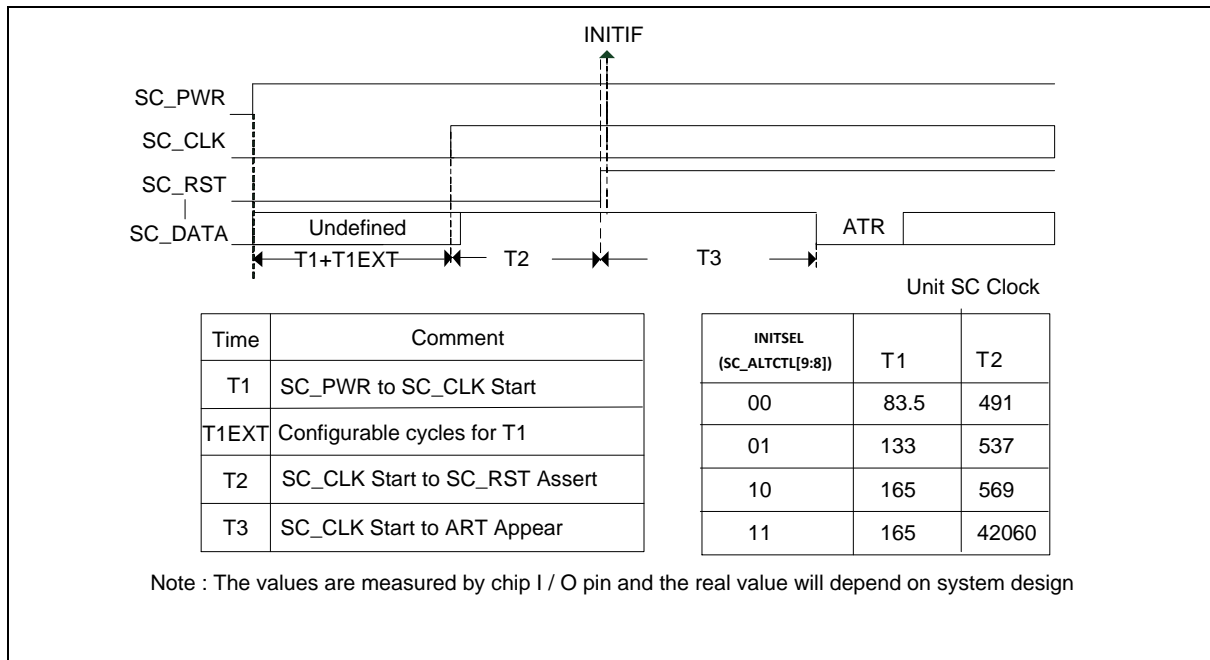

Figure 6.14-4 SC Activation Sequence

Warm Reset

The warm reset sequence is shown in Figure 6.14-5 :

1. Set SCn_RST to low by programming RSTEN (SCn_PINCTL[1]) to '0', and wait SYNC(SCn_PINCTL[31]) is cleared to 0.
2. Set SCn_DATA to high by programming SCDATA (SCn_PINCTL[9]) to '1', and wait SYNC(SCn_PINCTL[31]) is cleared to 0.
3. Set SCn_RST to high by programming RSTEN (SCn_PINCTL[1]) to '1', and wait SYNC(SCn_PINCTL[31]) is cleared to 0.

The warm reset sequence can be controlled in two ways. The procedure is shown as follows.

- Software Timing Control:

Set SCn_PINCTL and SCn_TMRCTLx (x = 0, 1, 2) to process the warm reset sequence. The SCn_RST and SCn_DATA pin state can be programmed by SCn_PINCTL. The warm reset sequence timing can be controlled by setting SCn_TMRCTLx (x = 0, 1, 2). This programming procedure provides user with a flexible timing setting for warm reset sequence.

- Hardware Timing Control:

Set WARSTEN (SCn_ALTCTL[4]) to '1' and the interface will perform the warm reset sequence by hardware. The SCn_RST to SCn_DATA reception mode (T4) and SCn_DATA reception mode to SCn_RST assert (T5) can be selected by programming INITSEL (SCn_ALTCTL[9:8]). This programming procedure provides user with a simple setting for warm reset sequence. During the hardware warm reset, RX receive is disabled and can not receive data.

The following is the warm reset control sequence by hardware:

1. Set warm reset timing by setting INITSEL (SCn_ALTCTL[9:8]).
2. Select Timer0 by setting TMRSEL (SCn_CTL[14:13]) to 11.
3. Set operation mode OPMODE (SCn_TMRCTL0[27:24]) to 0011 and give an Answer to Request

- (ATR) value by setting CNT (SCn_TMRCTL0[23:0]) register.
- Set CNTEN0 (SCn_ALTCTL[5]) and WARSTEN (SCn_ALTCTL[4]) to start counting.
 - When hardware de-asserts SCn_RST to high, hardware will generate an interrupt INITIF (SCn_INTSTS[8]) to CPU at the same time if INITIEN (SCn_INTEN[8]) is 1.
 - If the Timer0 decreases the counter to '0' (start from SCn_RST) and the card does not response ATR before that time, hardware will generate an interrupt flag TMR0IF (SCn_INTSTS[3]).

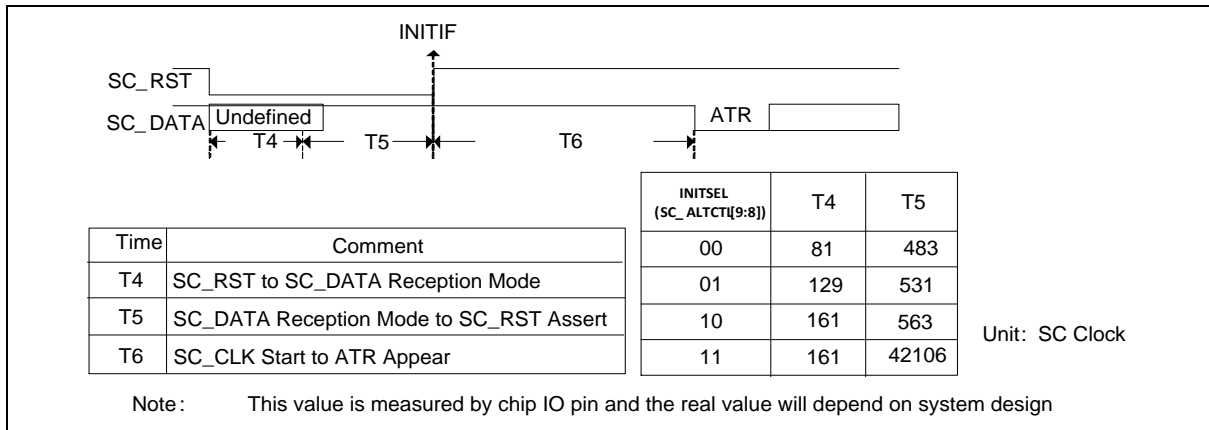

Figure 6.14-5 SC Warm Reset Sequence

Deactivation

The deactivation sequence is shown in Figure 6.14-6.

- Set SCn_RST to low by programming RSTEN (SCn_PINCTL[1]) to '0', wait SYNC(SCn_PINCTL[31]) is cleared to 0.
- Stop SCn_CLK by programming CLKKEEP (SCn_PINCTL[6]) to '0', wait SYNC(SCn_PINCTL[31]) is cleared to 0.
- Set SCn_DATA to low by programming SCDATA (SCn_PINCTL[9]) to '0', wait SYNC(SCn_PINCTL[31]) is cleared to 0.
- Deactivate SCn_PWR by programming PWREN (SCn_PINCTL[0]) to '0', wait SYNC(SCn_PINCTL[31]) is cleared to 0.

The deactivation sequence can be controlled in two ways. The procedure is shown as follows.

- Software Timing Control:

Set SCn_PINCTL and SCn_TMRCTL0 to process the deactivation sequence. SCn_PWR, SCn_CLK, SCn_RST and SCn_DATA pin state can be programmed by SCn_PINCTL. The deactivation sequence timing can be controlled by setting SCn_TMRCTL0. This programming procedure provides user with a flexible timing setting for deactivation sequence.

- Hardware Timing Control:

DACTEN (SCn_ALTCTL[2]) to '1' and the interface will perform the deactivation sequence by hardware. The Deactivation Trigger to SCn_RST low (T7), SMC_RST low to SCn_CLK (T8) and stop SCn_CLK to stop SCn_PWR (T9) time can be selected by programming INITSEL (SCn_ALTCTL[9:8]). This programming procedure provides user with a simple setting for deactivation sequence.

When hardware de-asserts SCn_PWR to low, the SC controller will generate an interrupt INITIF (SCn_INTSTS[8]) to CPU at the same time if INITIEN (SCn_INTEN[8]) is 1.

The SC controller also supports auto deactivation sequence when the card removal detection is enabled

by setting ADACEN (SCn_ALTCTL[11]).

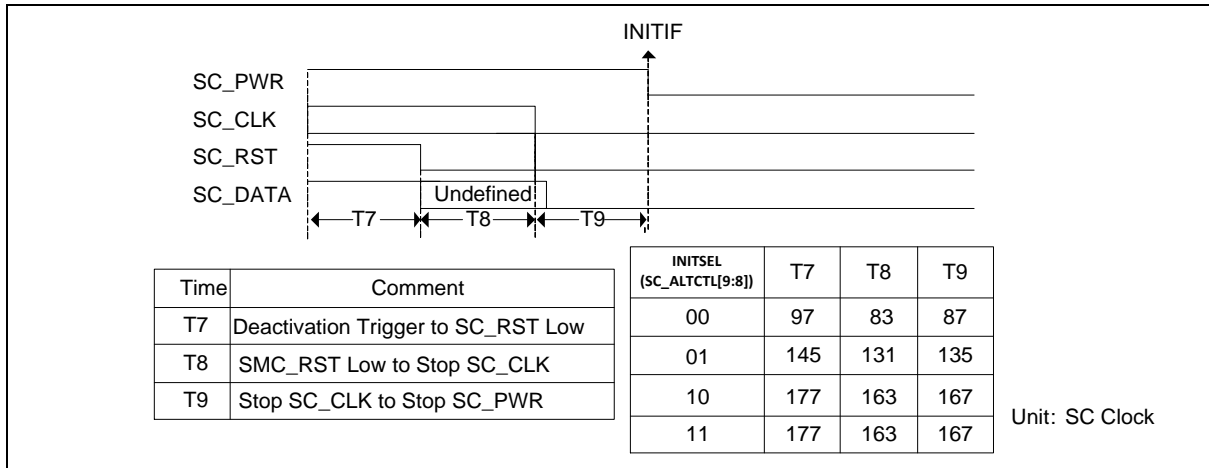

Figure 6.14-6 SC Deactivation Sequence

6.14.5.3 Basic Operation Flow

Basic operation flow of smartcard can be referenced from ISO 7816-3 & EMV.

The Program Sequence Flow is shown as follows:

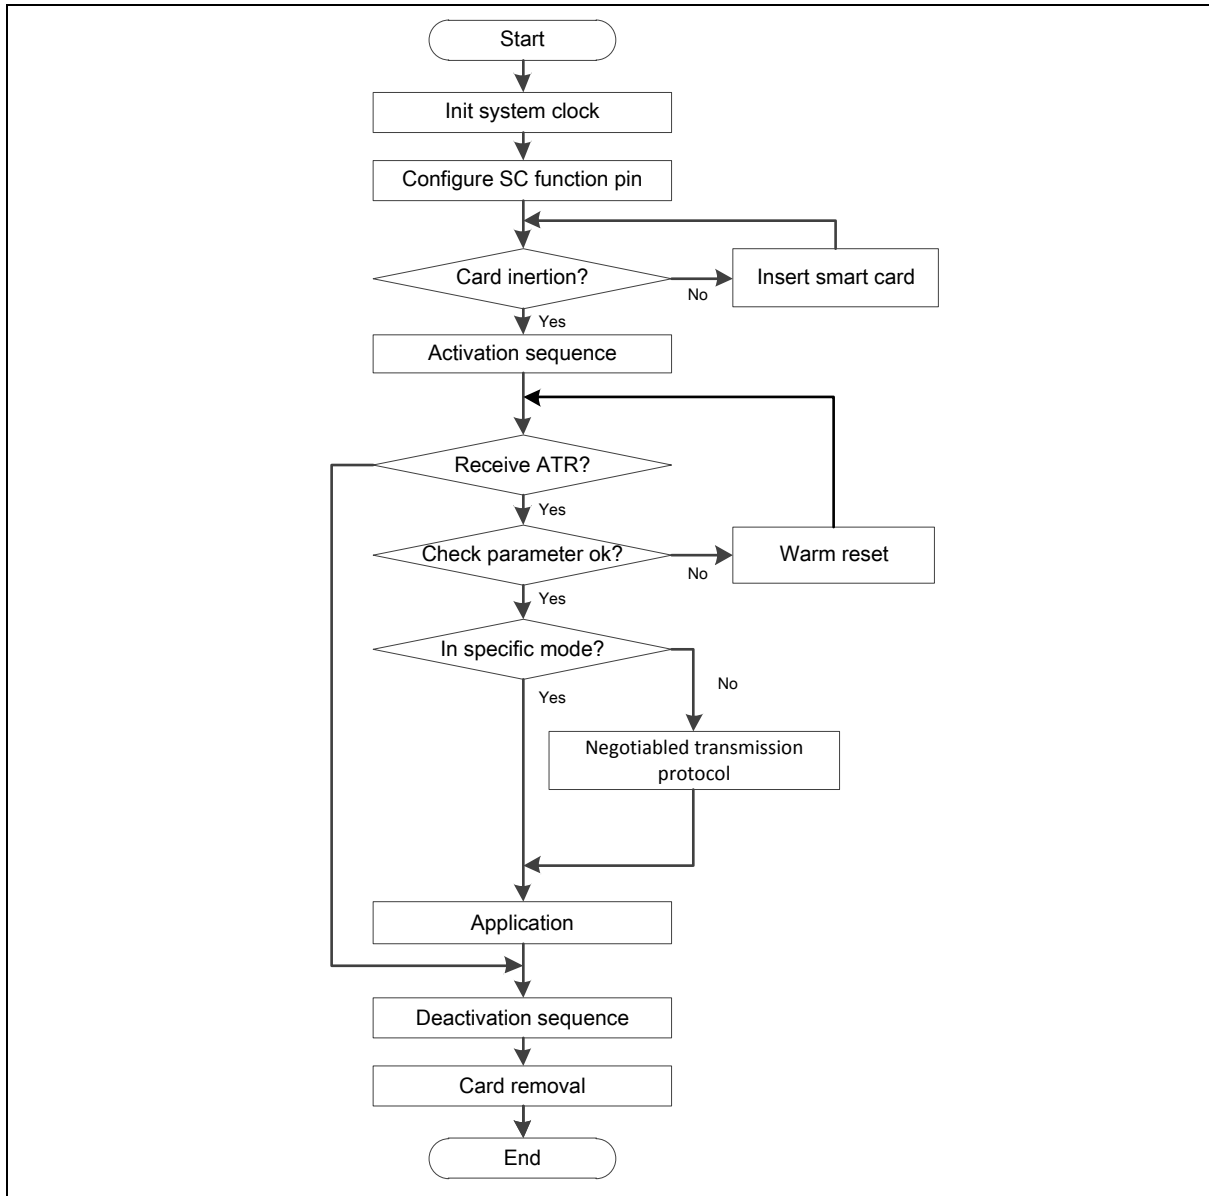

Figure 6.14-7 Basic Operation Flow

6.14.5.4 Initial Character TS

According to ISO 7816-3, the initial character TS has two possible patterns shown in Figure 6.14-8. If the TS pattern is 1100_0000, it is inverse convention. When decoded by inverse convention, the conveyed byte is equal to 0x3F. If the TS pattern is 1101_1100, it is direct convention. When decoded by direct convention, the conveyed byte is equal to 0x3B. User can set AUTOCON (SCn_CTL[3]) and then the operating convention will be decided by hardware. User can also set the CONSEL (SCn_CTL[5:4]) register (set to '00' or '11') to change the operating convention after SC received TS of answer to request (ATR).

If auto convention function is enabled by setting AUTOCON (SCn_CTL[3]) register, the setting step must be done before Answer to Request (ATR) state and the received first data must be 0x3B or 0x3F. After hardware received first data and stored it at SCn_DAT, the hardware will decide the convention and change the CONSEL (SCn_CTL[5:4]) register automatically. If the received first data is neither 0x3B nor 0x3F, ACERRIF (SCn_INTSTS[10] Auto Convention Error Interrupt Status Flag) will be set and the hardware will generate an interrupt to CPU if ACERRIEN (SCn_INTEN[10]) is 1.

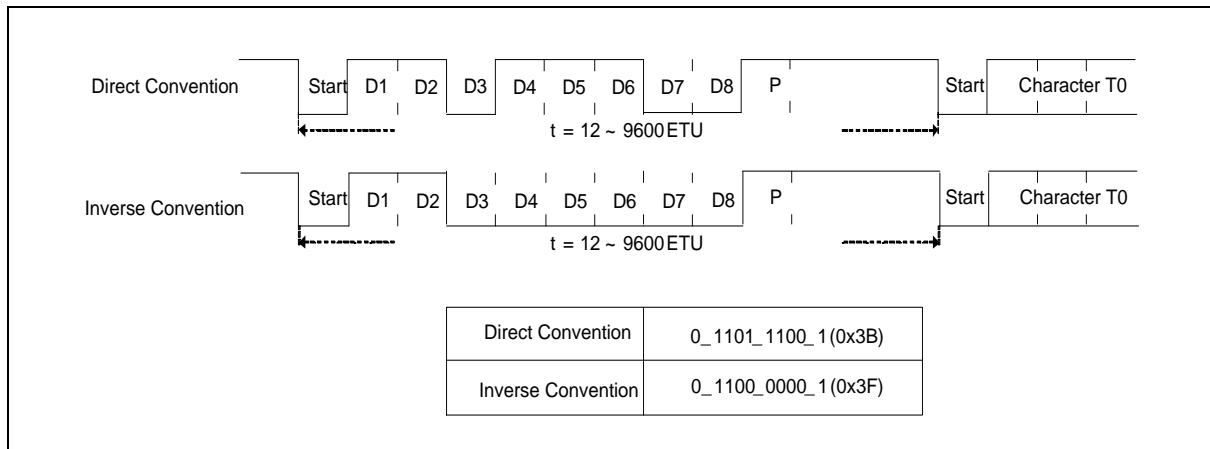

Figure 6.14-8 Initial Character TS

6.14.5.5 Transfer Data Flow and Data Buffer Status

After setting initial sequence, SC can start transferring data which format is corresponding to ISO 7816-3. Set ETURDIV(SCn_ETUCTL[11:0]) to 273 to make ETU(Element Timing Unit) meet ISO 7816-3. Writing data to SCn_DAT, SC will send out an 8-bit data to smart card. Reading data from SCn_DAT, SC will return an 8-bit received data from smart card.

Data buffer status show in SCn_STATUS. TXPOINT(SCn_STATUS[26:24]) and RXPOINT(SCn_STATUS[18:16]) represent how many data in transmit buffer and received buffer. TXEMPTY(SCn_STATUS[9]), TXFULL(SCn_STATUS[10]), TXOV(SCn_STATUS[8]), RXEMPTY(SCn_STATUS[1]), RXFULL(SCn_STATUS[2]), RXOV(SCn_STATUS[0]), represent the transmitted/received buffer status is full, empty, or overflow. SC even can generate interrupt for the transmit buffer empty situation by setting TBEIEN(SCn_INTEN[1]) bit. After interrupt status flag TBEIF(SCn_INTSTS[1]) is generated, user can decide to transfer data or not by polling these flag and it only can be cleared automatically when write data to SCn_DAT again.

TX and RX can be disabled seperately by setting TXOFF(SCn_CTL[2]) and RXOFF(SCn_CTL[1]). TXACT(SCn_STATUS[31]) and RXACT(SCn_STATUS[23]) represent the TX transfer/RX transfer is active or not.

6.14.5.6 Receiver Buffer Time-out

The time-out down counter resets and starts counting whenever the RX buffer received a new data. Once the counter decrease to 1 and no new data is received or CPU does not read data by reading SCn_DAT, a receiver time-out flag RXTOIF (SCn_INTSTS[9]) will be set, and hardware will generate an interrupt to CPU when RXTOIEN (SCn_INTEN[9]) is enabled.

6.14.5.7 Error Signal and Character Repetition

According to ISO 7816-3 T=0 mode description, as shown in Figure 6.14-9, if the receiver receives a wrong parity bit, it will pull the SCn_DAT to low by 1.5 bit period to inform the transmitter parity error. Then the transmitter will retransmit the character. The SC interface controller supports hardware error detection function in receiver and supports hardware re-transmit function in transmitter.

User can enable re-transmit function by setting TXRTYEN (SCn_CTL[23]). User can also define the retry (re-transmit) number limitation in TXRTY (SCn_CTL[22:20]). If the re-transmit number is between 1 and TXRTY, TXRERR (SCn_STATUS[29]) flag will be set by hardware. The re-transmit number is up to TXRTY +1 and if the re-transmit number is equal to TXRTY +1, TXOVERR (SCn_STATUS[30]) flag will be set by hardware and if TERRIEN (SCn_INTEN[2]) is enabled, SC controller will generate a transfer error interrupt to CPU, and TERRIF (SCn_INTSTS[2]) flag will also be set.

User can also enable re-received function by setting RXRTYEN (SCn_CTL[19]).The received retry number limitation is defined in RXRTY (SCn_CTL[18:16]). If the re-received number is between 1 and RXRTY, RXRERR (SCn_STATUS[21]) flag will be set by hardware. The receiver retry number is up to

RXRTY +1, if the number of received errors by receiver is equal to RXRTY +1, receiver will receive this error data to buffer and RXOVERR (SCn_STATUS[22]) flag will be set by hardware and if TERRIEN (SCn_INTEN[2]) is enabled, SC controller will generate a transfer error interrupt to CPU, and TERRIF (SC_INTSTS[2]) flag will also be set.

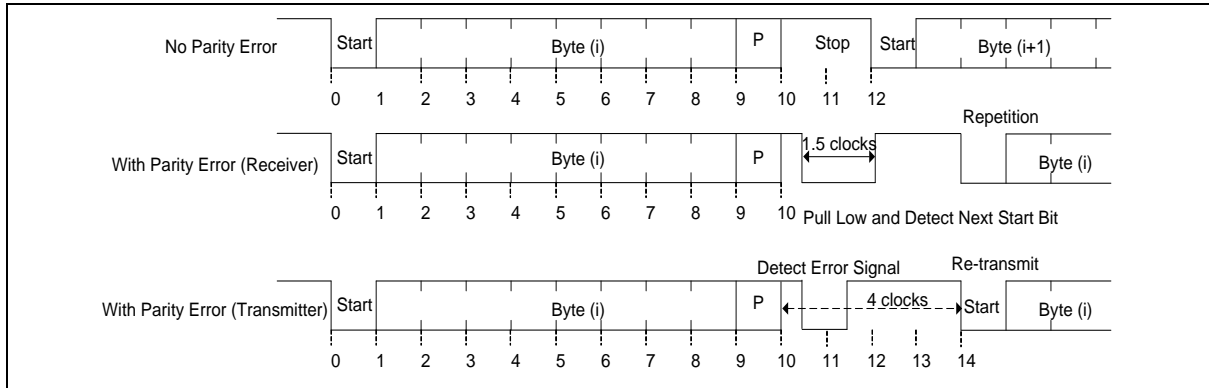

Figure 6.14-9 SC Error Signal

6.14.5.8 Internal Timer Operation Mode

The smart card interface includes a 24-bit time-out counter and two 8 bit time-out counters. These counters help the controller in processing different real-time interval. Each counter can be set to start counting once the trigger enable bit (CNTENx in SCn_ALTCTL[7:5], x = 0, 1, 2) has been written or a START bit has been detected.

The following is the programming flow:

1. Enable counter by setting TMRSEL (SCn_CTL[14:13]) to 11.
2. Select operation mode OPMODE (SCn_TMRCTLx[27:24], x = 0, 1, 2).
3. Give a count value CNT for Timer0, Timer1 and Timer2 by setting CNT0(SCn_TMRCTL0[23:0]), CNT1(SCn_TMRCTL1[7:0]) and CNT2(SCn_TMRCTL2[7:0]) register).
4. Set CNTEN0 (SCn_ALTCTL [5]), CNTEN1 (SCn_ALTCTL [6]) or CNTEN2 (SCn_ALTCTL [7]) to enable timer. ACTSTS0(SCn_ALTCTL[13]), ACTSTS1(SCn_ALTCTL[14]) and ACTSTS2(SCn_ALTCTL[15]) represent the status that timer is enable or not.
5. Wait until the counting condition is satisfied, the timer start counting.
6. When internal timer counter satisfied interrupt conditions in different modes and TMR0IEN(SCn_INTEN[3]), TMR1IEN(SCn_INTEN[4]), TMR2IEN(SCn_INTEN[5]) are enable, SC will generate a interrupt to CPU.

The SCn_TMRCTL0, SCn_TMRCTL1 and SCn_TMRCTL2 timer operation mode are listed in Table 6.14-3.

Note1: Only Timer0 (SCn_TMRCTL0 register) supports mode 0011.

Note2: START bit can only be detected when Tx or Rx is idle or finish the last transmission.

OPMODE (SCn_TMRCTLx[27:24]), X = 0, 1, 2)	Operation Mode Description	
0000	The down counter is started when CNTENx (SCn_ALTCTL[7:5]) enabled and ended when counter time-out. The time-out counter value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.	
	Start	Start counting when CNTENx (SCn_ALTCTL[7:5]) enabled.

	End	When the down counter equals 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and clear CNTENx (SCn_ALTCTL[7:5]) automatically.
0001		The down counter is started when the first START bit (reception or transmission) detected and ended when counter time-out. It takes 2 ETU to detect first START bit after writing data to Tx or receiving data from Rx. The time-out counter value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.
	Start	Start counting when the first START bit (reception or transmission) detected after CNTENx (SCn_ALTCTL[7:5]) set to 1.
	End	When the down counter equals 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and clear CNTENx (SCn_ALTCTL[7:5]) automatically.
0010		The down counter is started when the first START bit (reception) detected and ended when counter time-out. It takes 2 ETU to detect first START bit after receiving data from Rx. The time-out value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.
	Start	Start counting when the first START bit (reception) detected bit after CNTENx (SCn_ALTCTL[7:5]) set to 1.
	End	When the down counter equals 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and clear CNTENx (SCn_ALTCTL[7:5]) automatically.
0011		The down counter is only used for hardware activation, warm reset sequence to measure ATR timing. The timing starts when SCn_RST de-assertion and ends when ATR response received or time-out. If the counter decreases to 0 before ATR response received, hardware will set TMR0IF (SCn_INTSTS[3]) and generate an interrupt to CPU if TMR0IEN (SCn_INTEN[3]) enabled. The time-out value will be CNT (SCn_TMRCTL0[23:0]) +1.
	Start	Start counting when SCn_RST de-assertion after CNTEN0 (SCn_ALTCTL[5]) set to 1. It is only used for hardware activation, warm reset mode.
	End	When the down counter equals 0 before ATR response received, hardware will set TMR0IF and clear CNTEN0 (SCn_ALTCTL[5]) automatically. When ATR received and down counter does not equal to 0, hardware will clear CNTEN0 (SCn_ALTCTL[5]) automatically.
0100	Start	Start down counter counting when CNTENx (SCn_ALTCTL[7:5]) enabled.
	Recount & reload	When ACTSTSx (SCn_ALTCTL[15:13]) is 1, user can change CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL0[7:0], SCn_TMRCTL0[7:0]) value at any time. It will reload the last value which is filled into the CNT(SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) before the counter count to 0. Only when the down counter equals 0, counter reload the CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) value and start to recount.
	Interrupt	If the counter decreases to 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and generate an interrupt to CPU if TMRxIEN (SCn_INTEN[5:3]) enabled. The time-out value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.
	End	The down counter stopped when user clears CNTENx (SCn_ALTCTL[7:5]) bit.
0101	Start	The down counter is started when the first START bit (reception or transmission) detected after CNTENx (SCn_ALTCTL[7:5]) set to 1. It takes 2 ETU to detect START bit after writing data to Tx or receiving data from Rx.
	Reload	When ACTSTSx (SCn_ALTCTL[15:13]) is 1, user can change CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL0[7:0], SCn_TMRCTL0[7:0]) value at any time. It will reload the last value which is filled into the CNT(SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) before the counter count to 0. Only when the down counter equals 0, counter will reload the CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) value.

	Recount	After down counter reloads the CNT value, timer counter starts to recount only when the next START bit is detected.
	Interrupt	If the counter decreases to 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and generate an interrupt to CPU if TMRxIEN (SCn_INTEN[5:3]) enabled. The time-out value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.
	End	The down counter stopped when user clears CNTENx (SCn_ALTCTL[7:5]) bit.
0110	Start	The down counter is started when the first START bit (reception) detected after CNTENx (SCn_ALTCTL[7:5]) set to 1. It takes 2 ETU to detect START bit after writing data to Tx or receiving data from Rx.
	Reload	When ACTSTSx (SCn_ALTCTL[15:13]) is 1, user can change CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL0[7:0], SCn_TMRCTL0[7:0]) value at any time. It will reload the last value which is filled into the CNT(SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) before the counter counts to 0. Only when the down counter equals 0, counter reload the CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) value.
	Recount	After the down counter reloads the CNT value, timer counter starts to recount only when the next START bit is detected.
	Interrupt	If the counter decreases to 0, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and generate an interrupt to CPU if TMRxIEN (SCn_INTEN[5:3]) enabled. The time-out value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0])+1.
	End	The down counter stopped when user clears CNTENx (SCn_ALTCTL[7:5]) bit.
0111	Start	The down counter is started when the first START bit (reception or transmission) detected after CNTENx (SCn_ALTCTL[7:5]) set to 1. It takes 2 ETU to detect START bit after writing data to Tx or receiving data from Rx.
	Reload &recount	Only when the next START bit is detected, counter will reload the new value of CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) and recount.
	Interrupt	If the counter decreases to 0 before the next START bit detected, hardware will set TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]) and generate an interrupt to CPU if TMRxIEN (SCn_INTEN[5:3]) enabled. The time-out value will be CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.
	End	The down counter stopped when user clears CNTENx (SCn_ALTCTL[7:5]) bit.
1111	Start	The down counter starts counting when user sets CNTENx (SCn_ALTCTL[7:5]) bit and it will count to time-out.
	Reload &recount	Only when the next START bit is detected, counter will reload the new value of CNT (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) and recount.
	Interrupt	If the counter decreases to 0 before the next START bit detected, hardware will generate time-out interrupt flag TMR0IF, TMR1IF, TMR2IF (SCn_INTSTS[5:3]). The time-out value will be CNTx (SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0], SCn_TMRCTL2[7:0]) +1.
	End	The down counter stopped when user clears CNTENx (SCn_ALTCTL[7:5]) bit.

Table 6.14-3 Timer0/Timer1/Timer2 Operation Mode

6.14.5.9 Block Guard Time and Extra Guard Time

Block guard time means the minimum interval between the leading edges of two consecutive characters between different transfer directions. This field indicates the counter for the bit length of block guard time. According to ISO7816-3, in T = 0 mode, user must fill 15 (real block guard time = 16.5) to this field;

in T = 1 mode, user must fill 21 (real block guard time = 22.5) to it.

In transmit direction, the smart card sends data to smart card host controller, first. After the period is greater than BGT (SCn_CTL[12:8]), the smart card host controller begin to send the data.

Figure 6.14-10 Transmit Direction Block Guard Time Operation

In receive direction, the smart card host controller sends data to smart card, first. If the smart card responses data to smart card host controller at the time which is less than BGT (SCn_CTL[12:8]), the block guard time interrupt BGTIF (SC_INTSTS[6]) is generated when RXBGTEN (SCn_ALTCTL[12]) and BGTIEN(SCn_INTEN[6]) is enabled.

Figure 6.14-11 Receive Direction Block Guard Time Operation

Extra Guard Time is EGT (SCn_EGT[7:0]), it only affects the data transmitted by smart card interface, the format is shown as Figure 6.14-12 Figure 6.14-11.

Figure 6.14-12 Extra Guard Time Operation

6.14.5.10 UART Mode

When the UARTEN (SCn_UARTCTL[0]) bit is set, the Smart Card Interface controller can also be used as basic UART function. The following is the program example for UART mode.

Programming example:

1. Set UARTEN (SCn_UARTCTL[0]) bit to enter UART mode.
2. Do user reset by setting RXRST (SCn_ALTCTL[1]) and TXRST(SCn_ALTCTL[0]) bit to ensure that all state machine return idle state.
3. Fill "0" to CONSEL (SCn_CTL[5:4]) and AUTOCEN (SCn_CTL[3]) field. In UART mode, those fields must be "0".
4. Select the UART baud rate by setting ETURDIV (SCn_ETUCTL[11:0]) fields. For example, if smartcard module clock is 12 MHz and target baud rate is 115200 bps, ETURDIV should fill with ((12000000 / 115200) - 1).
5. Select the data format include data length (by setting WLS (SCn_UARTCTL[5:4]), parity format

(by setting OPE (SCn_UARTCTL[7]) and PBOFF (SCn_UARTCTL[6])) and stop bit length (by setting NSB (SCn_CTL[15] or EGT (SCn_EGT[7:0])).

6. Select the receiver buffer number trigger level by setting RXTRGLV (SCn_CTL[7:6]) field and select the receiver buffer time-out interval by setting RFTM (SCn_RXTOUT[8:0]) field.
7. Write the SCn_DAT (SCn_DAT[7:0]) (TX) register or read the SCn_DAT (SCn_DAT[7:0]) (RX) register can perform UART function.

DAT							

Bits	Description	
[31:8]	Reserved	Reserved.
[7:0]	DAT	<p>Receive/Transmit Holding Buffer</p> <p>Write Operation: By writing data to DAT, the SC will send out an 8-bit data.</p> <p>Note: If SCEN (SCn_CTL[0]) is not enabled, DAT cannot be programmed.</p> <p>Read Operation: By reading DAT, the SC will return an 8-bit received data.</p>

SC Control Register (SC_CTL)

Register	Offset	R/W	Description	Reset Value
SC_CTL	SCn_BA+0x04	R/W	SC Control Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved	SYNC	Reserved			CDLV	CDBSEL	
23	22	21	20	19	18	17	16
TXRTYEN	TXRTY			RXRTYEN	RXRTY		
15	14	13	12	11	10	9	8
NSB	TMRSEL		BGT				
7	6	5	4	3	2	1	0
RXTRGLV		CONSEL		AUTOEN	TXOFF	RXOFF	SCEN

Bits	Description
[31]	Reserved Reserved.
[30]	SYNC SYNC Flag Indicator (Read Only) Due to synchronization, user should check this bit before writing a new value to RXRTY and TXRTY fields. 0 = Synchronizing is completion, user can write new data to RXRTY and TXRTY. 1 = Last value is synchronizing.
[29:27]	Reserved Reserved.
[26]	CDLV Card Detect Level Selection 0 = When hardware detects the card detect pin (SCn_CD) from high to low, it indicates a card is detected. 1 = When hardware detects the card detect pin (SCn_CD) from low to high, it indicates a card is detected. Note: User must select card detect level before Smart Card controller enabled.
[25:24]	CDBSEL Card Detect De-bounce Selection This field indicates the card detect de-bounce selection. 00 = De-bounce sample card insert once per 384 (128 * 3) SC module clocks and de-bounce sample card removal once per 128 SC module clocks. Other configurations are reserved.
[23]	TXRTYEN TX Error Retry Enable Bit This bit enables transmitter retry function when parity error has occurred. 0 = TX error retry function Disabled. 1 = TX error retry function Enabled.
[22:20]	TXRTY TX Error Retry Count Number This field indicates the maximum number of transmitter retries that are allowed when parity error has occurred. Note 1: The real retry number is TXRTY + 1, so 8 is the maximum retry number. Note 2: This field cannot be changed when TXRTYEN enabled. The change flow is to disable TXRTYEN first and then fill in new retry value.

[19]	RXRTYEN	<p>RX Error Retry Enable Bit</p> <p>This bit enables receiver retry function when parity error has occurred.</p> <p>0 = RX error retry function Disabled.</p> <p>1 = RX error retry function Enabled.</p> <p>Note: User must fill in the RXRTY value before enabling this bit.</p>
[18:16]	RXRTY	<p>RX Error Retry Count Number</p> <p>This field indicates the maximum number of receiver retries that are allowed when parity error has occurred</p> <p>Note 1: The real retry number is RXRTY + 1, so 8 is the maximum retry number.</p> <p>Note 2: This field cannot be changed when RXRTYEN enabled. The change flow is to disable RXRTYEN first and then fill in new retry value.</p>
[15]	NSB	<p>Stop Bit Length</p> <p>This field indicates the length of stop bit.</p> <p>0 = The stop bit length is 2 ETU.</p> <p>1 = The stop bit length is 1 ETU.</p> <p>Note 1: The default stop bit length is 2. SC and UART adopts NSB to program the stop bit length.</p> <p>Note 2: In UART mode, RX can receive the data sequence in 1 stop bit or 2 stop bits with NSB is set to 0.</p>
[14:13]	TMRSEL	<p>Timer Channel Selection</p> <p>00 = All internal timer function Disabled.</p> <p>11 = Internal 24 bit timer and two 8 bit timers Enabled. User can configure them by setting SCn_TMRCTL0[23:0], SCn_TMRCTL1[7:0] and SCn_TMRCTL2[7:0].</p> <p>Other configurations are reserved</p>
[12:8]	BGT	<p>Block Guard Time (BGT)</p> <p>Block guard time means the minimum interval between the leading edges of two consecutive characters between different transfer directions. This field indicates the counter for the bit length of block guard time. According to ISO 7816-3, in T = 0 mode, user must fill 15 (real block guard time = 16.5) to this field; in T = 1 mode, user must fill 21 (real block guard time = 22.5) to it.</p> <p>Note: The real block guard time is BGT + 1.</p>
[7:6]	RXTRGLV	<p>Rx Buffer Trigger Level</p> <p>When the number of bytes in the receiving buffer equals the RXTRGLV, the RDAIF will be set. If RDAIEN (SCn_INTEN[0]) is enabled, an interrupt will be generated to CPU.</p> <p>00 = Rx Buffer Trigger Level with 01 bytes.</p> <p>01 = Rx Buffer Trigger Level with 02 bytes.</p> <p>10 = Rx Buffer Trigger Level with 03 bytes.</p> <p>11 = Reserved.</p>
[5:4]	CONSEL	<p>Convention Selection</p> <p>00 = Direct convention.</p> <p>01 = Reserved.</p> <p>10 = Reserved.</p> <p>11 = Inverse convention.</p> <p>Note: If AUTOCEN (SCn_CTL[3]) is enabled, this field is ignored.</p>
[3]	AUTOCEN	<p>Auto Convention Enable Bit</p> <p>This bit is used for enable auto convention function.</p> <p>0 = Auto-convention Disabled.</p> <p>1 = Auto-convention Enabled.</p>

		<p>Note 1: If user enables auto convention function, the setting step must be done before Answer to Reset (ATR) state and the first data must be 0x3B or 0x3F. After hardware received first data and stored it at buffer, hardware will decided the convention and change the CONSEL (SCn_CTL[5:4]) bits automatically when received first data is 0x3B or 0x3F. If received first byte is 0x3B, TS is direct convention, CONSEL (SCn_CTL[5:4]) will be set to 00 automatically, otherwise the TS is inverse convention, and CONSEL (SCn_CTL[5:4]) will be set to 11.</p> <p>Note 2: If the first data is not 0x3B or 0x3F, hardware will set ACERRIF (SCn_INTSTS[10]) and generate an interrupt to CPU when ACERRIEN (SCn_INTEN[10]) is enabled.</p>
[2]	TXOFF	<p>TX Transition Disable Control Bit This bit is used for disable Tx transition function. 0 = The transceiver Enabled. 1 = The transceiver Disabled.</p>
[1]	RXOFF	<p>RX Transition Disable Control Bit This bit is used for disable Rx transition function. 0 = The receiver Enabled. 1 = The receiver Disabled. Note: If AUTOCEN (SCn_CTL[3]) is enabled, this field is ignored.</p>
[0]	SCEN	<p>SC Controller Enable Bit Set this bit to 1 to enable SC operation. If this bit is cleared, 0 = SC will force all transition to IDLE state. 1 = SC controller is enabled and all function can work correctly. Note: SCEN must be set to 1 before filling in other SC registers, or smart card will not work properly.</p>

SC Alternate Control Register (SC_ALTCTL)

Register	Offset	R/W	Description	Reset Value
SC_ALTCTL	SCn_BA+0x08	R/W	SC Alternate Control Register	0x0000_0000

31	30	29	28	27	26	25	24
SYNC	Reserved						
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
ACTSTS2	ACTSTS1	ACTSTS0	RXBGTEN	ADACEN	Reserved	INITSEL	
7	6	5	4	3	2	1	0
CNTEN2	CNTEN1	CNTEN0	WARSTEN	ACTEN	DACTEN	RXRST	TXRST

Bits	Description
[31]	<p>SYNC</p> <p>SYNC Flag Indicator (Read Only) Due to synchronization, user should check this bit when writing a new value to SCn_ALTCTL register. 0 = Synchronizing is completion, user can write new data to SCn_ALTCTL register. 1 = Last value is synchronizing.</p>
[30:16]	<p>Reserved</p> <p>Reserved.</p>
[15]	<p>ACTSTS2</p> <p>Internal Timer2 Active Status (Read Only) This bit indicates the timer counter status of timer2. 0 = Timer2 is not active. 1 = Timer2 is active. Note: Timer2 is active does not always mean timer2 is counting the CNT (SCn_TMRCTL2[7:0]).</p>
[14]	<p>ACTSTS1</p> <p>Internal Timer1 Active Status (Read Only) This bit indicates the timer counter status of timer1. 0 = Timer1 is not active. 1 = Timer1 is active. Note: Timer1 is active does not always mean timer1 is counting the CNT (SCn_TMRCTL1[7:0]).</p>
[13]	<p>ACTSTS0</p> <p>Internal Timer0 Active Status (Read Only) This bit indicates the timer counter status of timer0. 0 = Timer0 is not active. 1 = Timer0 is active. Note: Timer0 is active does not always mean timer0 is counting the CNT (SCn_TMRCTL0[23:0]).</p>
[12]	<p>RXBGTEN</p> <p>Receiver Block Guard Time Function Enable Bit This bit enables the receiver block guard time function. 0 = Receiver block guard time function Disabled. 1 = Receiver block guard time function Enabled.</p>

[11]	ADACEN	<p>Auto Deactivation When Card Removal</p> <p>This bit is used for enable hardware auto deactivation when smart card is removed.</p> <p>0 = Auto deactivation Disabled.</p> <p>1 = Auto deactivation Enabled.</p> <p>Note: When the card is removed, hardware will stop any process and then do deactivation sequence if this bit is set. If auto deactivation process completes, hardware will set INITIF (SCn_INTSTS[8]) also.</p>
[10]	Reserved	Reserved.
[9:8]	INITSEL	<p>Initial Timing Selection</p> <p>This fields indicates the initial timing of hardware activation, warm-reset or deactivation. The unit of initial timing is SC module clock.</p> <p>Activation: refer to SC Activation Sequence in Figure 6.14-4.</p> <p>Warm-reset: refer to Warm-Reset Sequence in Figure 6.14-5.</p> <p>Deactivation: refer to Deactivation Sequence in Figure 6.14-6.</p> <p>Note: When set activation and warm reset in Timer0 operation mode 0011, it may have deviation at most 128 SC module clock cycles.</p>
[7]	CNTEN2	<p>Internal Timer2 Start Enable Bit</p> <p>This bit enables Timer 2 to start counting. User can fill 0 to stop it and set 1 to reload and count. The counter unit is ETU base.</p> <p>0 = Stops counting.</p> <p>1 = Start counting.</p> <p>Note 1: This field is used for internal 8 bit timer when TMRSEL (SCn_CTL[14:13]) is 11 only. Do not fill in CNTEN2 when TMRSEL (SCn_CTL[14:13]) is not equal to 11.</p> <p>Note 2: If the operation mode is not in auto-reload mode (SCn_TMRCTL2[26] = 0), this bit will be auto-cleared by hardware.</p> <p>Note 3: If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.</p>
[6]	CNTEN1	<p>Internal Timer1 Start Enable Bit</p> <p>This bit enables Timer 1 to start counting. User can fill 0 to stop it and set 1 to reload and count. The counter unit is ETU base.</p> <p>0 = Stops counting.</p> <p>1 = Start counting.</p> <p>Note 1: This field is used for internal 8 bit timer when TMRSEL(SCn_CTL[14:13]) is 11 only. Do not fill CNTEN1 when TMRSEL (SCn_CTL[14:13]) is not equal to 11.</p> <p>Note 2: If the operation mode is not in auto-reload mode (SCn_TMRCTL1[26] = 0), this bit will be auto-cleared by hardware.</p> <p>Note 3: If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.</p>
[5]	CNTEN0	<p>Internal Timer0 Start Enable Bit</p> <p>This bit enables Timer 0 to start counting. User can fill 0 to stop it and set 1 to reload and count. The counter unit is ETU base.</p> <p>0 = Stops counting.</p> <p>1 = Start counting.</p> <p>Note 1: This field is used for internal 24 bit timer when TMRSEL (SCn_CTL[14:13]) is 11 only.</p> <p>Note 2: If the operation mode is not in auto-reload mode (SCn_TMRCTL0[26] = 0), this bit will be auto-cleared by hardware.</p> <p>Note 3: If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.</p>
[4]	WARSTEN	<p>Warm Reset Sequence Generator Enable Bit</p> <p>This bit enables SC controller to initiate the card by warm reset sequence.</p> <p>0 = No effect.</p> <p>1 = Warm reset sequence generator Enabled.</p>

		<p>Note 1: When the warm reset sequence completed, this bit will be cleared automatically and the INITIF (SCn_INTSTS[8]) will be set to 1.</p> <p>Note 2: This field will be cleared by TXRST (SCn_ALTCTL[0]) and RXRST (SCn_ALTCTL[1]). Thus, do not fill in this bit WARSTEN, TXRST and RXRST at the same time.</p> <p>Note 3: If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.</p> <p>Note 4: During the warm reset sequence, RX is disabled automatically and can not receive data. After the warm reset sequence completion, RXOFF (SCn_CTL[1]) keeps the state before perform warm reset sequence.</p>
[3]	ACTEN	<p>Activation Sequence Generator Enable Bit</p> <p>This bit enables SC controller to initiate the card by activation sequence.</p> <p>0 = No effect.</p> <p>1 = Activation sequence generator Enabled.</p> <p>Note 1: When the activation sequence completed, this bit will be cleared automatically and the INITIF (SCn_INTSTS[8]) will be set to 1.</p> <p>Note 2: This field will be cleared by TXRST (SCn_ALTCTL[0]) and RXRST (SCn_ALTCTL[1]). Thus, do not fill in this bit ACTEN, TXRST and RXRST at the same time.</p> <p>Note 3: If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.</p> <p>Note 4: During the activation sequence, RX is disabled automatically and can not receive data. After the activation sequence completion, RXOFF (SCn_CTL[1]) keeps the state before hardware activation.</p>
[2]	DACTEN	<p>Deactivation Sequence Generator Enable Bit</p> <p>This bit enables SC controller to initiate the card by deactivation sequence.</p> <p>0 = No effect.</p> <p>1 = Deactivation sequence generator Enabled.</p> <p>Note 1: When the deactivation sequence completed, this bit will be cleared automatically and the INITIF (SCn_INTSTS[8]) will be set to 1.</p> <p>Note 2: This field will be cleared by TXRST (SCn_ALTCTL[0]) and RXRST (SCn_ALTCTL[1]). Thus, do not fill in this bit DACTEN, TXRST and RXRST at the same time.</p> <p>Note 3: If SCEN (SCn_CTL[0]) is not enabled, this filed cannot be programmed.</p>
[1]	RXRST	<p>Rx Software Reset</p> <p>When RXRST is set, all the bytes in the receive buffer and Rx internal state machine will be cleared.</p> <p>0 = No effect.</p> <p>1 = Reset the Rx internal state machine and pointers.</p> <p>Note: This bit will be auto cleared after reset is complete.</p>
[0]	TXRST	<p>TX Software Reset</p> <p>When TXRST is set, all the bytes in the transmit buffer and TX internal state machine will be cleared.</p> <p>0 = No effect.</p> <p>1 = Reset the TX internal state machine and pointers.</p> <p>Note: This bit will be auto cleared after reset is complete.</p>

SC Extra Guard Time Register (SC_EGT)

Register	Offset	R/W	Description	Reset Value
SC_EGT	SCn_BA+0x0C	R/W	SC Extra Guard Time Register	0x0000_0000

7	6	5	4	3	2	1	0
CDIEN	BGTIEN	TMR2IEN	TMR1IEN	TMR0IEN	TERRIEN	TBEIEN	RDAIEN

Bits	Description
[31:11]	Reserved Reserved.
[10]	ACERRIEN Auto Convention Error Interrupt Enable Bit This field is used to enable auto-convention error interrupt. 0 = Auto-convention error interrupt Disabled. 1 = Auto-convention error interrupt Enabled.
[9]	RXTOIEN Receiver Buffer Time-out Interrupt Enable Bit This field is used to enable receiver buffer time-out interrupt. 0 = Receiver buffer time-out interrupt Disabled. 1 = Receiver buffer time-out interrupt Enabled.
[8]	INITIEN Initial End Interrupt Enable Bit This field is used to enable activation (ACTEN (SCn_ALTCTL[3] = 1)), deactivation (DACTEN (SCn_ALTCTL[2] = 1)) and warm reset (WARSTEN (SCn_ALTCTL [4])) sequence complete interrupt. 0 = Initial end interrupt Disabled. 1 = Initial end interrupt Enabled.
[7]	CDIEN Card Detect Interrupt Enable Bit This field is used to enable card detect interrupt. The card detect status is CDPINSTS (SCn_STATUS[13]). 0 = Card detect interrupt Disabled. 1 = Card detect interrupt Enabled.
[6]	BGTIEN Block Guard Time Interrupt Enable Bit This field is used to enable block guard time interrupt in receive direction. 0 = Block guard time interrupt Disabled. 1 = Block guard time interrupt Enabled. Note: This bit is valid only for receive direction block guard time.
[5]	TMR2IEN Timer2 Interrupt Enable Bit This field is used to enable Timer2 interrupt function.

		0 = Timer2 interrupt Disabled. 1 = Timer2 interrupt Enabled.
[4]	TMR1IEN	Timer1 Interrupt Enable Bit This field is used to enable the Timer1 interrupt function. 0 = Timer1 interrupt Disabled. 1 = Timer1 interrupt Enabled.
[3]	TMR0IEN	Timer0 Interrupt Enable Bit This field is used to enable Timer0 interrupt function. 0 = Timer0 interrupt Disabled. 1 = Timer0 interrupt Enabled.
[2]	TERRIEN	Transfer Error Interrupt Enable Bit This field is used to enable transfer error interrupt. The transfer error states is at SCn_STATUS register which includes receiver break error BEF (SCn_STATUS[6]), frame error FEF (SCn_STATUS[5]), parity error PEF (SCn_STATUS[4]), receive buffer overflow error RXOV (SCn_STATUS[0]), transmit buffer overflow error TXOV (SCn_STATUS[8]), receiver retry over limit error RXOVERR (SCn_STATUS[22]) and transmitter retry over limit error TXOVERR (SCn_STATUS[30]). 0 = Transfer error interrupt Disabled. 1 = Transfer error interrupt Enabled.
[1]	TBEIEN	Transmit Buffer Empty Interrupt Enable Bit This field is used to enable transmit buffer empty interrupt. 0 = Transmit buffer empty interrupt Disabled. 1 = Transmit buffer empty interrupt Enabled.
[0]	RDAIEN	Receive Data Reach Interrupt Enable Bit This field is used to enable received data reaching trigger level RXTRGLV (SCn_CTL[7:6]) interrupt. 0 = Receive data reach trigger level interrupt Disabled. 1 = Receive data reach trigger level interrupt Enabled.

SC Interrupt Status Register (SC_INTSTS)

Register	Offset	R/W	Description	Reset Value
SC_INTSTS	SCn_BA+0x1C	R/W	SC Interrupt Status Register	0x0000_0002

31	30	29	28	27	26	25	24

Reserved					ACERRIF	RXTOIF	INITIF
7	6	5	4	3	2	1	0
CDIF	BGTIF	TMR2IF	TMR1IF	TMR0IF	TERRIF	TBEIF	RDAIF

Bits	Description
[31:11]	Reserved Reserved.
[10]	ACERRIF Auto Convention Error Interrupt Status Flag This field indicates auto convention sequence error. 0 = Received TS at ATR state is 0x3B or 0x3F. 1 = Received TS at ATR state is neither 0x3B nor 0x3F. Note: This bit can be cleared by writing 1 to it.
[9]	RXTOIF Receive Buffer Time-out Interrupt Status Flag (Read Only) This field is used for indicate receive buffer time-out interrupt status flag. 0 = Receive buffer time-out interrupt did not occur. 1 = Receive buffer time-out interrupt occurred. Note: This bit is read only, user must read all receive buffer remaining data by reading SCn_DAT register to clear it.
[8]	INITIF Initial End Interrupt Status Flag This field is used for activation (ACTEN (SCn_ALTCTL[3])), deactivation (DACTEN (SCn_ALTCTL[2])) and warm reset (WARSTEN (SCn_ALTCTL[4])) sequence interrupt status flag. 0 = Initial sequence is not complete. 1 = Initial sequence is completed. Note: This bit can be cleared by writing 1 to it.
[7]	CDIF Card Detect Interrupt Status Flag (Read Only) This field is used for card detect interrupt status flag. The card detect status is CINSERT (SCn_STATUS[12]) and CREMOVE (SCn_STATUS[11]). 0 = Card detect event did not occur. 1 = Card detect event occurred. Note: This bit is read only, user must to clear CINSERT or CREMOVE status to clear it.
[6]	BGTIF Block Guard Time Interrupt Status Flag This field is used for indicate block guard time interrupt status flag in receive direction. 0 = Block guard time interrupt did not occur.

		<p>1 = Block guard time interrupt occurred.</p> <p>Note 1: This bit is valid only when RXBGTEN (SCn_ALTCTL[12]) is enabled.</p> <p>Note 2: This bit can be cleared by writing 1 to it.</p>
[5]	TMR2IF	<p>Timer2 Interrupt Status Flag</p> <p>This field is used for Timer2 interrupt status flag.</p> <p>0 = Timer2 interrupt did not occur.</p> <p>1 = Timer2 interrupt occurred.</p> <p>Note: This bit can be cleared by writing 1 to it.</p>
[4]	TMR1IF	<p>Timer1 Interrupt Status Flag</p> <p>This field is used for Timer1 interrupt status flag.</p> <p>0 = Timer1 interrupt did not occur.</p> <p>1 = Timer1 interrupt occurred.</p> <p>Note: This bit can be cleared by writing 1 to it.</p>
[3]	TMR0IF	<p>Timer0 Interrupt Status Flag</p> <p>This field is used for Timer0 interrupt status flag.</p> <p>0 = Timer0 interrupt did not occur.</p> <p>1 = Timer0 interrupt occurred.</p> <p>Note: This bit can be cleared by writing 1 to it.</p>
[2]	TERRIF	<p>Transfer Error Interrupt Status Flag</p> <p>This field is used for transfer error interrupt status flag. The transfer error states is at SCn_STATUS register which includes receiver break error BEF (SCn_STATUS[6]), frame error FEF (SCn_STATUS[5], parity error PEF (SCn_STATUS[4] and receive buffer overflow error RXOV (SCn_STATUS[0]), transmit buffer overflow error TXOV (SCn_STATUS[8]), receiver retry over limit error RXOVERR (SCn_STATUS[22] or transmitter retry over limit error TXOVERR (SCn_STATUS[30]).</p> <p>0 = Transfer error interrupt did not occur.</p> <p>1 = Transfer error interrupt occurred.</p> <p>Note 1: This field is the status flag of BEF, FEF, PEF, RXOV, TXOV, RXOVERR or TXOVERR.</p> <p>Note 2: This bit can be cleared by writing 1 to it.</p>
[1]	TBEIF	<p>Transmit Buffer Empty Interrupt Status Flag (Read Only)</p> <p>This field is used for transmit buffer empty interrupt status flag.</p> <p>0 = Transmit buffer is not empty.</p> <p>1 = Transmit buffer is empty.</p> <p>Note: This bit is read only. If user wants to clear this bit, user must write data to DAT (SCn_DAT[7:0]) and then this bit will be cleared automatically.</p>
[0]	RDAIF	<p>Receive Data Reach Interrupt Status Flag (Read Only)</p> <p>This field is used for received data reaching trigger level RXTRGLV (SCn_CTL[7:6]) interrupt status flag.</p> <p>0 = Number of receive buffer is less than RXTRGLV setting.</p> <p>1 = Number of receive buffer data equals the RXTRGLV setting.</p> <p>Note: This bit is read only. If user reads data from SCn_DAT and receiver buffer data byte number is less than RXTRGLV, this bit will be cleared automatically.</p>

Bits	Description	
[31]	TXACT	<p>Transmit in Active Status Flag (Read Only) This bit indicates Tx transmit status. 0 = This bit is cleared automatically when Tx transfer is finished or the last byte transmission has completed. 1 = Transmit is active and this bit is set by hardware when Tx transfer is in active and the STOP bit of the last byte has not been transmitted.</p>
[30]	TXOVERR	<p>Transmitter over Retry Error This bit is used for transmitter retry counts over than retry number limitation. 0 = Transmitter retries counts is less than TXRTY (SCn_CTL[22:20]) + 1. 1 = Transmitter retries counts is equal or over to TXRTY (SCn_CTL[22:20]) + 1. Note: This bit can be cleared by writing 1 to it.</p>
[29]	TXRERR	<p>Transmitter Retry Error This bit is used for indicate transmitter error retry and set by hardware.. 0 = No Tx retry transfer. 1 = Tx has any error and retries transfer. Note 1: This bit can be cleared by writing 1 to it. Note 2: This bit is a flag and cannot generate any interrupt to CPU.</p>
[28:27]	Reserved	Reserved.
[26:24]	TXPOINT	<p>Transmit Buffer Pointer Status (Read Only) This field indicates the Tx buffer pointer status. When CPU writes data into SCn_DAT, TXPOINT increases one. When one byte of Tx buffer is transferred to transmitter shift register, TXPOINT decreases one.</p>
[23]	RXACT	<p>Receiver in Active Status Flag (Read Only) This bit indicates Rx transfer status. 0 = This bit is cleared automatically when Rx transfer is finished. 1 = This bit is set by hardware when Rx transfer is in active.</p>
[22]	RXOVERR	<p>Receiver over Retry Error</p>

		<p>This bit is used for receiver retry counts over than retry number limitation.</p> <p>0 = Receiver retries counts is less than RXRTY (SCn_CTL[18:16]) + 1.</p> <p>1 = Receiver retries counts is equal or over than RXRTY (SCn_CTL[18:16]) + 1.</p> <p>Note 1: This bit can be cleared by writing 1 to it.</p> <p>Note 2: If CPU enables receiver retries function by setting RXRTYEN (SCn_CTL[19]), hardware will not set this flag.</p>
[21]	RXRERR	<p>Receiver Retry Error</p> <p>This bit is used for receiver error retry and set by hardware.</p> <p>0 = No Rx retry transfer.</p> <p>1 = Rx has any error and retries transfer.</p> <p>Note 1: This bit can be cleared by writing 1 to it.</p> <p>Note2 This bit is a flag and cannot generate any interrupt to CPU.</p> <p>Note 3: If CPU enables receiver retries function by setting RXRTYEN (SCn_CTL[19]), hardware will not set this flag.</p>
[20:19]	Reserved	Reserved.
[18:16]	RXPOINT	<p>Receive Buffer Pointer Status (Read Only)</p> <p>This field indicates the Rx buffer pointer status. When SC controller receives one byte from external device, RXPOINT increases one. When one byte of Rx buffer is read by CPU, RXPOINT decreases one.</p>
[15:14]	Reserved	Reserved.
[13]	CDPINSTS	<p>Card Detect Pin Status (Read Only)</p> <p>This bit is the pin status of SCn_CD.</p> <p>0 = The SCn_CD pin state at low.</p> <p>1 = The SCn_CD pin state at high.</p>
[12]	CINSERT	<p>Card Insert Status of SCn_CD Pin</p> <p>This bit is set whenever card has been inserted.</p> <p>0 = No effect.</p> <p>1 = Card insert.</p> <p>Note 1: This bit can be cleared by writing "1" to it.</p> <p>Note 2: The card detect function will start after SCEN (SCn_CTL[0]) set.</p>
[11]	CREMOVE	<p>Card Removal Status of SCn_CD Pin</p> <p>This bit is set whenever card has been removal.</p> <p>0 = No effect.</p> <p>1 = Card removed.</p> <p>Note 1: This bit can be cleared by writing "1" to it.</p> <p>Note 2: Card detect function will start after SCEN (SCn_CTL[0]) set.</p>
[10]	TXFULL	<p>Transmit Buffer Full Status Flag (Read Only)</p> <p>This bit indicates Tx buffer full or not.</p> <p>0 = Tx buffer count is less than 4.</p> <p>1 = Tx buffer count equals to 4.</p>
[9]	TXEMPTY	<p>Transmit Buffer Empty Status Flag (Read Only)</p> <p>This bit indicates TX buffer empty or not.</p> <p>0 = Tx buffer is not empty.</p> <p>1 = Tx buffer is empty, it means the last byte of Tx buffer has been transferred to Transmitter Shift Register.</p> <p>Note: This bit will be cleared when writing data into DAT (SCn_DAT[7:0]).</p>
[8]	TXOV	Transmit Overflow Error Interrupt Status Flag

		<p>This bit is set when Tx buffer overflow.</p> <p>0 = Tx buffer is not overflow.</p> <p>1 = Tx buffer is overflow when Tx buffer is full and an additional write operation to DAT (SCn_DAT[7:0]).</p> <p>Note: This bit can be cleared by writing 1 to it.</p>
[7]	Reserved	Reserved.
[6]	BEF	<p>Receiver Break Error Status Flag</p> <p>This bit is set to logic 1 whenever the received data input (Rx) held in the "spacing state" (logic 0) is longer than a full word transmission time (that is, the total time of "start bit" + "data bits" + "parity bit" + "stop bits").</p> <p>0 = Receiver break error flag did not occur.</p> <p>1 = Receiver break error flag occurred.</p> <p>Note 1: This bit can be cleared by writing 1 to it.</p> <p>Note 2: If CPU sets receiver retries function by setting RXRTYEN (SCn_CTL[19]), hardware will not set this flag.</p>
[5]	FEF	<p>Receiver Frame Error Status Flag</p> <p>This bit is set to logic 1 whenever the received character does not have a valid "stop bit" (that is, the stop bit following the last data bit or parity bit is detected as logic 0).</p> <p>0 = Receiver frame error flag did not occur.</p> <p>1 = Receiver frame error flag occurred.</p> <p>Note 1: This bit can be cleared by writing 1 to it.</p> <p>Note 2: If CPU sets receiver retries function by setting RXRTYEN (SCn_CTL[19]), hardware will not set this flag.</p>
[4]	PEF	<p>Receiver Parity Error Status Flag</p> <p>This bit is set to logic 1 whenever the received character does not have a valid "parity bit".</p> <p>0 = Receiver parity error flag did not occur.</p> <p>1 = Receiver parity error flag occurred.</p> <p>Note 1: This bit can be cleared by writing 1 to it.</p> <p>Note 2: If CPU sets receiver retries function by setting RXRTYEN (SCn_CTL[19]), hardware will not set this flag.</p>
[3]	Reserved	Reserved.
[2]	RXFULL	<p>Receive Buffer Full Status Flag (Read Only)</p> <p>This bit indicates Rx buffer full or not.</p> <p>0 = Rx buffer count is less than 4.</p> <p>1 = Rx buffer count equals to 4.</p>
[1]	RXEMPTY	<p>Receive Buffer Empty Status Flag (Read Only)</p> <p>This bit indicates Rx buffer empty or not.</p> <p>0 = Rx buffer is not empty.</p> <p>1 = Rx buffer is empty, it means the last byte of Rx buffer has read from DAT (SCn_DAT[7:0]) by CPU.</p>
[0]	RXOV	<p>Receive Overflow Error Status Flag</p> <p>This bit is set when Rx buffer overflow.</p> <p>0 = Rx buffer is not overflow.</p> <p>1 = Rx buffer is overflow when the number of received bytes is greater than Rx buffer size (4 bytes).</p> <p>Note: This bit can be cleared by writing 1 to it.</p>

SC Pin Control State Register (SC_PINCTL)

Register	Offset	R/W	Description	Reset Value
SC_PINCTL	SCn_BA+0x24	R/W	SC Pin Control State Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved	SYNC	Reserved					
23	22	21	20	19	18	17	16
Reserved					RSTSTS	PWRSTS	DATASTS

Reserved				PWRINV	Reserved	SCDATA	Reserved
7	6	5	4	3	2	1	0
Reserved	CLKKEEP	Reserved				RSTEN	PWREN

Bits	Description
[31]	Reserved Reserved.
[30]	SYNC SYNC Flag Indicator (Read Only) Due to synchronization, user should check this bit when writing a new value to SCn_PINCTL register. 0 = Synchronizing is completion, user can write new data to SCn_PINCTL register. 1 = Last value is synchronizing.
[29:19]	Reserved Reserved.
[18]	RSTSTS SCn_RST Pin Status (Read Only) This bit is the pin status of SCn_RST. 0 = SCn_RST pin is low. 1 = SCn_RST pin is high.
[17]	PWRSTS SCn_PWR Pin Status (Read Only) This bit is the pin status of SCn_PWR. 0 = SCn_PWR pin to low. 1 = SCn_PWR pin to high.
[16]	DATASTS SCn_DATA Pin Status (Read Only) This bit is the pin status of SCn_DATA. 0 = The SCn_DATA pin status is low. 1 = The SCn_DATA pin status is high.
[15:12]	Reserved Reserved.
[11]	PWRINV SCn_PWR Pin Inverse This bit is used for inverse the SCn_PWR pin. There are four kinds of combination for SCn_PWR pin setting by PWRINV (SCn_PINCTL[11]) and PWREN (SCn_PINCTL[0]). PWRINV (SCn_PINCTL[11]) is bit 1 and PWREN (SCn_PINCTL[0]) is bit 0 and all conditions as below list,

		<p>00 = SCn_PWR pin is 0. 01 = SCn_PWR pin is 1. 10 = SCn_PWR pin is 1. 11 = SCn_PWR pin is 0.</p> <p>Note: User must select PWRINV (SCn_PINCTL[11]) before smart card is enabled by SCEN (SCn_CTL[0]).</p>
[10]	Reserved	Reserved.
[9]	SCDATA	<p>SCn_DATA Pin Signal</p> <p>This bit is the signal status of SCn_DATA but user can drive SCn_DATA pin to high or low by setting this bit.</p> <p>0 = Drive SCn_DATA pin to low. 1 = Drive SCn_DATA pin to high.</p> <p>Read this field to get SCn_DATA signal status.</p> <p>0 = SCn_DATA signal status is low. 1 = SCn_DATA signal status is high.</p> <p>Note: When SC is at activation, warm reset or deactivation mode, this bit will be changed automatically. Thus, do not fill in this field when SC is in these modes.</p>
[8:7]	Reserved	Reserved.
[6]	CLKKEEP	<p>SC Clock Enable Bit</p> <p>0 = SC clock generation Disabled. 1 = SC clock always keeps free running.</p> <p>Note: When operating in activation, warm reset or deactivation mode, this bit will be changed automatically. Thus, do not fill in this field when operating in these modes.</p>
[5:2]	Reserved	Reserved.
[1]	RSTEN	<p>SCn_RST Pin Signal</p> <p>User can set RSTEN (SCn_PINCTL[1]) to decide SCn_RST pin is in high or low level.</p> <p>Write this field to drive SCn_RST pin.</p> <p>0 = Drive SCn_RST pin to low. 1 = Drive SCn_RST pin to high.</p> <p>Read this field to get SCn_RST signal status.</p> <p>0 = SCn_RST signal status is low. 1 = SCn_RST signal status is high.</p> <p>Note: When operating at activation, warm reset or deactivation mode, this bit will be changed automatically. Thus, do not fill in this field when operating in these modes.</p>
[0]	PWREN	<p>SCn_PWR Pin Signal</p> <p>User can set PWRINV (SCn_PINCTL[11]) and PWREN (SCn_PINCTL[0]) to decide SCn_PWR pin is in high or low level.</p> <p>Write this field to drive SCn_PWR pin</p> <p>Refer PWRINV (SCn_PINCTL[11]) description for programming SCn_PWR pin voltage level.</p> <p>Read this field to get SCn_PWR signal status.</p> <p>0 = SCn_PWR signal status is low. 1 = SCn_PWR signal status is high.</p> <p>Note: When operating at activation, warm reset or deactivation mode, this bit will be changed automatically. Thus, do not fill in this field when operating in these modes.</p>

Reserved				T1EXT			

Bits	Description	
[31:5]	Reserved	Reserved.
[4:0]	T1EXT	<p>T1 Extend Time of Hardware Activation This field provide the configurable cycles to extend the activation time T1 period. The cycle scaling factor is 2048. Extend cycles = (filled value * 2048) cycles. Refer to SC activation sequence in Figure 6.14-4. For example, SCLK = 4 MHz, each cycle = 0.25us., Filled 20 to this field Extend time = 20 * 2048 * 0.25us = 10.24 ms. Note: Setting 0 to this field conforms to the protocol ISO/IEC 7816-3.</p>

6.15 Serial Peripheral Interface (SPI)

6.15.1 Overview

The Serial Peripheral Interface (SPI) applies to synchronous serial data communication and allows full duplex transfer. Devices communicate in Master/Slave mode with the 4-wire bi-direction interface. The chip contains one of SPI controller performing a serial-to-parallel conversion on data received from a peripheral device, and a parallel-to-serial conversion on data transmitted to a peripheral device. Each SPI controller can be configured as a master or a slave device and supports the PDMA function to access the data buffer. Each SPI controller also supports I²S mode to connect external audio CODEC. Please refer to the M251 Datasheet for detailed information about maximum SPI clock frequency of SPI master mode and SPI slave mode and range of SPI operation voltage.

6.15.2 Features

- SPI Mode
 - Support one SPI controller
 - Supports Master or Slave mode operation
 - Configurable bit length of a transaction word from 8 to 32-bit
 - Provides separate 4-level depth transmit and receive FIFO buffers
 - Supports MSB first or LSB first transfer sequence
 - Supports Byte Reorder function
 - Supports Byte or Word Suspend mode
 - Supports PDMA transfer
 - Supports one data channel half-duplex transfer
 - Supports receive-only mode
- I²S Mode
 - Supports Master or Slave
 - Capable of handling 8-, 16-, 24- and 32-bit word sizes
 - Each provides two 4-level FIFO data buffers, one for transmitting and the other for receiving
 - Supports monaural and stereo audio data
 - Supports PCM mode A, PCM mode B, I²S and MSB justified data format
 - Supports two PDMA requests, one for transmitting and the other for receiving

6.15.3 Block Diagram

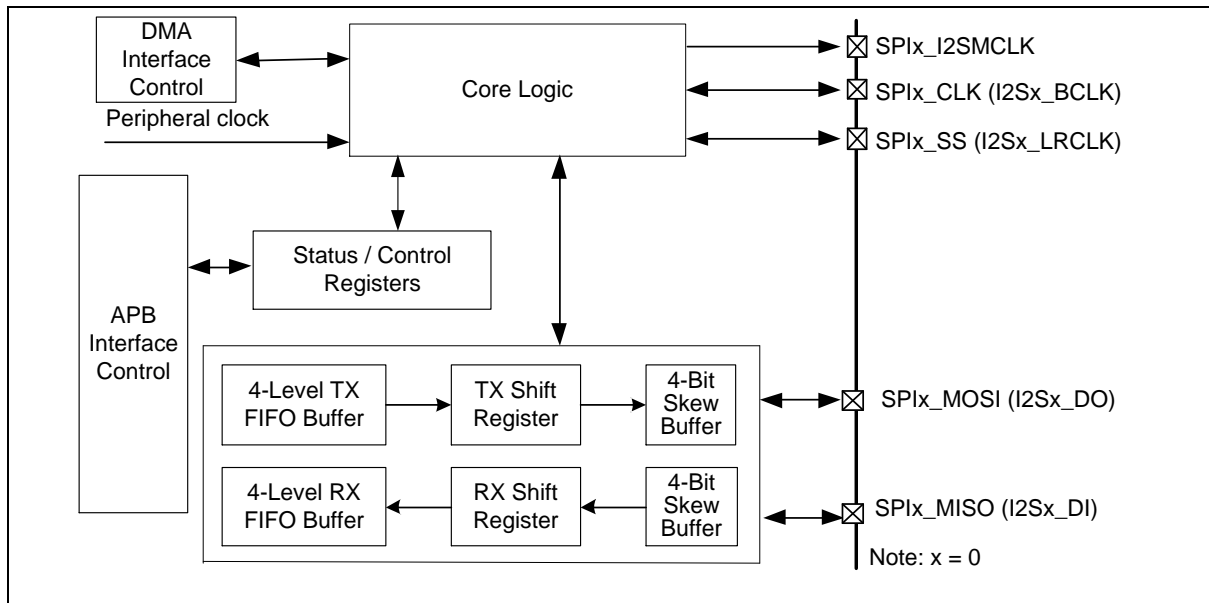

Figure 6.15-1 SPI Block Diagram

TX FIFO Buffer:

The transmit FIFO buffer is a 4-level depth, 32-bit wide, first-in, first-out register buffer. The data can be written to the transmit FIFO buffer in advance through software by writing the SPIx_TX register. In SPI mode, the transmit FIFO will be configured as 8-level while data length is set as 8~16 bits.

RX FIFO Buffer:

The receive FIFO buffer is also a 4-level depth, 32-bit wide, first-in, first-out register buffer. The receive control logic will store the receive data to this buffer. The FIFO buffer data can be read from SPIx_RX register by software. In SPI mode, the receive FIFO will be configured as 8-level while data length is set as 8~16 bits.

TX Shift Register:

The transmit shift register is a 32-bit wide register buffer. The transmit data is loaded from the TX FIFO buffer and shifted out bit-by-bit to the skew buffer.

RX Shift Register:

The receive shift register is also a 32-bit wide register buffer. The receive data is shift in bit-by-bit from the skew buffer and is loaded into RX FIFO buffer when a transaction done.

Skew Buffer:

The skew buffer is a 4-level 1-bit buffer. There are two skew buffers in transmitting and received side. In received side, it is used to shift bits into RX shift register from SPI bus. In transmitting side, it is used to shift bits into SPI bus from TX shift register.

6.15.4 Basic Configuration

6.15.4.1 SPI0 Basic Configuration

- Clock source Configuration
 - Select the source of SPI0 peripheral clock on SPI0SEL (CLK_CLKSEL2[5:4]).
 - Enable SPI0 peripheral clock in SPI0CKEN (CLK_APBCLK0[13]).
- Reset Configuration

- Reset SPI0 controller in SPI0RST (SYS_IPRST1[13]).

- Pin Configuration

Group	Pin Name	GPIO	MFP
SPI0	SPI0_CLK	PA.2, PB.14, PD.2	MFP4
	SPI0_I2SMCLK	PA.4, PC.14, PD.13	MFP4
		PB.0	MFP8
		PB.11	MFP9
	SPI0_MISO	PA.1, PB.13, PD.1	MFP4
		PF.7	MFP5
	SPI0_MOSI	PA.0, PB.12, PD.0	MFP4
		PF.6	MFP5
SPI0_SS	PA.3, PB.15, PD.3	MFP4	

SPI/I²S (SPI0) Interface Controller Pin description is shown as follows:

Pin	SPI Mode	I ² S Mode
SPIx_SS	SPI slave selection pin	I ² S left/right channel synchronization clock pin (I2Sx_LRCLK)
SPIx_CLK	SPI clock pin	I ² S bit clock pin (I2Sx_BCLK)
SPIx_MISO	SPI master input or slave output pin	I ² S data input pin (I2Sx_DI)
SPIx_MOSI	SPI master output or slave input pin	I ² S data output pin (I2Sx_DO)
SPIx_I2SMCLK	Not available	I ² S Master clock output pin

Table 6.15-1 SPI/I²S Interface Controller Pin Description (SPI0)

6.15.5 Functional Description

6.15.5.1 Terminology

SPI Peripheral Clock and SPI Bus Clock

The SPI controller needs the peripheral clock to drive the SPI logic unit to perform the data transfer. The peripheral clock rate is determined by the settings of clock divisor (SPIx_CLKDIV) and the clock source which can be HXT, PLL, PCLK or HIRC. SPIxSEL of CLK_CLKSEL2 register determines the clock source of the peripheral clock. The DIVIDER (SPIx_CLKDIV[8:0]) setting determines the divisor of the clock rate calculation.

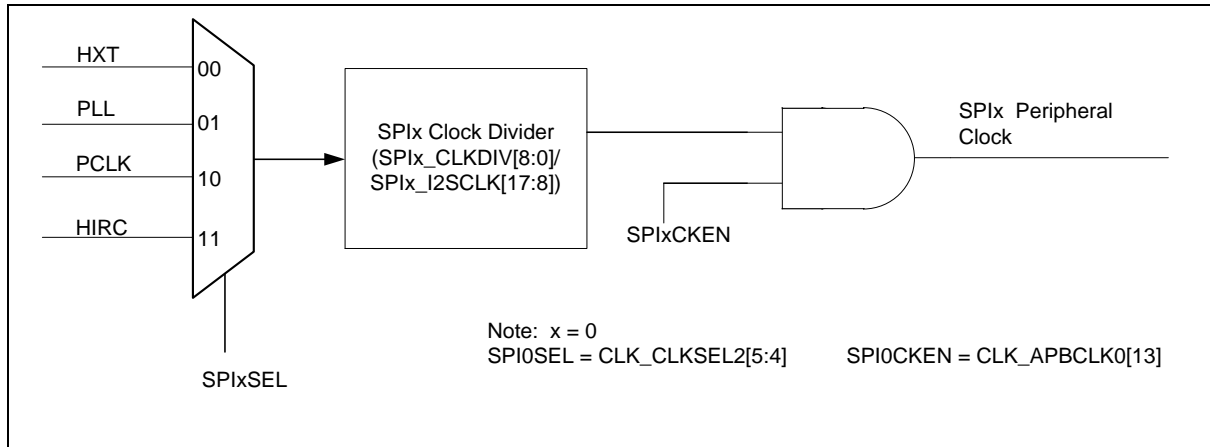

Figure 6.15-2 SPI Peripheral Clock

In Master mode, the frequency of the SPI bus clock is equal to the peripheral clock rate. In general, the SPI bus clock is denoted as SPI clock. In Slave mode, the SPI bus clock is provided by a master device. The frequency of SPI peripheral clock cannot be faster than the system clock rate regardless of Master or Slave mode.

In I²S mode, the peripheral clock rate is equal to I²S bit clock rate determined by SPIx_I2SCLK register.

Master/Slave mode

The SPI controllers can be set as Master or Slave mode by setting the SLAVE (SPIx_CTL[18]) to communicate with the off-chip SPI slave or master device. The HALFDPX (SPIx_CTL[14]) can be used to select the full-duplex or half-duplex in SPI transmission. The application block diagrams in Master and Slave mode are shown below.

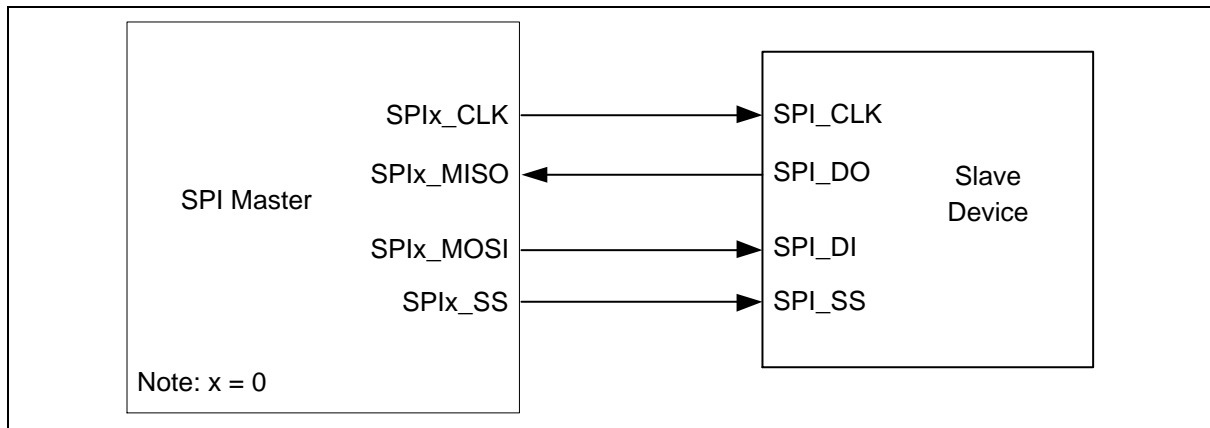

Figure 6.15-3 SPI Full-Duplex Master Mode Application Block Diagram

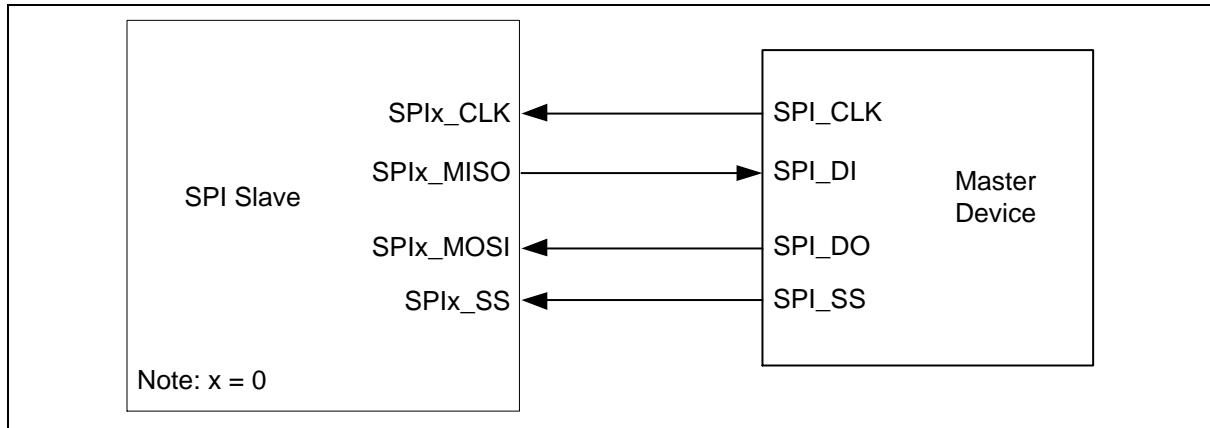

Figure 6.15-4 SPI Full-Duplex Slave Mode Application Block Diagram

Slave Selection

In Master mode, the SPI controller can drive off-chip slave device through the slave select output pin SPIx_SS. In Slave mode, the off-chip master device drives the slave selection signal from the SPIx_SS input port to this SPI controller. The duration between the slave select active edge and the first SPI clock input shall over 3 SPI peripheral clock cycles of slave.

In Master/Slave mode, the active state of slave selection signal can be programmed to low or high active in SSACTPOL (SPIx_SSCTL[2]). The selection of slave select conditions depends on what type of device is connected. In Slave mode, to recognize the inactive state of the slave selection signal, the inactive period of the slave selection signal must be larger than or equal to 3 peripheral clock cycles between two successive transactions.

Timing Condition

The CLKPOL (SPIx_CTL[3]) defines the SPI clock idle state. If CLKPOL = 1, the output SPI clock is idle at high state; if CLKPOL = 0, it is idle at low state.

TXNEG (SPIx_CTL[2]) defines the data transmitted out either on negative edge or on positive edge of SPI clock. RXNEG (SPIx_CTL[1]) defines the data received either on negative edge or on positive edge of SPI clock.

Note: The settings of TXNEG and RXNEG are mutual exclusive. In other words, do not transmit and receive data at the same clock edge.

Transmit/Receive Bit Length

The bit length of a transaction word is defined in DWIDTH (SPIx_CTL[12:8]) and can be configured up to 32-bit length in a transaction word for transmitting and receiving.

When SPI controller finishes a transaction, i.e. receives or transmits a specific count of bits defined in DWIDTH (SPIx_CTL[12:8]), the unit transfer interrupt flag UNITIF (SPIx_STATUS[1]) will be set to 1.

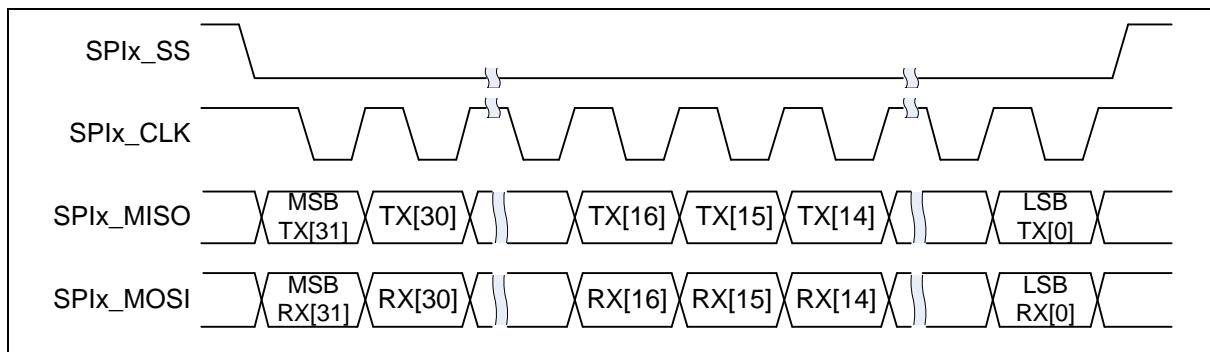

Figure 6.15-532-bit in One Transaction

LSB/MSB First

LSB (SPIx_CTL[13]) defines the bit transfer sequence in a transaction. If the LSB (SPIx_CTL[13]) is set to 1, the transfer sequence is LSB first. The bit 0 will be transferred firstly. If the LSB (SPIx_CTL[13]) is cleared to 0, the transfer sequence is MSB first.

Suspend Interval

SUSPITV (SPIx_CTL[7:4]) provides a configurable suspend interval, 0.5 ~ 15.5 SPI clock periods, between two successive transaction words in Master mode. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value of SUSPITV is 0x3 (3.5 SPI clock cycles).

6.15.5.2 Automatic Slave Selection

In Master mode, if AUTOSS (SPIx_SSCTL[3]) is set, the slave selection signal will be generated automatically and output to the SPIx_SS pin according to whether SS (SPIx_SSCTL[0]) is enabled or not. The slave selection signal will be set to active state by the SPI controller when the SPI data transfer is started by writing to FIFO. It will be set to inactive state when SPI bus is idle. If SPI bus is not idle, i.e. TX FIFO, TX shift register or TX skew buffer is not empty, the slave selection signal will be set to inactive state between transactions if the value of SUSPITV (SPIx_CTL[7:4]) is greater than or equal to 3.

In Master mode, if the value of SUSPITV is less than 3 and the AUTOSS is set as 1, the slave selection signal will be kept at active state between two successive transactions.

If the AUTOSS bit is cleared, the slave selection output signal will be determined by the SS setting. The active state of the slave selection output signal is specified in SSACTPOL (SPIx_SSCTL[2]).

The duration between the slave selection signal active edge and the first SPI bus clock edge is 1 SPI bus clock cycle and the duration between the last SPI bus clock and the slave selection signal inactive edge is 1.5 SPI bus clock cycle.

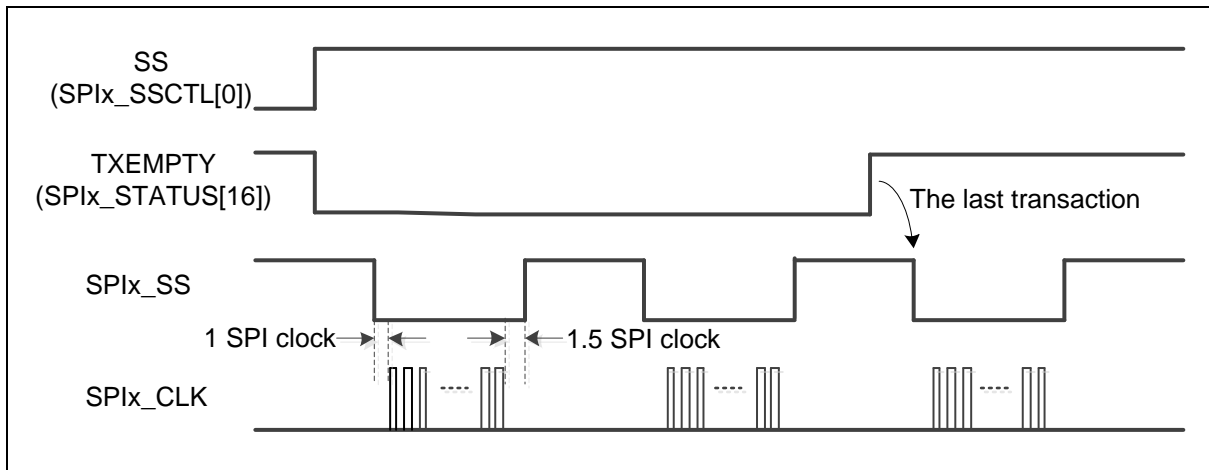

Figure 6.15-6 Automatic Slave Selection (SSACTPOL = 0, SUSPITV > 0x2)

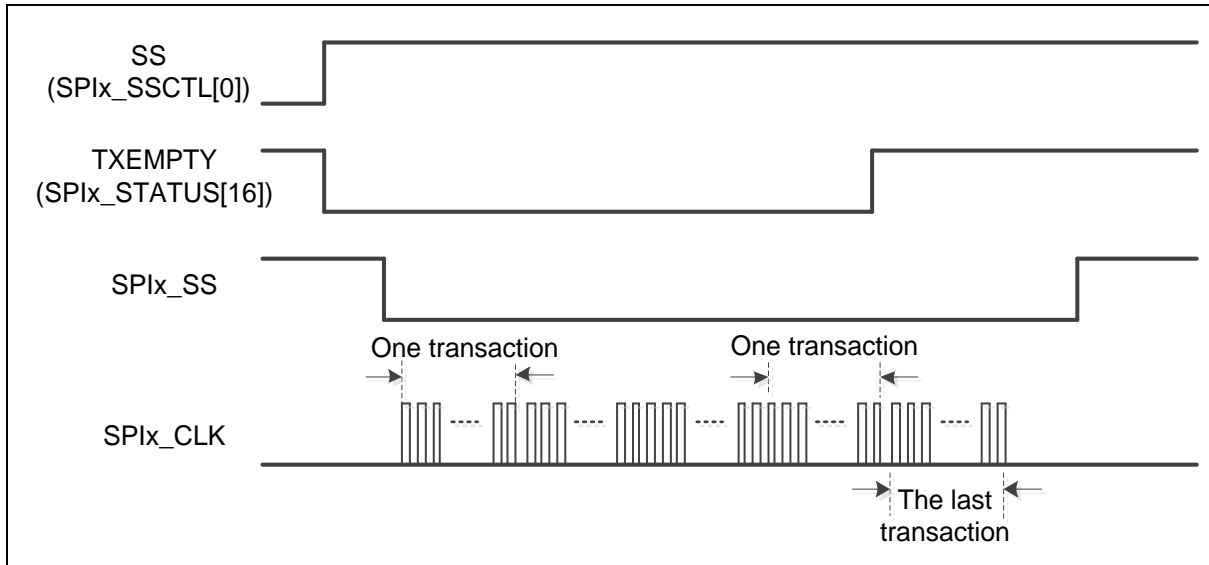

Figure 6.15-7 Automatic Slave Selection (SSACTPOL = 0, SUSPITV < 0x3)

6.15.5.3 Byte Reorder and Suspend Function

When the transfer is set as MSB first (LSB = 0) and the REORDER (SPIx_CTL[19]) is set to 1, the data stored in the TX buffer and RX buffer will be rearranged in the order as [Byte0, Byte1, Byte2, Byte3] in 32-bit transfer (DWIDTH = 0). The sequence of transmitted/received data will be Byte0, Byte1, Byte2, and then Byte3. If the DWIDTH is set as 24-bit transfer mode, the data in TX buffer and RX buffer will be rearranged as [unknown byte, Byte0, Byte1, Byte2]. The SPI controller will transmit/receive data with the sequence of Byte0, Byte1 and then Byte2. Each byte will be transmitted/received with MSB first. The rule of 16-bit mode is the same as above. Byte Reorder function is only available when DWIDTH is configured as 16, 24, and 32 bits.

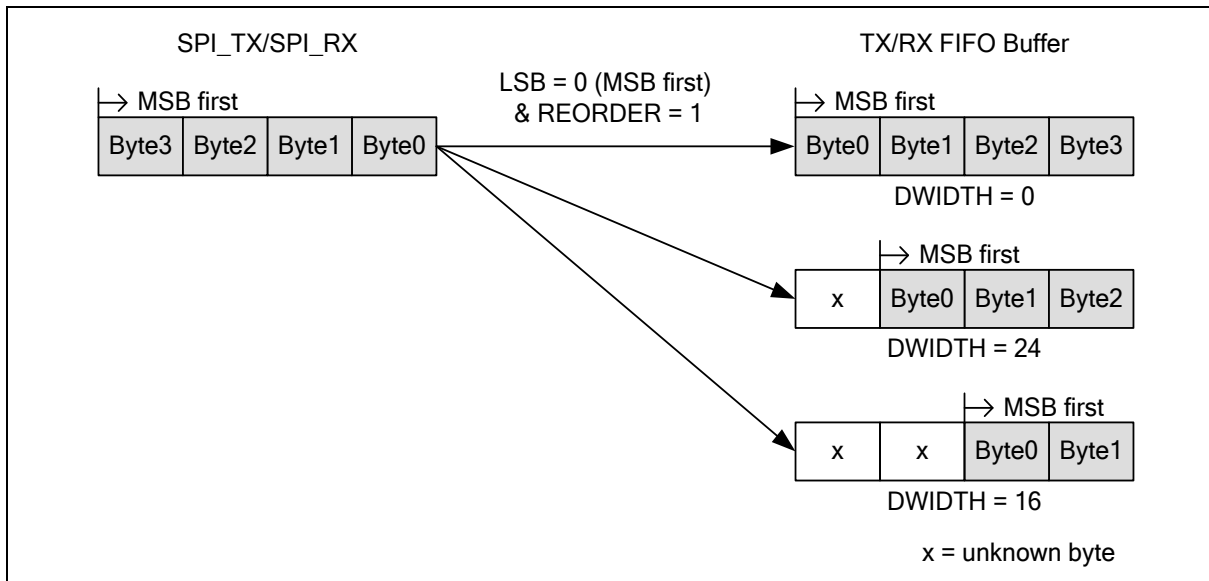

Figure 6.15-8 Byte Reorder Function

In Master mode, if REORDER (SPIx_CTL[19]) is set to 1, a suspend interval of 0.5 ~ 15.5 SPI clock periods will be inserted by hardware between two successive bytes in a transaction word. The suspend interval is configured in SUSPITV (SPIx_CTL[7:4]).

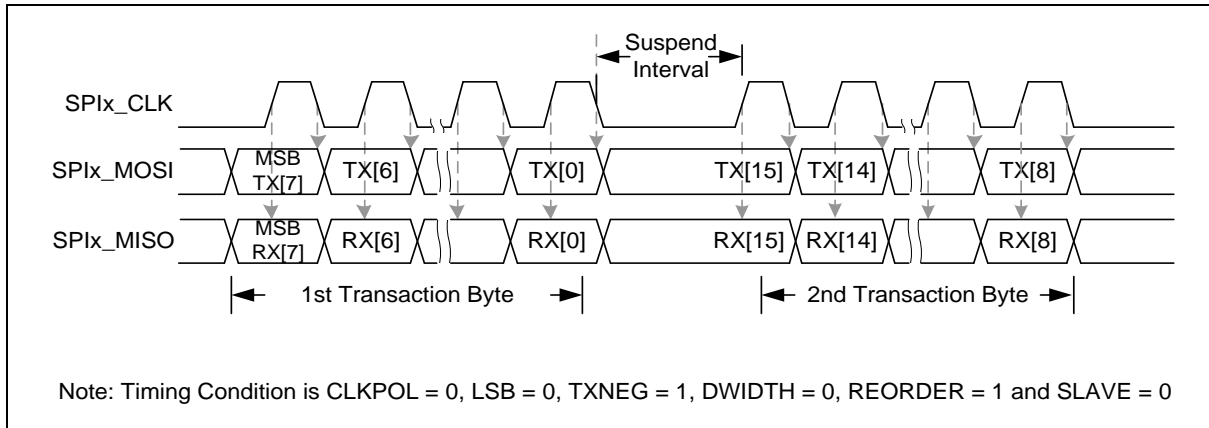

Figure 6.15-9 Timing Waveform for Byte Suspend

6.15.5.4 Half-Duplex Communication

The SPI controller can communicate in half-duplex mode by setting HALFDPX (SPIx_CTL[14]) bit. In half-duplex mode, there is only one data line for receiving or transmitting data direction which is defined by DATDIR (SPIx_CTL[20]). In half-duplex configuration, the SPIx_MISO pin is free for other applications and it can be configured as GPIO. Enabling or disabling the control bit HALFDPX (SPIx_CTL[14]) will produce TXFBCLR (SPIx_FIFCTL[9]) and RXFBCLR (SPIx_FIFCTL[8]) at the same time automatically.

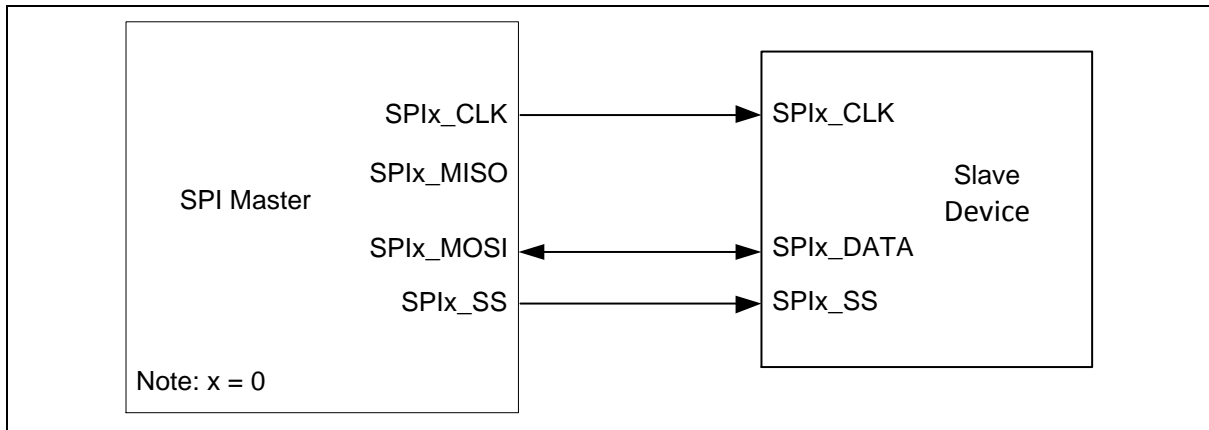

Figure 6.15-10 SPI Half-Duplex Master Mode Application Block Diagram

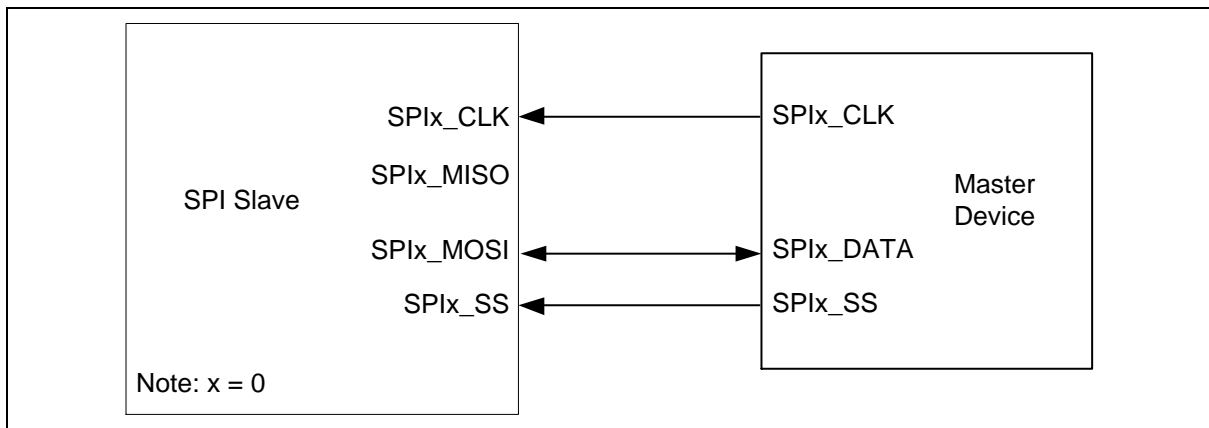

Figure 6.15-11 SPI Half-Duplex Slave Mode Application Block Diagram

6.15.5.5 Receive-Only Mode

In SPI Master device, it can communicate in receive-only mode by setting RXONLY (SPIx_CTL[15]). In this configuration, the SPI Master device will generate SPI bus clock continuously as long as the receive-only mode is enabled for receiving data bit from SPI slave device. If AUTOSS (SPIx_SSCTL[3]) is enabled in receive-only mode, SPI Master will keep activating the slave select signal.

The remaining SPIx_MOSI pin of SPI Master device is not used for communication and can be configured as GPIO. The status BUSY (SPIx_STATUS[0]) will be asserted in receive-only mode due to the generation of SPI bus clock. Entering this mode will produce the TXFBCLR (SPIx_FIFCTL[9]) and RXFBCLR (SPIx_FIFCTL[8]) at the same time automatically. When user enables this mode, the output SPI bus clock will be sent out after 6 peripheral clock cycles. In this mode, the data which has been written into transmit FIFO will be loaded into transmit shift register and sent out.

6.15.5.6 PDMA Transfer Function

SPI controller supports PDMA transfer function.

When TXPDMAEN (SPIx_PDMACTL[0]) is set to 1, the controller will issue request to PDMA controller to start the PDMA transmission process automatically.

When RXPDMAEN (SPIx_PDMACTL[1]) is set to 1, the controller will start the PDMA reception process. SPI controller will issue request to PDMA controller automatically when there is data in the RX FIFO buffer.

When PDMA transfer is done, user needs to disable TXPDMAEN/RXPDMAEN. After re-setting control registers of PDMA, user enables TXPDMAEN/RXPDMAEN again.

Note: SPI supports single request PDMA (Read/Write) only, burst request PDMA is not supported.

6.15.5.7 FIFO Buffer Operation

The SPI controllers equip with four 32-bit wide transmit and receive FIFO buffers. The data stored in the transmit FIFO buffer will be read and sent out by the transmission control logic. If the transmit FIFO buffer is full, the TXFULL (SPIx_STATUS[17]) will be set to 1. When the SPI transmission logic unit draws out the last datum of the transmit FIFO buffer, so that the transmit FIFO buffer is empty, the TXEMPTY (SPIx_STATUS[16]) will be set to 1. Note that the TXEMPTY (SPIx_STATUS[16]) flag is set to 1 while the last transaction is still in progress. In Master mode, the BUSY (SPIx_STATUS[0]) is set to 1 when the FIFO buffer is written any data or there is any transaction on the SPI bus. (e.g. the slave selection signal is active and the SPI controller is receiving data in Slave mode). It will set to 0 when the transmit FIFO is empty and the current transaction has done. Thus, the status of BUSY (SPIx_STATUS[0]) should be checked by software to make sure whether the SPI is in idle or not.

The receive control logic will store the SPI input data into the receive FIFO buffer. There are FIFO related status bits, like RXEMPTY (SPIx_STATUS[8]) and RXFULL (SPIx_STATUS[9]), to indicate the current status of RX FIFO buffer.

The transmitting and receiving threshold can be configured by setting TXTH (SPIx_FIFCTL[30:28]) and RXTH (SPIx_FIFCTL[26:24]). When the count of valid data stored in transmit FIFO buffer is less than or equal to TXTH (SPIx_FIFCTL[30:28]) setting, TXTHIF (SPIx_STATUS[18]) will be set to 1. When the count of valid data stored in receive FIFO buffer is larger than RXTH (SPIx_FIFCTL[26:24]) setting, RXTHIF (SPIx_STATUS[10]) will be set to 1.

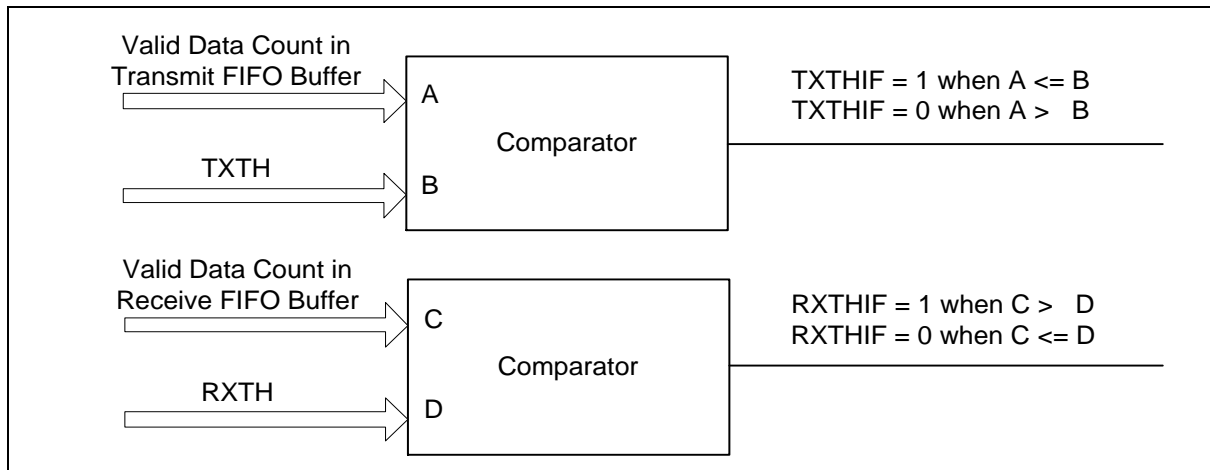

Figure 6.15-12 FIFO Threshold Comparator

In Master mode, when the first datum is written to the SPIx_TX register, the TXEMPTY flag (SPIx_STATUS[16]) will be cleared to 0. The transmission will start after 1 PCLK clock cycles and 6 peripheral clock cycles. User can write the next data into SPIx_TX register immediately. The SPI controller will insert a suspend interval between two successive transactions. The period of suspend interval is decided by the setting of SUSPITV (SPIx_CTL[7:4]). If the SUSPITV (SPIx_CTL[7:4]) equals 0, SPI controller can perform continuous transfer. User can write data into SPIx_TX register as long as the TXFULL (SPIx_STATUS[17]) is 0.

When user sets DWIDTH (SPIx_CTL[12:8]) to 8 bits ~ 16 bits, the FIFO structure will be configured to eight 16-bit wide transmit and receive FIFO buffers automatically.

The Example 1 of Figure 6.15-13 indicates the updated condition of TXEMPTY (SPIx_STATUS[16]) and the relationship among the FIFO buffer, shift register and the skew buffer for 8~16 bits of data length. The TXEMPTY (SPIx_STATUS[16]) is set to 0 when the Data0 is written into the FIFO buffer. The Data0 will be loaded into the shift register by the core logic and the TXEMPTY (SPIx_STATUS[16]) will be to 1. The Data0 in shift register will be shift into skew buffer by bit for transmission until the transfer is done.

The Example 2 of Figure 6.15-13 indicates the updated condition of TXFULL (SPIx_STATUS[17]) when there are 8 data in the FIFO buffer and the next data of Data9 does not be written into the FIFO buffer when the TXFULL = 1.

The example 1 of Figure 6.15-13 indicates the updated condition of TXEMPTY (SPIx_STATUS[16]) and the relationship among the FIFO buffer, shift register and the skew buffer for 17~32 bits of data length.

The Example 2 of Figure 6.15-14 indicates the updated condition of TXFULL (SPIx_STATUS[17]) when there are 4 data in the FIFO buffer and the next data of Data5 is not written into the FIFO buffer when TXFULL = 1.

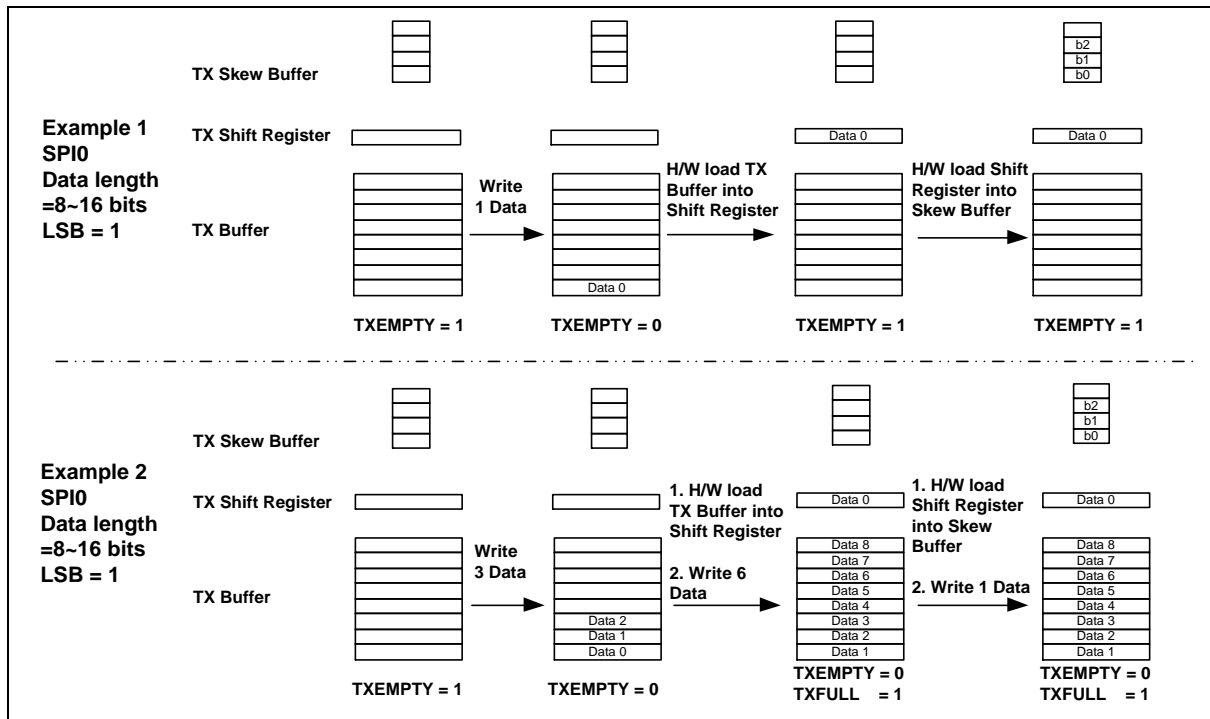

Figure 6.15-13 Transmit FIFO Buffer Example for 8~16 Bits of Data Length

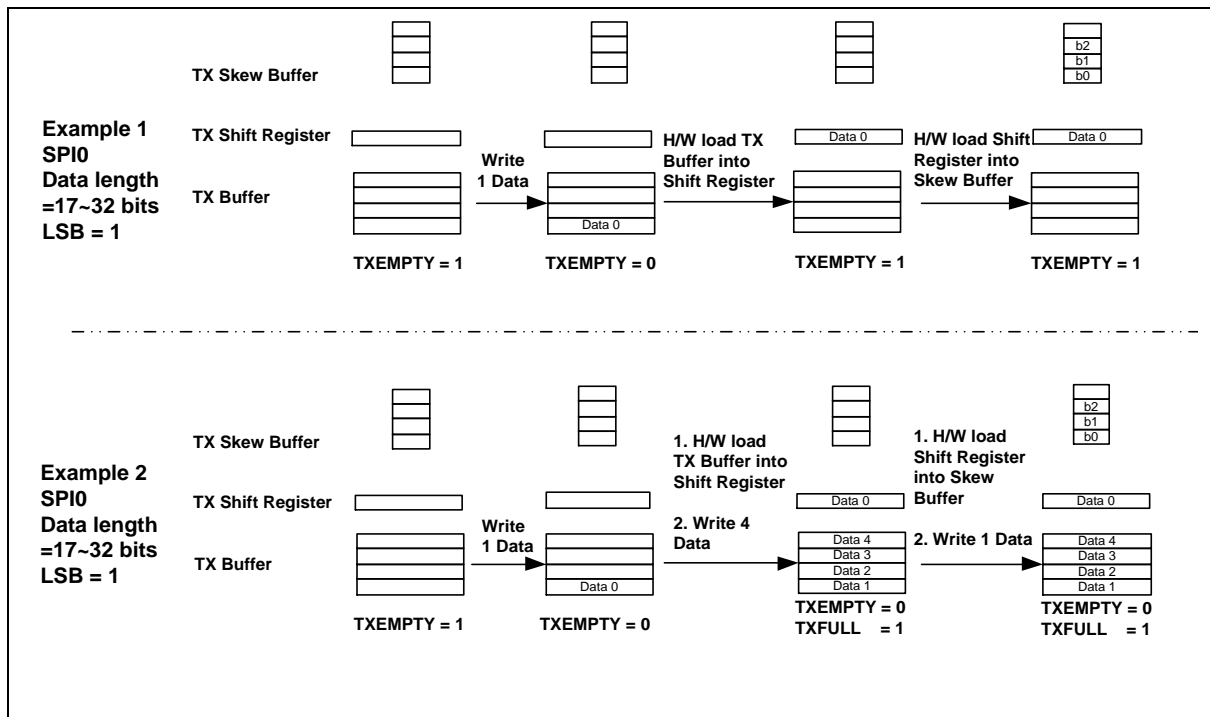

Figure 6.15-14 Transmit FIFO Buffer Example for 17~32 Bits of Data Length

The subsequent transactions will be triggered automatically if the transmitted data are updated in time. If the SPIx_TX register does not be updated after all data transfers are done, the transfer will stop.

In Master mode, during receiving operation, the serial data are received from SPIx_MISO pin and stored to receive FIFO buffer.

The received data (Data0's b0, b1, ...b31) is stored into skew buffer first according the serial clock (SPIx_CLK) and then it is shift into the shift register bit by bit. The core logic will load the data in shift register into FIFO buffer when the received data bit count reach the value of DWIDTH (SPIx_CTL[12:8]).

The RXEMPTY (SPIx_STATUS[8]) will be cleared to 0 while the receive FIFO buffer contains unread data (see the Example 1 of Receive FIFO Buffer Example in Figure 6.15-). The received data can be read by software from SPIx_RX register as long as the RXEMPTY (SPIx_STATUS[8]) is 0. If the receive FIFO buffer contains 8 unread data, the RXFULL (SPIx_STATUS[9]) will be set to 1 (see the Example 2 of Receive FIFO Buffer Example in Figure 6.15-).

The RXEMPTY (SPIx_STATUS[8]) will be cleared to 0 while the receive FIFO buffer contains unread data (see the Example 1 of Receive FIFO Buffer Example in Figure 6.15-15. The received data can be read by software from SPIx_RX register as long as the RXEMPTY (SPIx_STATUS[8]) is 0. If the receive FIFO buffer contains 4 unread data, the RXFULL (SPIx_STATUS[9]) will be set to 1 (see the Example 2 of Receive FIFO Buffer Example in Figure 6.15-16).

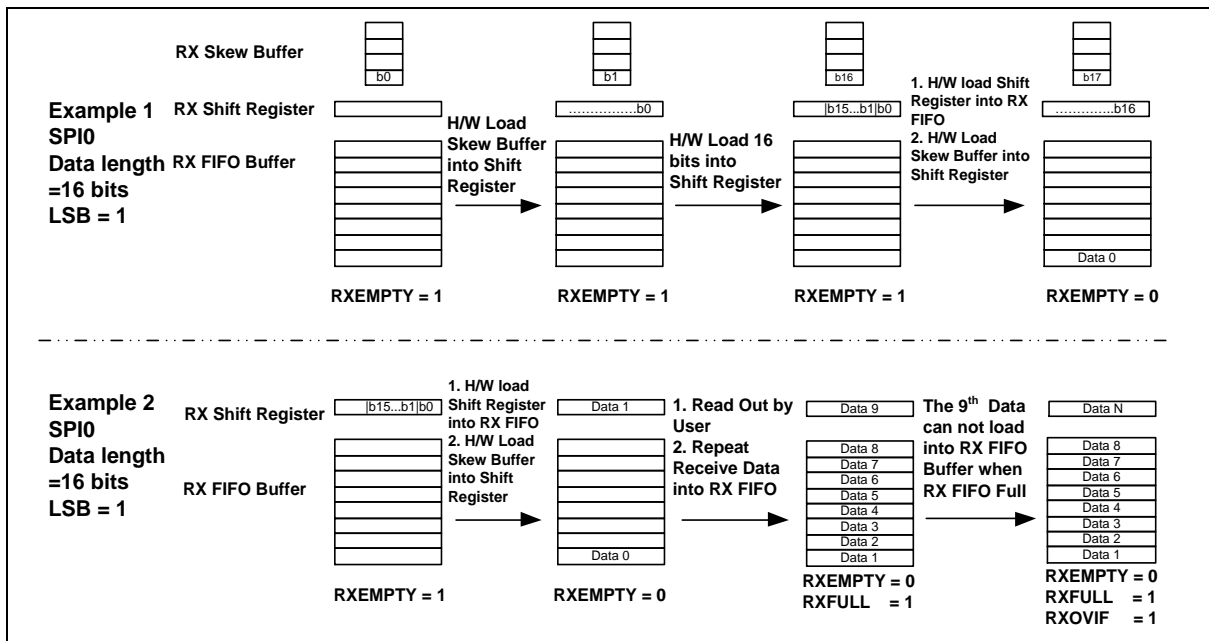

Figure 6.15-15 Receive FIFO Buffer Example for 16 Bits of Data Length

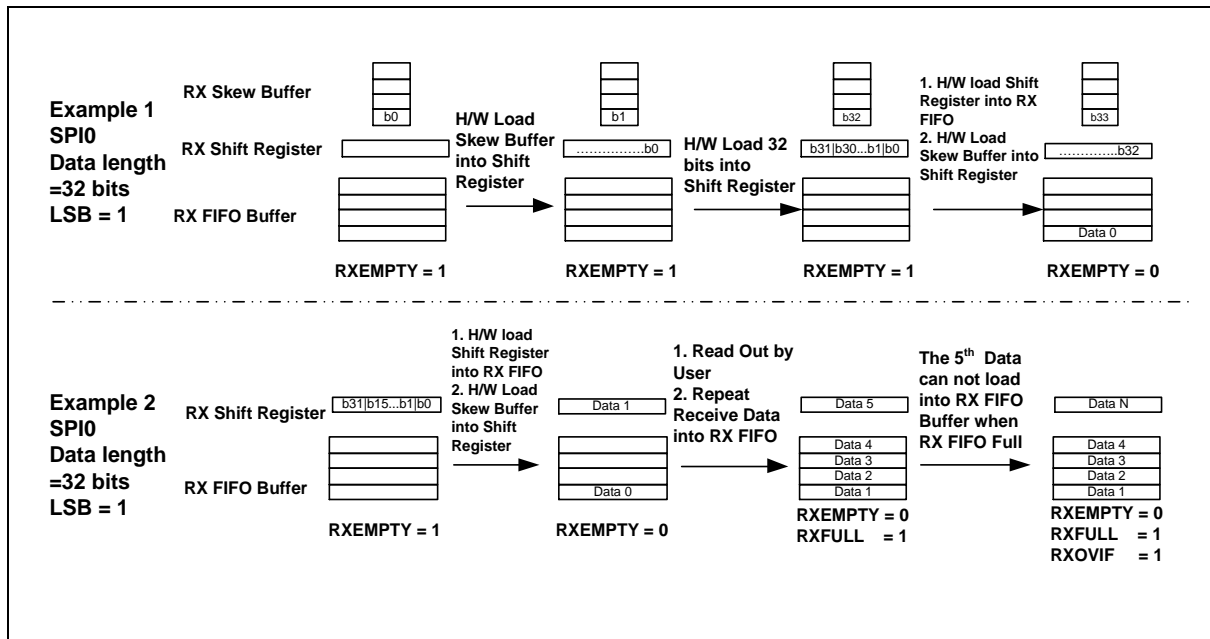

Figure 6.15-16 Receive FIFO Buffer Example for 32 Bits of Data Length

In Slave mode, during transmission operation, when data is written to the SPIx_TX register by software, the data will be loaded into transmit FIFO buffer and the TXEMPTY (SPIx_STATUS[16]) will be set to 0. The transmission will start when the slave device receives clock signal from master. Data can be written to SPIx_TX register as long as the TXFULL (SPIx_STATUS[17]) is 0. After all data have been drawn out by the SPI transmission logic unit and the SPIx_TX register is not updated by software, the TXEMPTY (SPIx_STATUS[16]) will be set to 1.

If there is no any data written to the SPIx_TX register, the transmit underflow interrupt flag, TXUFIF (SPIx_STATUS[19]) will be set to 1 when the slave selection signal is active. The output data will be held by TXUFPOL (SPIx_FIFCTL[6]) setting during this transfer until the slave selection signal goes to inactive state. When the transmit underflow event occurs, the slave under run interrupt flag, SLVURIF (SPIx_STATUS[7]), will be set to 1 as SPIx_SS goes to inactive state.

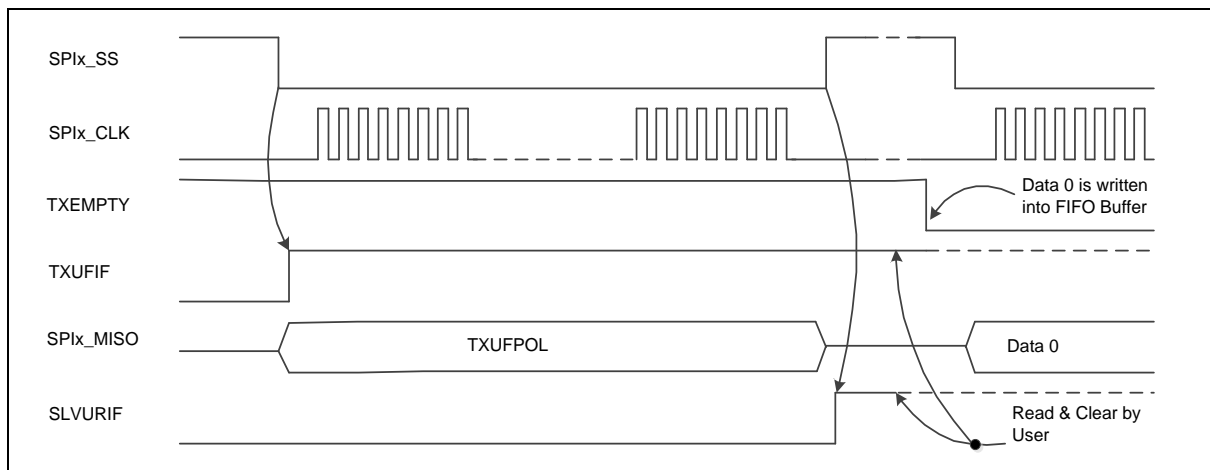

Figure 6.15-17 TX Underflow Event and Slave Under Run Event

In Slave mode, during receiving operation, the serial data is received from SPIx_MOSI pin and stored to SPIx_RX register. The reception mechanism is similar to Master mode reception operation. If the receive FIFO buffer contains 4 unread data, the RXFULL (SPIx_STATUS[9]) will be set to 1 and the

RXOVIF (SPIx_STATUS[11]) will be set to 1 if there is more serial data received from SPIx_MOSI and follow-up data will be dropped (refer to the Receive FIFO Buffer Example figure). If the receive bit count mismatch with the DWIDTH (SPIx_CTL[12:8]) when the slave selection line goes to inactive state, the SLVBEIF (SPIx_STATUS[6]) will be set to 1.

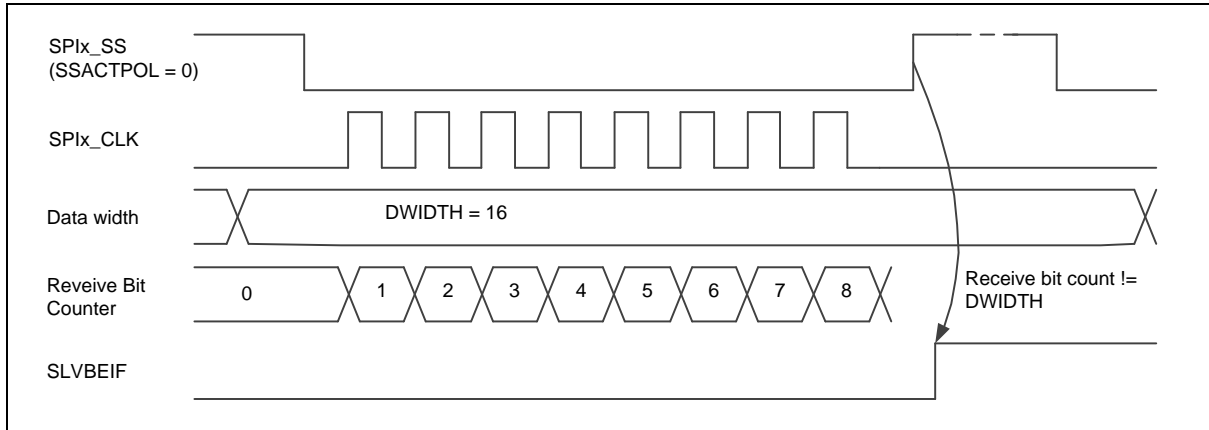

Figure 6.15-18 Slave Mode Bit Count Error

The SPI controller has the receive time-out function. When the receive FIFO is not empty and no read operation in receive FIFO over 64 SPI peripheral clock periods in Master mode or over 576 SPI peripheral clock periods in Slave mode, the receive time-out occurs and the RXTIOF (SPIx_STATUS[12]) will be set to 1. When the receive FIFO is read by user, the time-out status will be cleared automatically.

6.15.5.8 Interrupt

- SPI unit transfer interrupt

As the SPI controller finishes a unit transfer, the unit transfer interrupt flag UNITIF (SPIx_STATUS[1]) will be set to 1. The unit transfer interrupt event will generate an interrupt to CPU if the unit transfer interrupt enable bit UNITIEN (SPIx_CTL[17]) is set. The unit transfer interrupt flag can be cleared only by writing 1 to it.

- SPI slave selection active/inactive interrupt

In Slave mode, the slave selection active/inactive interrupt flag, SSACTIF (SPIx_STATUS[2]) and SSINAIF (SPIx_STATUS[3]), will be set to 1 when the SPIEN (SPIx_CTL[0]) and SLAVE (SPIx_CTL[18]) are set to 1 and the slave selection signal goes to active/inactive state. The SPI controller will issue an interrupt if the SSINAIF (SPIx_SSCTL[13]) or SSACTIEN (SPIx_SSCTL[12]), are set to 1.

- Slave bit count error interrupt

In Slave mode, if the transmit/receive bit count mismatch with the DWIDTH (SPIx_CTL[12:8]) when the slave selection line goes to inactive state, the SLVBEIF (SPIx_STATUS[6]) will be set to 1. The uncompleted transaction will be dropped from TX and RX shift registers. The SPI controller will issue an interrupt if the SLVBEIEN (SPIx_SSCTL[8]) is set to 1.

Note: If the slave selection signal is active but there is no any serial clock input, the SLVBEIF (SPIx_STATUS[6]) will be set to 1 when the slave selection signal goes to inactive state.

- TX underflow interrupt

In SPI Slave mode, if there is no any data is written to the SPIx_TX register, the TXUFIF (SPIx_STATUS[19]) will be set to 1 when the slave selection signal is active. The SPI controller will issue a TX underflow interrupt if the TXUFIEN (SPIx_FIFCTL[7]) is set to 1.

Note: If underflow event occurs in SPI Slave mode, there are two conditions which make SPI Slave mode return to idle state and then goes for next transfer: (1) set TXRST to 1 (2) slave select signal is changed to inactive state.

- Slave TX under run interrupt

If the TX underflow event occurs, the SLVURIF (SPIx_STATUS[7]) will be set to 1 when SPIx_SS goes to inactive state. The SPI controller will issue a TX under run interrupt if the SLVURIEN (SPIx_SSCTL[9]) is set to 1.

- Receive Overrun interrupt

In Slave mode, if the receive FIFO buffer contains 4 unread data for 17~32 bits of data length, the RXFULL (SPIx_STATUS[9]) will be set to 1 and the RXOVIF (SPIx_STATUS[11]) will be set to 1 if there is more serial data is received from SPI bus and the follow-up data will be dropped. The SPI controller will issue an interrupt if the RXOVIEN (SPIx_FIFCTL[5]) is set to 1.

If the receive FIFO buffer contains 8 unread data for 8~16 bits of data length, the RXFULL (SPIx_STATUS[9]) will be set to 1 and the RXOVIF (SPIx_STATUS[11]) will be set to 1 if there is more serial data received from SPI bus and the follow-up data will be dropped. The SPI controller will issue an interrupt if the RXOVIEN (SPIx_FIFCTL[5]) is set to 1.

- Receive FIFO time-out interrupt

If there is a received data in the FIFO buffer and it is not read by software over 64 SPI peripheral clock periods in Master mode or over 576 SPI peripheral clock periods in Slave mode, it will send a RX time-out interrupt to the system if the RX time-out interrupt enable bit, RXTOIEN (SPIx_FIFCTL[4]), is set to 1.

- Transmit FIFO interrupt

In FIFO mode, if the valid data count of the transmit FIFO buffer is less than or equal to the setting value of TXTH (SPIx_FIFCTL[30:28]), the transmit FIFO interrupt flag TXTHIF (SPIx_STATUS[18]) will be set to 1. The SPI controller will generate a transmit FIFO interrupt to the system if the transmit FIFO interrupt enable bit, TXTHIEN (SPIx_FIFCTL[3]), is set to 1.

- Receive FIFO interrupt

In FIFO mode, if the valid data count of the receive FIFO buffer is larger than the setting value of RXTH (SPIx_FIFCTL[26:24]), the receive FIFO interrupt flag RXTHIF (SPIx_STATUS[10]) will be set to 1. The SPI controller will generate a receive FIFO interrupt to the system if the receive FIFO interrupt enable bit, RXTHIEN (SPIx_FIFCTL[2]), is set to 1.

6.15.5.9 I²S Mode

The SPI0 controllers support I²S mode with PCM mode A, PCM mode B, MSB justified and I²S data format. The bit count of an audio channel is determined by WDWIDTH (SPIx_I2SCTL[5:4]). The transfer sequence is always first from the most significant bit, MSB. Data are read on rising clock edge and are driven on falling clock edge.

In I²S data format, the MSB is sent and latched on the second clock of an audio channel. The I2Sx_LRCLK signal indicates which audio channel is in transferring.

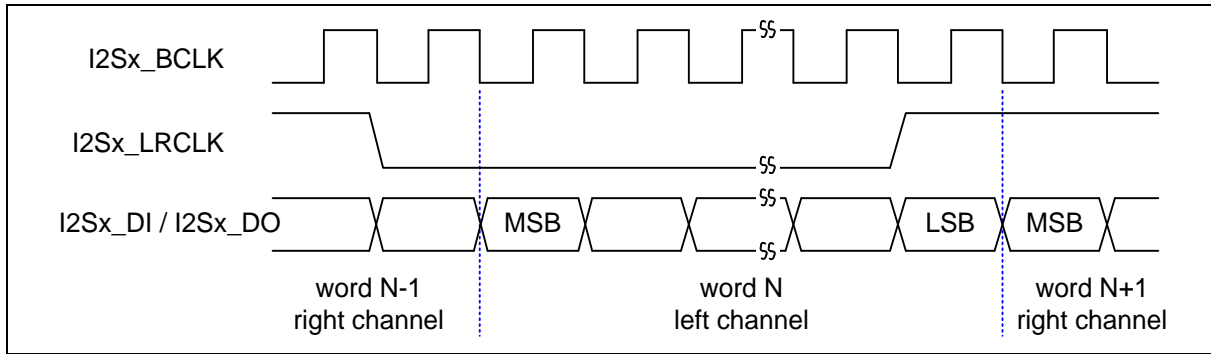

Figure 6.15-19 I²S Data Format Timing Diagram

In MSB justified data format, the MSB is sent and latched on the first clock of an audio channel.

Figure 6.15-20 MSB Justified Data Format Timing Diagram

The I2Sx_LRCLK signal also supports PCM mode A and PCM mode B. The I2Sx_LRCLK signal in PCM mode indicates the beginning of an audio frame.

6.15.5.11 Dummy Data Number for I²S / PCM Master mode and Monaural Mode

Before I²S / PCM master starts to send TX data to external slave device, we set control registers I2SEN (SPIx_I2SCTL[0]) enable, TXEN (SPIx_I2SCTL[1]) enable, and write TX data to TX FIFO. After master sends dummy data (data with zero value) to external slave device, master will send TX FIFO data to external slave device. Table 6.15-2 shows number of dummy data for monaural mode, and the unit of dummy data number is L channel + R channel.

Data Width (SPIx_I2SCTL[5:4])	Dummy Data Number (Unit = L Channel + R Channel)
8 bits	0
16 bits	0
24 bits	1
32 bits	1

Table 6.15-2 Dummy Data Number for I²S / PCM Master Mode and Monaural Mode

6.15.5.12 Dummy Data Number for I²S / PCM Master mode and Stereo Mode

Before I²S / PCM master starts to send TX data to external slave device, we set control registers I2SEN (SPIx_I2SCTL[0]) enable, TXEN (SPIx_I2SCTL[1]) enable, and write TX data to TX FIFO. After master sends dummy data (data with zero value) to external slave device, master will send TX FIFO data to external slave device. Table 6.15-3 shows number of dummy data for stereo mode, and the unit of dummy data number is L channel + R channel.

Data Width (SPIx_I2SCTL[5:4])	Dummy Data Number (Unit = L Channel + R Channel)
8 bits	0
16 bits	0
24 bits	1
32 bits	1

Table 6.15-3 Dummy Data Number for I²S / PCM Master Mode and Stereo Mode

6.15.5.13 Dummy Data Number for I²S Slave mode and Monaural Mode

Before I²S / PCM slave starts to send TX data to external master device, we set control registers I2SEN (SPIx_I2SCTL[0]) enable, TXEN (SPIx_I2SCTL[1]) enable, SLAVE mode (SPIx_I2SCTL[8]), and write TX data to TX FIFO. After slave sends dummy data (data with zero value) to external master device, slave will send TX FIFO data to external master device. Table 6.15-4 shows number of dummy data for I²S slave monaural mode, and the unit of dummy data number is L channel + R channel.

Data Width (SPIx_I2SCTL[5:4])	Dummy Data Number (Unit = L Channel + R Channel)
8 bits	3
16 bits	2
24 bits	2
32 bits	2

Table 6.15-4 Dummy Data Number for I²S Slave Mode and Monaural Mode

6.15.5.14 Dummy Data Number for PCM Slave mode and Monaural Mode

Before I²S / PCM slave starts to send TX data to external master device, we set control registers I2SEN (SPIx_I2SCTL[0]) enable, TXEN (SPIx_I2SCTL[1]) enable, SLAVE mode (SPIx_I2SCTL[8]), and write

TX data to TX FIFO. After slave sends dummy data (data with zero value) to external master device, slave will send TX FIFO data to external master device. Table 6.15-5 shows number of dummy data for PCM slave monaural mode, and the unit of dummy data number is L channel + R channel.

6.15.6 Timing Diagram

The active state of slave selection signal can be defined by setting the SSACTPOL (SPIx_SSCTL[2]). The SPI clock which is in idle state can be configured as high or low state by setting the CLKPOL (SPIx_CTL[3]). It also provides the bit length of a transaction word in DWIDTH (SPIx_CTL[12:8]), and transmitting/receiving data from MSB or LSB first in LSB (SPIx_CTL[13]). User can also select which edge of SPI clock to transmit/receive data in TXNEG/RXNEG (SPIx_CTL[2:1]). Four SPI timing

diagrams for master/slave operations and the related settings are shown below.

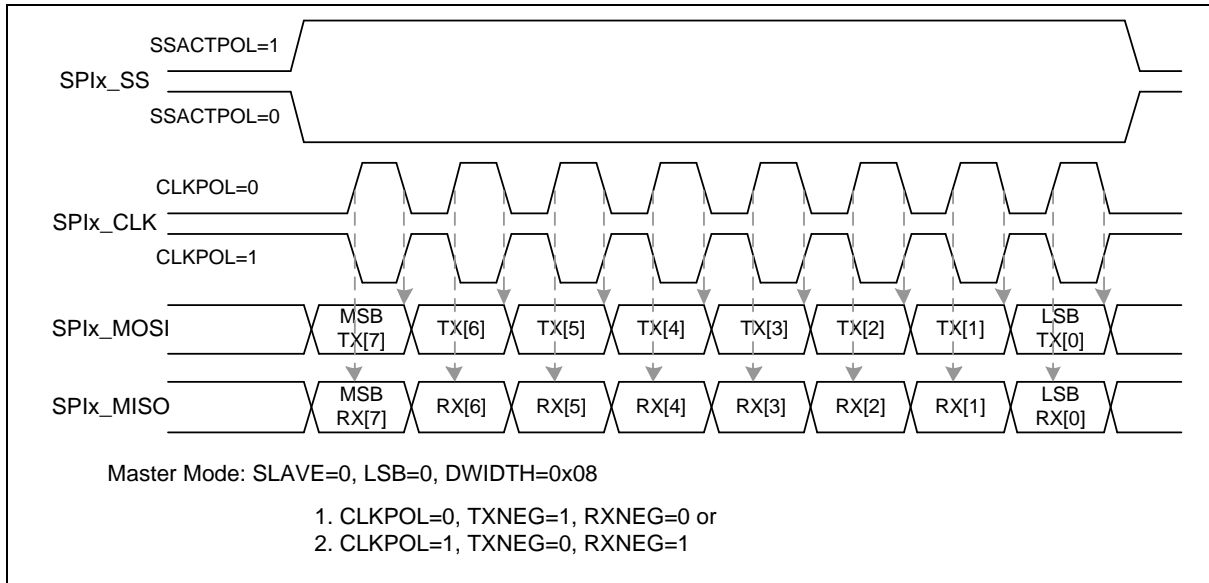

Figure 6.15-25 SPI Timing in Master Mode

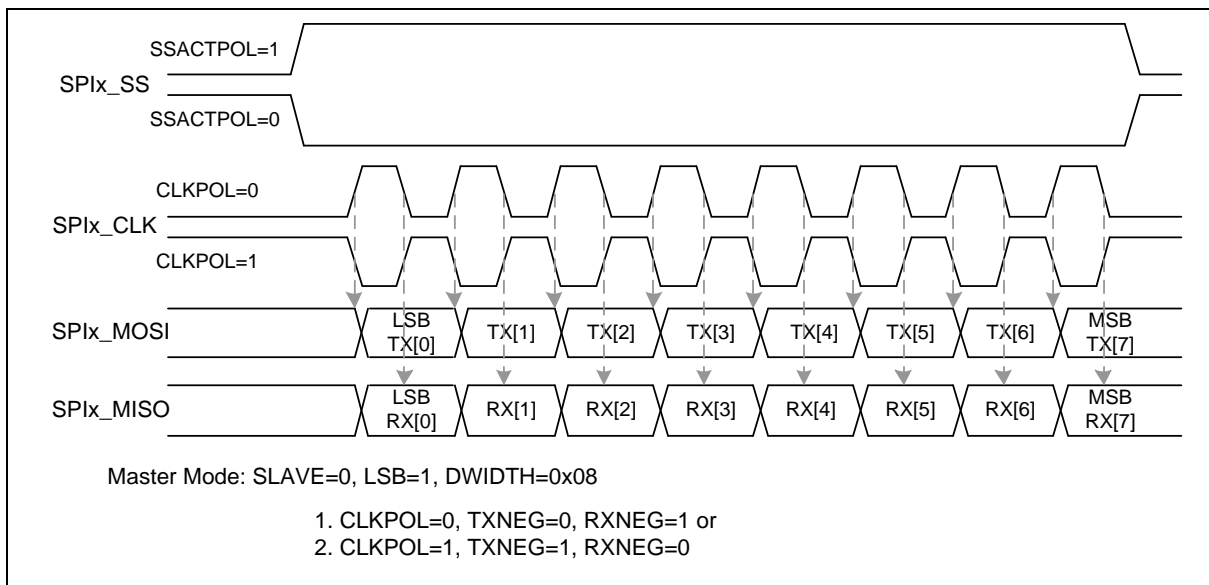

Figure 6.15-26 SPI Timing in Master Mode (Alternate Phase of SPIx_CLK)

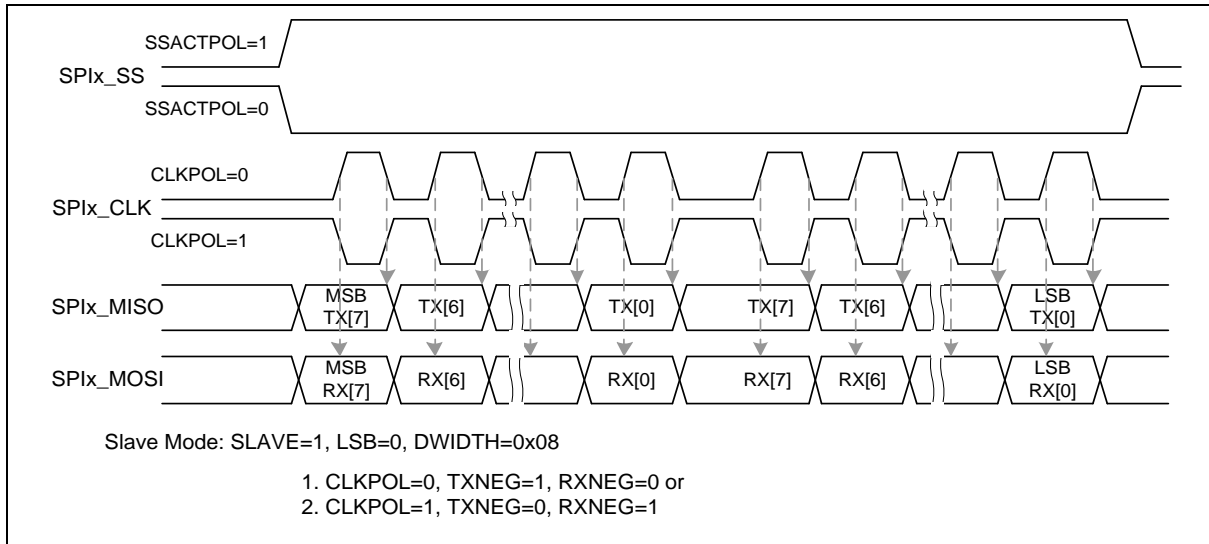

Figure 6.15-27 SPI Timing in Slave Mode

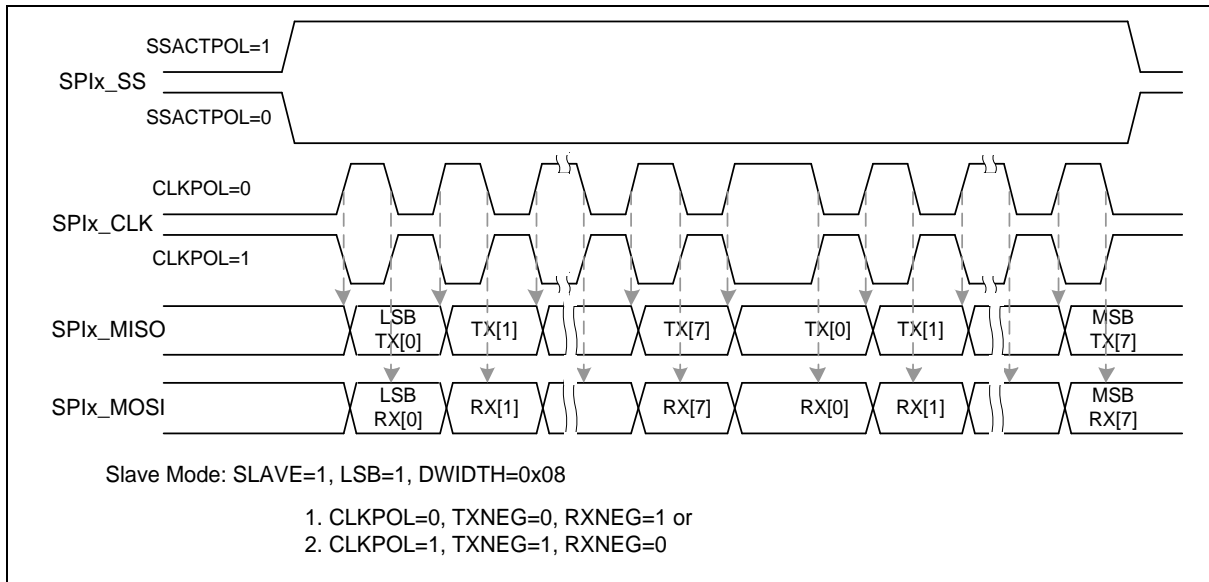

Figure 6.15-28 SPI Timing in Slave Mode (Alternate Phase of SPIx_CLK)

6.15.7 Programming Examples

Example 1:

The SPI controller is set as a full-duplex master to access an off-chip slave device with the following specifications:

- Data bit is latched on positive edge of SPI bus clock.
- Data bit is driven on negative edge of SPI bus clock.
- Data is transferred from MSB first.
- SPI bus clock is idle at low state.
- Only one byte of data to be transmitted/received in a transaction.
- Uses the first SPI slave select pin to connect with an off-chip slave device. The slave

selection signal is active low.

The operation flow is as follows:

1. Set DIVIDER (SPIx_CLKDIV [8:0]) to determine the output frequency of SPI clock.
2. Write the SPIx_SSCTL register a proper value for the related settings of Master mode:
 - 1) Clear AUTOSS (SPIx_SSCTL[3]) to 0 to disable the Automatic Slave Selection function.
 - 2) Configure slave selection signal as active low by clearing SSACTPOL (SPIx_SSCTL[2]) to 0.
 - 3) Enable slave selection signal by setting SS (SPIx_SSCTL[0]) to 1 to activate the off-chip slave device.
3. Write the related settings into the SPIx_CTL register to control the SPI master actions.
 - 1) Configure this SPI controller as master device by setting SLAVE (SPIx_CTL[18]) to 0.
 - 2) Force the SPI clock idle state at low by clearing CLKPOL (SPIx_CTL[3]) to 0.
 - 3) Select data transmitted on negative edge of SPI bus clock by setting TXNEG (SPIx_CTL[2]) to 1.
 - 4) Select data latched on positive edge of SPI bus clock by clearing RXNEG (SPIx_CTL[1]) to 0.
 - 5) Set the bit length of a transaction as 8-bit in DWIDTH bit field (SPIx_CTL[12:8] = 0x08).
 - 6) Set MSB transfer first by clearing LSB (SPIx_CTL[13]) to 0.
4. Set SPIEN (SPIx_CTL[0]) to 1 to enable the data transfer with the SPI interface.
5. If this SPI master attempts to transmit (write) one byte data to the off-chip slave device, write the byte data that will be transmitted into the SPIx_TX register.
6. Waiting for SPI interrupt if the UNITIEN (SPIx_CTL[17]) is set to 1, or just polling the unit transfer interrupt flag UNITIF (SPIx_STATUS[1]).
7. Read out the received one byte data from SPIx_RX register.
8. Go to 5) to continue another data transfer or set SS (SPIx_SSCTL[0]) to 0 to inactivate the off-chip slave device.

Example 2:

The SPI controller is set as a full-duplex slave device and connects with an off-chip master device. The off-chip master device communicates with the on-chip SPI slave controller through the SPI interface with the following specifications:

- Data bit is latched on positive edge of SPI bus clock.
- Data bit is driven on negative edge of SPI bus clock.
- Data is transferred from LSB first.
- SPI bus clock is idle at high state.
- Only one byte of data to be transmitted/received in a transaction.
- Slave selection signal is active high.

The operation flow is as follows:

1. Write the SPIx_SSCTL register a proper value for the related settings of Slave mode.
2. Select high level for the input of slave selection signal by setting SSACTPOL (SPIx_SSCTL[2]) to 1.
3. Write the related settings into the SPIx_CTL register to control this SPI slave actions

- 1) Set the SPI controller as slave device by setting SLAVE (SPIx_CTL[18]) to 1.
- 2) Select the SPI clock idle state at high by setting CLKPOL (SPIx_CTL[3]) to 1.
- 3) Select data transmitted on negative edge of SPI bus clock by setting TXNEG (SPIx_CTL[2]) to 1.
- 4) Select data latched on positive edge of SPI bus clock by clearing RXNEG (SPIx_CTL[1]) to 0.
- 5) Set the bit length of a transaction as 8-bit in DWIDTH bit field (SPIx_CTL[12:8] = 0x08).
4. Set LSB transfer first by setting LSB (SPIx_CTL[13]) to 1.
5. Set the SPIEN (SPIx_CTL[0]) to 1. Wait for the slave select trigger input and SPI clock input from the off-chip master device to start the data transfer.
6. If this SPI slave attempts to transmit (be read) one byte data to the off-chip master device, write the byte data that will be transmitted into the SPIx_TX register.
7. If this SPI slave just only attempts to receive (be written) one byte data from the off-chip master device and does not care what data will be transmitted, the SPIx_TX register does not need to be updated by software.
8. Waiting for SPI interrupt if the UNITIEN (SPIx_CTL[17]) is set to 1, or just polling the unit transfer interrupt flag UNITIF (SPIx_STATUS[1]).
9. Read out the received one byte data from SPIx_RX register.
10. Go to 7 to continue another data transfer or stop data transfer.

6.15.8 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
SPI Base Address:				
SPIx_BA = 0x4006_1000				
x=0				
SPIx_CTL	SPIx_BA+0x00	R/W	SPI Control Register	0x0000_0034

6.15.9 Register Description

SPI Control Register (SPIx_CTL)

Register	Offset	R/W	Description	Reset Value
SPIx_CTL	SPIx_BA+0x00	R/W	SPI Control Register	0x0000_0034

Note: Not supported in I²S mode.

31	30	29	28	27	26	25	24	
Reserved								
23	22	21	20	19	18	17	16	
Reserved			DATDIR	REORDER	SLAVE	UNITIEN	Reserved	
15	14	13	12	11	10	9	8	
RXONLY	HALFDPX	LSB	DWIDTH					
7	6	5	4	3	2	1	0	
SUSPITV				CLKPOL	TXNEG	RXNEG	SPIEN	

Bits	Description	
[31:21]	Reserved	Reserved.
[20]	DATDIR	<p>Data Port Direction Control</p> <p>This bit is used to select the data input/output direction in half-duplex transfer and Dual/Quad transfer</p> <p>0 = SPI data is input direction.</p> <p>1 = SPI data is output direction.</p>
[19]	REORDER	<p>Byte Reorder Function Enable Bit</p> <p>0 = Byte Reorder function Disabled.</p> <p>1 = Byte Reorder function Enabled. A byte suspend interval will be inserted among each byte. The period of the byte suspend interval depends on the setting of SUSPITV.</p> <p>Note: Byte Reorder function is only available if DWIDTH is defined as 16, 24, and 32 bits.</p>
[18]	SLAVE	<p>Slave Mode Control</p> <p>0 = Master mode.</p> <p>1 = Slave mode.</p>
[17]	UNITIEN	<p>Unit Transfer Interrupt Enable Bit</p> <p>0 = SPI unit transfer interrupt Disabled.</p> <p>1 = SPI unit transfer interrupt Enabled.</p>
[16]	Reserved	Reserved.
[15]	RXONLY	<p>Receive-only Mode Enable Bit (Master Only)</p> <p>This bit field is only available in Master mode. In receive-only mode, SPI Master will generate SPI bus clock continuously for receiving data bit from SPI slave device and assert the BUSY status.</p> <p>0 = Receive-only mode Disabled.</p> <p>1 = Receive-only mode Enabled.</p>
[14]	HALFDPX	<p>SPI Half-duplex Transfer Enable Bit</p> <p>This bit is used to select full-duplex or half-duplex for SPI transfer. The bit field DATDIR</p>

		(SPIx_CTL[20]) can be used to set the data direction in half-duplex transfer. 0 = SPI operates in full-duplex transfer. 1 = SPI operates in half-duplex transfer.
[13]	LSB	Send LSB First 0 = The MSB, which bit of transmit/receive register depends on the setting of DWIDTH, is transmitted/received first. 1 = The LSB, bit 0 of the SPI TX register, is sent first to the SPI data output pin, and the first bit received from the SPI data input pin will be put in the LSB position of the RX register (bit 0 of SPI_RX).
[12:8]	DWIDTH	Data Width This field specifies how many bits can be transmitted / received in one transaction. The minimum bit length is 8 bits and can up to 32 bits. DWIDTH = 0x08 8 bits. DWIDTH = 0x09 9 bits. DWIDTH = 0x1F 31 bits. DWIDTH = 0x00 32 bits. Note: This bit field will decide the depth of TX/RX FIFO configuration in SPI mode. Therefore, changing this bit field will clear TX/RX FIFO by hardware automatically.
[7:4]	SUSPITV	Suspend Interval (Master Only) The four bits provide configurable suspend interval between two successive transmit/receive transaction in a transfer. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value is 0x3. The period of the suspend interval is obtained according to the following equation. $(SUSPITV + 0.5) * \text{period of SPICLK clock cycle}$ Example: SUSPITV = 0x0 0.5 SPICLK clock cycle. SUSPITV = 0x1 1.5 SPICLK clock cycle. SUSPITV = 0xE 14.5 SPICLK clock cycle. SUSPITV = 0xF 15.5 SPICLK clock cycle.
[3]	CLKPOL	Clock Polarity 0 = SPI bus clock is idle low. 1 = SPI bus clock is idle high.
[2]	TXNEG	Transmit on Negative Edge 0 = Transmitted data output signal is changed on the rising edge of SPI bus clock. 1 = Transmitted data output signal is changed on the falling edge of SPI bus clock.
[1]	RXNEG	Receive on Negative Edge 0 = Received data input signal is latched on the rising edge of SPI bus clock. 1 = Received data input signal is latched on the falling edge of SPI bus clock.
[0]	SPIEN	SPI Transfer Control Enable Bit In Master mode, the transfer will start when there is data in the FIFO buffer after this bit is set to 1. In Slave mode, this device is ready to receive data when this bit is set to 1. 0 = Transfer control Disabled. 1 = Transfer control Enabled. Note: Before changing the configurations of SPIx_CTL, SPIx_CLKDIV, SPIx_SSCTL and SPIx_FIFOCFL registers, user shall clear the SPIEN (SPIx_CTL[0]) and confirm the SPIENSTS (SPIx_STATUS[15]) is 0.

M251/M252 SERIES TECHNICAL REFERENCE MANUAL

SPI Clock Divider Register (SPIx_CLKDIV)

Register	Offset	R/W	Description	Reset Value
SPIx_CLKDIV	SPIx_BA+0x04	R/W	SPI Clock Divider Register	0x0000_0000

Reserved							DIVIDER
7	6	5	4	3	2	1	0
DIVIDER							

Bits	Description
[31:9]	Reserved Reserved.
[8:0]	<p>DIVIDER</p> <p>Clock Divider The value in this field is the frequency divider for generating the peripheral clock, f_{spi_eclk}, and the SPI bus clock of SPI Master. The frequency is obtained according to the following equation.</p> $f_{spi_eclk} = \frac{f_{spi_clock_src}}{(DIVIDER + 1)}$ <p>where</p> <p>$f_{spi_clock_src}$ is the peripheral clock source, which is defined in the clock control register, CLK_CLKSEL2.</p> <p>Note 1: Not supported in I²S mode.</p> <p>Note 2: The time interval must be larger than or equal 8 peripheral clock cycles between releasing SPI IP software reset and setting this clock divider register.</p>

Note: DIVIDER should be set carefully because the peripheral clock frequency must be slower than or equal to system frequency.

SPI Slave Select Control Register (SPIx_SSCTL)

Register	Offset	R/W	Description	Reset Value
SPIx_SSCTL	SPIx_BA+0x08	R/W	SPI Slave Select Control Register	0x0000_0000

Note: Not supported in I²S mode.

31	30	29	28	27	26	25	24

Bits	Description	
[31:14]	Reserved	Reserved.
[13]	SSINAIEN	Slave Select Inactive Interrupt Enable Bit 0 = Slave select inactive interrupt Disabled. 1 = Slave select inactive interrupt Enabled.
[12]	SSACTIEN	Slave Select Active Interrupt Enable Bit 0 = Slave select active interrupt Disabled. 1 = Slave select active interrupt Enabled.
[11:10]	Reserved	Reserved.
[9]	SLVURIEN	Slave Mode TX Under Run Interrupt Enable Bit 0 = Slave mode TX under run interrupt Disabled. 1 = Slave mode TX under run interrupt Enabled.
[8]	SLVBEIEN	Slave Mode Bit Count Error Interrupt Enable Bit 0 = Slave mode bit count error interrupt Disabled. 1 = Slave mode bit count error interrupt Enabled.
[7:4]	Reserved	Reserved.
[3]	AUTOSS	Automatic Slave Selection Function Enable Bit (Master Only) 0 = Automatic slave selection function Disabled. Slave selection signal will be asserted/de-asserted according to SS (SPIx_SSCTL[0]). 1 = Automatic slave selection function Enabled.
[2]	SSACTPOL	Slave Selection Active Polarity This bit defines the active polarity of slave selection signal (SPIx_SS). 0 = The slave selection signal SPIx_SS is active low. 1 = The slave selection signal SPIx_SS is active high.
[1]	Reserved	Reserved.

[0]	SS	<p>Slave Selection Control (Master Only)</p> <p>If AUTOSS bit is cleared to 0, 0 = set the SPIx_SS line to inactive state. 1 = set the SPIx_SS line to active state.</p> <p>If the AUTOSS bit is set to 1, 0 = Keep the SPIx_SS line at inactive state. 1 = SPIx_SS line will be automatically driven to active state for the duration of data transfer, and will be driven to inactive state for the rest of the time. The active state of SPIx_SS is specified in SSACTPOL (SPIx_SSCTL[2]).</p>

Reserved					PDMARST	RXPDMAEN	TXPDMAEN

Bits	Description	
[31:3]	Reserved	Reserved.
[2]	PDMARST	PDMA Reset 0 = No effect. 1 = Reset the PDMA control logic of the SPI controller. This bit will be automatically cleared to 0.
[1]	RXPDMAEN	Receive PDMA Enable Bit 0 = Receive PDMA function Disabled. 1 = Receive PDMA function Enabled.
[0]	TXPDMAEN	Transmit PDMA Enable Bit 0 = Transmit PDMA function Disabled. 1 = Transmit PDMA function Enabled. Note: In SPI Master mode with full duplex transfer, if both TX and RX PDMA functions are enabled, RX PDMA function cannot be enabled prior to TX PDMA function. User can enable TX PDMA function firstly or enable both functions simultaneously.

SPI FIFO Control Register (SPIx_FIFOCTL)

Register	Offset	R/W	Description	Reset Value
SPIx_FIFOCTL	SPIx_BA+0x10	R/W	SPI FIFO Control Register	0x2200_0000

31	30	29	28	27	26	25	24
Reserved	TXTH			Reserved	RXTH		
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved						TXFBCLR	RXFBCLR
7	6	5	4	3	2	1	0
TXUFIEN	TXUFPOL	RXOVIEEN	RXTOIEEN	TXTHIEN	RXTHIEN	TXRST	RXRST

Bits	Description
[31]	Reserved Reserved.
[30:28]	TXTH Transmit FIFO Threshold If the valid data count of the transmit FIFO buffer is less than or equal to the TXTH setting, the TXTHIF bit will be set to 1, else the TXTHIF bit will be cleared to 0. The MSB of this bit field is only meaningful while SPI mode 8~16 bits of data length.
[27]	Reserved Reserved.
[26:24]	RXTH Receive FIFO Threshold If the valid data count of the receive FIFO buffer is larger than the RXTH setting, the RXTHIF bit will be set to 1, else the RXTHIF bit will be cleared to 0. The MSB of this bit field is only meaningful while SPI mode 8~16 bits of data length.
[23:10]	Reserved Reserved.
[9]	TXFBCLR Transmit FIFO Buffer Clear 0 = No effect. 1 = Clear transmit FIFO pointer. The TXFULL bit will be cleared to 0 and the TXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 1 system clock after it is set to 1. Note: The TX shift register will not be cleared.
[8]	RXFBCLR Receive FIFO Buffer Clear 0 = No effect. 1 = Clear receive FIFO pointer. The RXFULL bit will be cleared to 0 and the RXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 1 system clock after it is set to 1. Note: The RX shift register will not be cleared.
[7]	TXUFIEN TX Underflow Interrupt Enable Bit When TX underflow event occurs in Slave mode, TXUFIF (SPIx_STATUS[19]) will be set to 1. This bit is used to enable the TX underflow interrupt. 0 = Slave TX underflow interrupt Disabled. 1 = Slave TX underflow interrupt Enabled.

[6]	TXUFPOL	<p>TX Underflow Data Polarity</p> <p>0 = The SPI data out is keep 0 if there is TX underflow event in Slave mode. 1 = The SPI data out is keep 1 if there is TX underflow event in Slave mode.</p> <p>Note 1: The TX underflow event occurs if there is no any data in TX FIFO when the slave selection signal is active.</p> <p>Note 2: This bit should be set as 0 in I²S mode.</p> <p>Note 3: When TX underflow event occurs, SPIx_MISO pin state will be determined by this setting even though TX FIFO is not empty afterward. Data stored in TX FIFO will be sent through SPIx_MISO pin in the next transfer frame.</p>
[5]	RXOVIEN	<p>Receive FIFO Overrun Interrupt Enable Bit</p> <p>0 = Receive FIFO overrun interrupt Disabled. 1 = Receive FIFO overrun interrupt Enabled.</p>
[4]	RXTOIEN	<p>Slave Receive Time-out Interrupt Enable Bit</p> <p>0 = Receive time-out interrupt Disabled. 1 = Receive time-out interrupt Enabled.</p>
[3]	TXTHIEN	<p>Transmit FIFO Threshold Interrupt Enable Bit</p> <p>0 = TX FIFO threshold interrupt Disabled. 1 = TX FIFO threshold interrupt Enabled.</p>
[2]	RXTHIEN	<p>Receive FIFO Threshold Interrupt Enable Bit</p> <p>0 = RX FIFO threshold interrupt Disabled. 1 = RX FIFO threshold interrupt Enabled.</p>
[1]	TXRST	<p>Transmit Reset</p> <p>0 = No effect. 1 = Reset transmit FIFO pointer and transmit circuit. The TXFULL bit will be cleared to 0 and the TXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 3 system clock cycles + 2 peripheral clock cycles after it is set to 1. User can read TXRXRST (SPIx_STATUS[23]) to check if reset is accomplished or not.</p> <p>Note: If TX underflow event occurs in SPI Slave mode, this bit can be used to make SPI return to idle state.</p>
[0]	RXRST	<p>Receive Reset</p> <p>0 = No effect. 1 = Reset receive FIFO pointer and receive circuit. The RXFULL bit will be cleared to 0 and the RXEMPTY bit will be set to 1. This bit will be cleared to 0 by hardware about 3 system clock cycles + 2 peripheral clock cycles after it is set to 1. User can read TXRXRST (SPIx_STATUS[23]) to check if reset is accomplished or not.</p>

SPI Status Register (SPIx STATUS)

Register	Offset	R/W	Description	Reset Value
SPIx_STATUS	SPIx_BA+0x14	R/W	SPI Status Register	0x0005_0110

Note: Not supported in I²S mode.

31	30	29	28	27	26	25	24
TXCNT				RXCNT			
23	22	21	20	19	18	17	16
TXRXRST	Reserved			TXUFIF	TXTHIF	TXFULL	TXEMPTY
15	14	13	12	11	10	9	8
SPIENSTS	Reserved			RXTOIF	RXOVIF	RXTHIF	RXFULL
7	6	5	4	3	2	1	0
SLVURIF	SLVBEIF	Reserved	SSLINE	SSINAIF	SSACTIF	UNITIF	BUSY

Bits	Description	
[31:28]	TXCNT	Transmit FIFO Data Count (Read Only) This bit field indicates the valid data count of transmit FIFO buffer.
[27:24]	RXCNT	Receive FIFO Data Count (Read Only) This bit field indicates the valid data count of receive FIFO buffer.
[23]	TXRXRST	TX or RX Reset Status (Read Only) 0 = The reset function of TXRST or RXRST is done. 1 = Doing the reset function of TXRST or RXRST. Note: Both the reset operations of TXRST and RXRST need 3 system clock cycles + 2 peripheral clock cycles. User can check the status of this bit to monitor the reset function is doing or done.
[22:20]	Reserved	Reserved.
[19]	TXUFIF	TX Underflow Interrupt Flag When the TX underflow event occurs, this bit will be set to 1, the state of data output pin depends on the setting of TXUFPOL. 0 = No effect. 1 = No data in Transmit FIFO and TX shift register when the slave selection signal is active. Note 1: This bit will be cleared by writing 1 to it. Note 2: If reset slave's transmission circuit when slave selection signal is active, this flag will be set to 1 after 2 peripheral clock cycles + 3 system clock cycles since the reset operation is done.
[18]	TXTHIF	Transmit FIFO Threshold Interrupt Flag (Read Only) 0 = The valid data count within the transmit FIFO buffer is larger than the setting value of TXTH. 1 = The valid data count within the transmit FIFO buffer is less than or equal to the setting value of TXTH.
[17]	TXFULL	Transmit FIFO Buffer Full Indicator (Read Only) 0 = Transmit FIFO buffer is not full.

		1 = Transmit FIFO buffer is full.
[16]	TXEMPTY	Transmit FIFO Buffer Empty Indicator (Read Only) 0 = Transmit FIFO buffer is not empty. 1 = Transmit FIFO buffer is empty.
[15]	SPIENSTS	SPI Enable Status (Read Only) 0 = SPI controller Disabled. 1 = SPI controller Enabled. Note: The SPI peripheral clock is asynchronous with the system clock. In order to make sure the SPI control logic is disabled, this bit indicates the real status of SPI controller.
[14:13]	Reserved	Reserved.
[12]	RXTOIF	Receive Time-out Interrupt Flag 0 = No receive FIFO time-out event. 1 = Receive FIFO buffer is not empty and no read operation on receive FIFO buffer over 64 SPI peripheral clock periods in Master mode or over 576 SPI peripheral clock periods in Slave mode. When the received FIFO buffer is read by software, the time-out status will be cleared automatically. Note: This bit will be cleared by writing 1 to it.
[11]	RXOVIF	Receive FIFO Overrun Interrupt Flag When the receive FIFO buffer is full, the follow-up data will be dropped and this bit will be set to 1. 0 = No FIFO is overrun. 1 = Receive FIFO is overrun. Note: This bit will be cleared by writing 1 to it.
[10]	RXTHIF	Receive FIFO Threshold Interrupt Flag (Read Only) 0 = The valid data count within the receive FIFO buffer is smaller than or equal to the setting value of RXTH. 1 = The valid data count within the receive FIFO buffer is larger than the setting value of RXTH.
[9]	RXFULL	Receive FIFO Buffer Full Indicator (Read Only) 0 = Receive FIFO buffer is not full. 1 = Receive FIFO buffer is full.
[8]	RXEMPTY	Receive FIFO Buffer Empty Indicator (Read Only) 0 = Receive FIFO buffer is not empty. 1 = Receive FIFO buffer is empty.
[7]	SLVURIF	Slave Mode TX Under Run Interrupt Flag In Slave mode, if TX underflow event occurs and the slave select line goes to inactive state, this interrupt flag will be set to 1. 0 = No Slave TX under run event. 1 = Slave TX under run event occurred. Note: This bit will be cleared by writing 1 to it.
[6]	SLVBEIF	Slave Mode Bit Count Error Interrupt Flag In Slave mode, when the slave select line goes to inactive state, if bit counter is mismatch with DWIDTH, this interrupt flag will be set to 1. 0 = No Slave mode bit count error event. 1 = Slave mode bit count error event occurred. Note: If the slave select active but there is no any bus clock input, the SLVBEIF also active when the slave select goes to inactive state. This bit will be cleared by writing 1 to it.
[5]	Reserved	Reserved.

[4]	SSLINE	<p>Slave Select Line Bus Status (Read Only)</p> <p>0 = The slave select line status is 0. 1 = The slave select line status is 1.</p> <p>Note: This bit is only available in Slave mode. If SSACTPOL (SPIx_SSCTL[2]) is set 0, and the SSLINE is 1, the SPI slave select is in inactive status.</p>
[3]	SSINAIF	<p>Slave Select Inactive Interrupt Flag</p> <p>0 = Slave select inactive interrupt was cleared or not occurred. 1 = Slave select inactive interrupt event occurred.</p> <p>Note: Only available in Slave mode. This bit will be cleared by writing 1 to it.</p>
[2]	SSACTIF	<p>Slave Select Active Interrupt Flag</p> <p>0 = Slave select active interrupt was cleared or not occurred. 1 = Slave select active interrupt event occurred.</p> <p>Note: Only available in Slave mode. This bit will be cleared by writing 1 to it.</p>
[1]	UNITIF	<p>Unit Transfer Interrupt Flag</p> <p>0 = No transaction has been finished since this bit was cleared to 0. 1 = SPI controller has finished one unit transfer.</p> <p>Note: This bit will be cleared by writing 1 to it.</p>
[0]	BUSY	<p>Busy Status (Read Only)</p> <p>0 = SPI controller is in idle state. 1 = SPI controller is in busy state.</p> <p>The following lists the bus busy conditions:</p> <ol style="list-style-type: none"> SPIEN (SPIx_CTL[0]) = 1 and TXEMPTY = 0. For SPI Master mode, SPIEN (SPIx_CTL[0]) = 1 and TXEMPTY = 1 but the current transaction is not finished yet. For SPI Master mode, SPIEN (SPIx_CTL[0]) = 1 and RXONLY = 1. For SPI Slave mode, SPIEN (SPIx_CTL[0]) = 1 and there is serial clock input into the SPI core logic when slave select is active. For SPI Slave mode, SPIEN (SPIx_CTL[0]) = 1 and the transmit buffer or transmit shift register is not empty even if the slave select is inactive.

SPI Data Transmit Register (SPIx_TX)

Register	Offset	R/W	Description	Reset Value
SPIx_TX	SPIx_BA+0x20	W	SPI Data Transmit Register	0x0000_0000

31	30	29	28	27	26	25	24

TX							
7	6	5	4	3	2	1	0
TX							

Bits	Description
[31:0]	<p>TX</p> <p>Data Transmit Register</p> <p>The data transmit registers pass through the transmitted data into the 4-level transmit FIFO buffers. The number of valid bits depends on the setting of DWIDTH (SPIx_CTL[12:8]) in SPI mode or WDWIDTH (SPIx_I2SCTL[5:4]) in I²S mode.</p> <p>In SPI mode, if DWIDTH is set to 0x08, the bits TX[7:0] will be transmitted. If DWIDTH is set to 0x00, the SPI controller will perform a 32-bit transfer.</p> <p>In I²S mode, if WDWIDTH (SPIx_I2SCTL[5:4]) is set to 0x2, the data width of audio channel is 24-bit and corresponding to TX[23:0]. If WDWIDTH is set as 0x0, 0x1, or 0x3, all bits of this field are valid and referred to the data arrangement in I²S mode FIFO operation section</p> <p>Note: In Master mode, SPI controller will start to transfer the SPI bus clock after 1 APB clock and 6 peripheral clock cycles after user writes to this register.</p>

SPI Data Receive Register (SPIx_RX)

[3:0]	Reserved	Reserved.

6.16 Quad Serial Peripheral Interface (QSPI)

6.16.1 Overview

The Quad Serial Peripheral Interface (QSPI) applies to synchronous serial data communication and allows full duplex transfer. Devices communicate in Master/Slave mode with the 4-wire bi-direction interface. The chip contains one QSPI controller performing a serial-to-parallel conversion on data received from a peripheral device, and a parallel-to-serial conversion on data transmitted to a peripheral device.

The QSPI controller supports 2-bit Transfer mode to perform full-duplex 2-bit data transfer and also supports Dual and Quad I/O Transfer mode and the controller supports the PDMA function to access the data buffer. Please refer to the M251 Datasheet for detailed information about maximum QSPI clock frequency of QSPI master mode and QSPI slave mode and range of QSPI operation voltage.

6.16.2 Features

- Supports one QSPI controller
- Supports Master or Slave mode operation
- Supports 2-bit Transfer mode
- Supports Dual and Quad I/O Transfer mode
- Configurable bit length of a transaction word from 8 to 32-bit
- Provides separate 8-level depth transmit and receive FIFO buffers
- Supports MSB first or LSB first transfer sequence
- Supports Byte Reorder function
- Supports Byte or Word Suspend mode
- Supports PDMA transfer
- Supports 3-Wire, no slave selection signal, bi-direction interface
- Supports one data channel half-duplex transfer
- Supports receive-only mode

6.16.3 Block Diagram

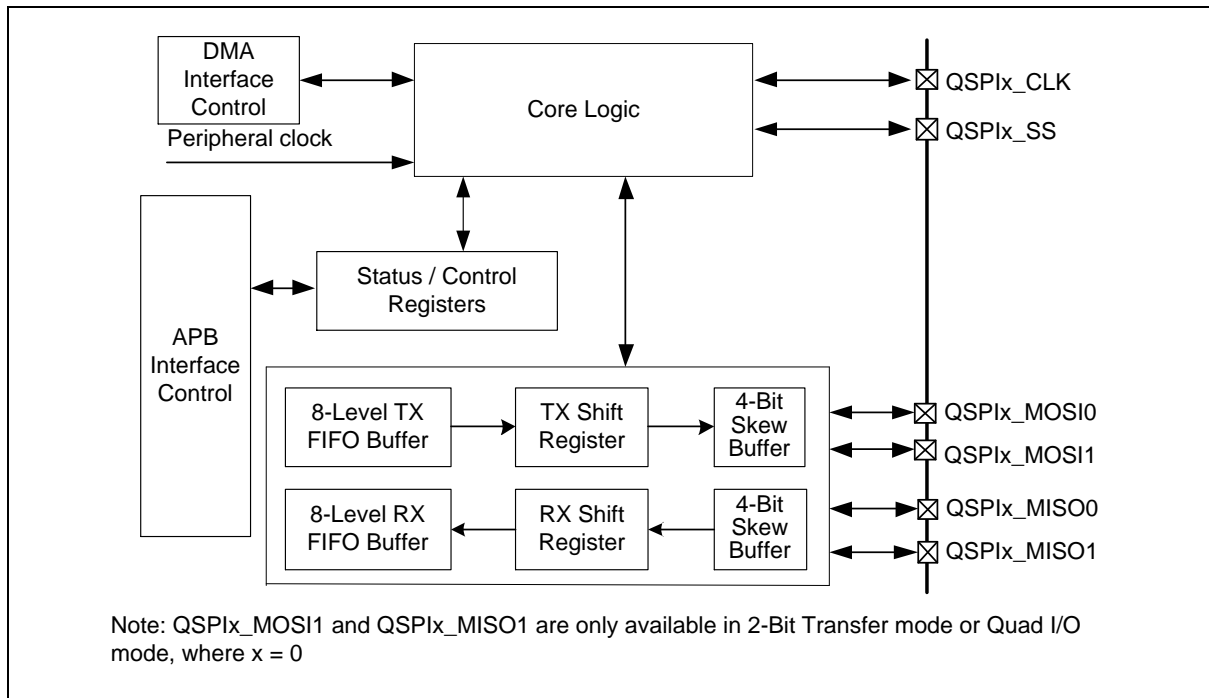

Figure 6.16-1 QSPI Block Diagram

TX FIFO Buffer:

The transmit FIFO buffer is a 8-level depth, 32-bit wide, first-in, first-out register buffer. The data can be written to the transmit FIFO buffer in advance through software by writing the QSPIx_TX register.

RX FIFO Buffer:

The receive FIFO buffer is also a 8-level depth, 32-bit wide, first-in, first-out register buffer. The receive control logic will store the receive data to this buffer. The FIFO buffer data can be read from QSPIx_RX register by software.

TX Shift Register:

The transmit shift register is a 32-bit wide register buffer. The transmit data is loaded from the TX FIFO buffer and shifted out bit-by-bit to the skew buffer.

RX Shift Register:

The receive shift register is also a 32-bit wide register buffer. The receive data is shift in bit-by-bit from the skew buffer and is loaded into RX FIFO buffer when a transaction done.

Skew Buffer:

The skew buffer is a 4-level 1-bit buffer. There are two skew buffers in transmitting and received side. In received side, it is used to shift bits into RX shift register from QSPI bus. In transmitting side, it is used to shift bits into QSPI bus from TX shift register.

6.16.4 Basic Configuration

6.16.4.1 QSPI0 Basic Configuration

- Clock source Configuration
 - Select the source of QSPI0 peripheral clock on QSPI0SEL (CLK_CLKSEL2[3:2]).
 - Enable QSPI0 peripheral clock in QSPI0CKEN (CLK_APBCLK0[12]).

- Reset Configuration
 - Reset QSPI0 controller in QSPI0RST (SYS_IPRST1[12]).
- Pin Configuration

6.16.5 Functional Description

6.16.5.1 Terminology

QSPI Peripheral Clock and QSPI Bus Clock

The QSPI controller needs the peripheral clock to drive the QSPI logic unit to perform the data transfer. The peripheral clock rate is determined by the settings of clock divisor (QSPiX_CLKDIV) and the clock source which can be HXT, PLL, PCLK or HIRC. QSPiXSEL of CLK_CLKSEL2 register determines the clock source of the peripheral clock. The DIVIDER (QSPiX_CLKDIV[8:0]) setting determines the divisor of the clock rate calculation.

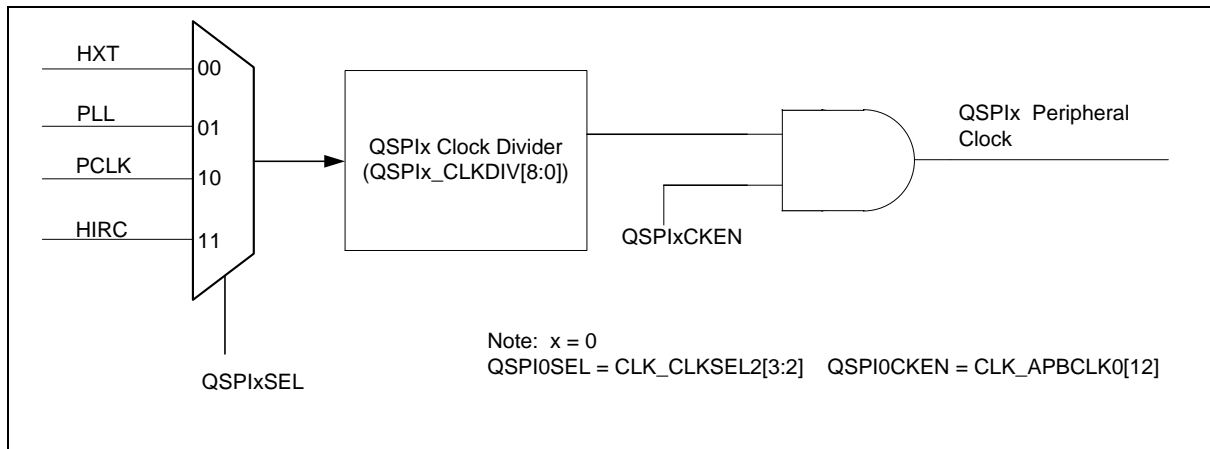

Figure 6.16-2 QSPI Peripheral Clock

In Master mode, the frequency of the QSPI bus clock is equal to the peripheral clock rate. In general, the QSPI bus clock is denoted as QSPI clock. In Slave mode, the QSPI bus clock is provided by a master device. The frequency of QSPI peripheral clock cannot be faster than the system clock rate regardless of Master or Slave mode.

Master/Slave mode

The QSPI controllers can be set as Master or Slave mode by setting the SLAVE (QSPIx_CTL[18]) to communicate with the off-chip SPI slave or master device. The HALFDPX (QSPIx_CTL[14]) can be used to select the full-duplex or half-duplex in QSPI transmission. The application block diagrams in Master and Slave mode are shown below.

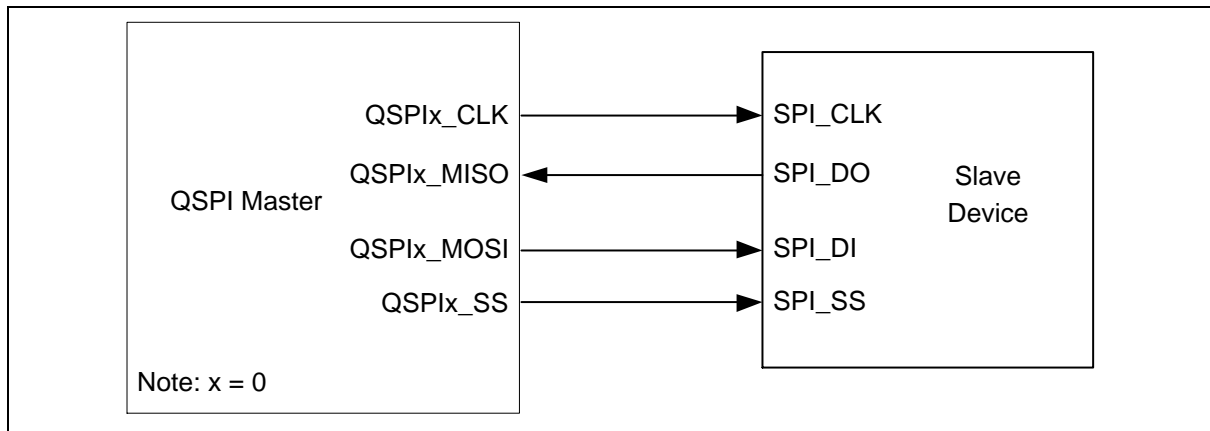

Figure 6.16-3 QSPI Full-Duplex Master Mode Application Block Diagram

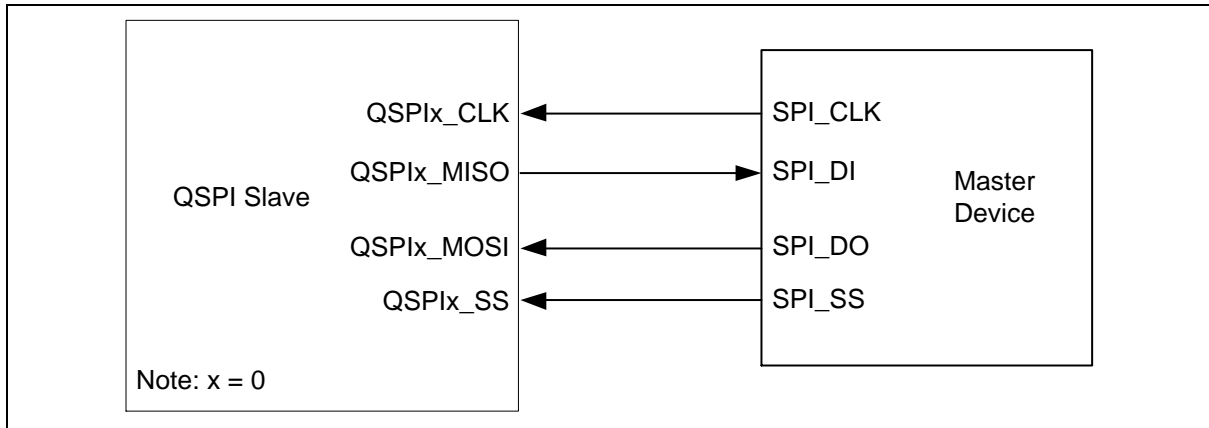

Figure 6.16-4 QSPI Full-Duplex Slave Mode Application Block Diagram

Slave Selection

In Master mode, the QSPI controller can drive off-chip slave device through the slave select output pin QSPiX_SS. In Slave mode, the off-chip master device drives the slave selection signal from the QSPiX_SS input port to this QSPI controller. The duration between the slave select active edge and the first QSPI clock input shall over 3 QSPI peripheral clock cycles of slave.

In Master/Slave mode, the active state of slave selection signal can be programmed to low or high active in SSACTPOL (QSPiX_SSCTL[2]). The selection of slave select conditions depends on what type of device is connected. In Slave mode, to recognize the inactive state of the slave selection signal, the inactive period of the slave selection signal must be larger than or equal to 3 peripheral clock cycles between two successive transactions.

Timing Condition

The CLKPOL (QSPiX_CTL[3]) defines the QSPI clock idle state. If CLKPOL = 1, the output QSPI clock is idle at high state; if CLKPOL = 0, it is idle at low state.

TXNEG (QSPiX_CTL[2]) defines the data transmitted out either on negative edge or on positive edge of QSPI clock. RXNEG (QSPiX_CTL[1]) defines the data received either on negative edge or on positive edge of QSPI clock.

Note: The settings of TXNEG and RXNEG are mutual exclusive. In other words, do not transmit and receive data at the same clock edge.

Transmit/Receive Bit Length

The bit length of a transaction word is defined in DWIDTH (QSPiX_CTL[12:8]) and can be configured up to 32-bit length in a transaction word for transmitting and receiving.

When QSPI controller finishes a transaction, i.e. receives or transmits a specific count of bits defined in DWIDTH (QSPiX_CTL[12:8]), the unit transfer interrupt flag UNITIF (QSPiX_STATUS[1]) will be set to 1.

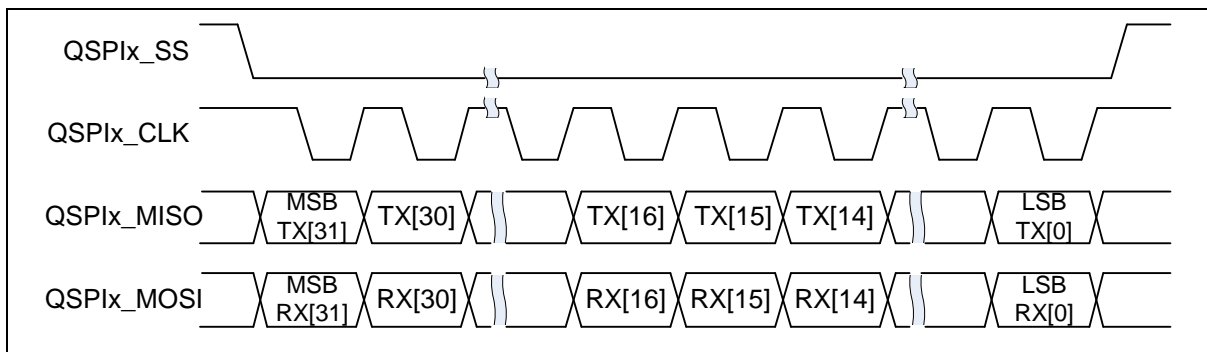

Figure 6.16-532-bit in One Transaction

LSB/MSB First

LSB (QSPiX_CTL[13]) defines the bit transfer sequence in a transaction. If the LSB (QSPiX_CTL[13]) is set to 1, the transfer sequence is LSB first. The bit 0 will be transferred firstly. If the LSB (QSPiX_CTL[13]) is cleared to 0, the transfer sequence is MSB first.

Suspend Interval

SUSPITV (QSPiX_CTL[7:4]) provides a configurable suspend interval, 0.5 ~ 15.5 QSPI clock periods, between two successive transaction words in Master mode. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value of SUSPITV is 0x3 (3.5 QSPI clock cycles).

6.16.5.2 Automatic Slave Selection

In Master mode, if AUTOSS (QSPiX_SSCTL[3]) is set, the slave selection signal will be generated automatically and output to the QSPiX_SS pin according to whether SS (QSPiX_SSCTL[0]) is enabled or not. The slave selection signal will be set to active state by the QSPI controller when the QSPI data transfer is started by writing to FIFO. It will be set to inactive state when QSPI bus is idle. If QSPI bus is not idle, i.e. TX FIFO, TX shift register or TX skew buffer is not empty, the slave selection signal will be set to inactive state between transactions if the value of SUSPITV (QSPiX_CTL[7:4]) is greater than or equal to 3.

In Master mode, if the value of SUSPITV is less than 3 and the AUTOSS is set as 1, the slave selection signal will be kept at active state between two successive transactions.

If the AUTOSS bit is cleared, the slave selection output signal will be determined by the SS setting. The active state of the slave selection output signal is specified in SSACTPOL (QSPiX_SSCTL[2]).

The duration between the slave selection signal active edge and the first QSPI bus clock edge is 1 QSPI bus clock cycle and the duration between the last QSPI bus clock and the slave selection signal inactive edge is 1.5 QSPI bus clock cycle.

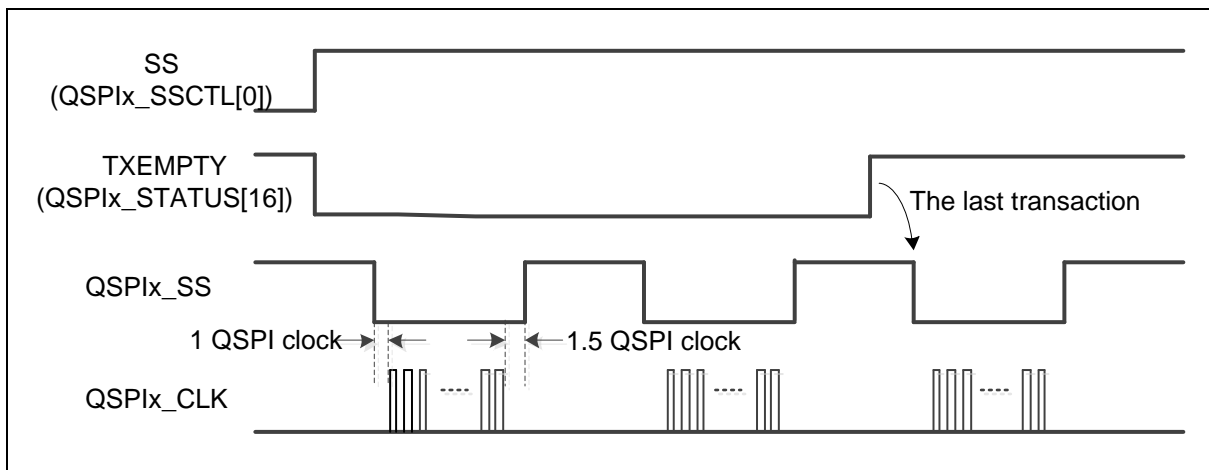

Figure 6.16-6 Automatic Slave Selection (SSACTPOL = 0, SUSPITV > 0x2)

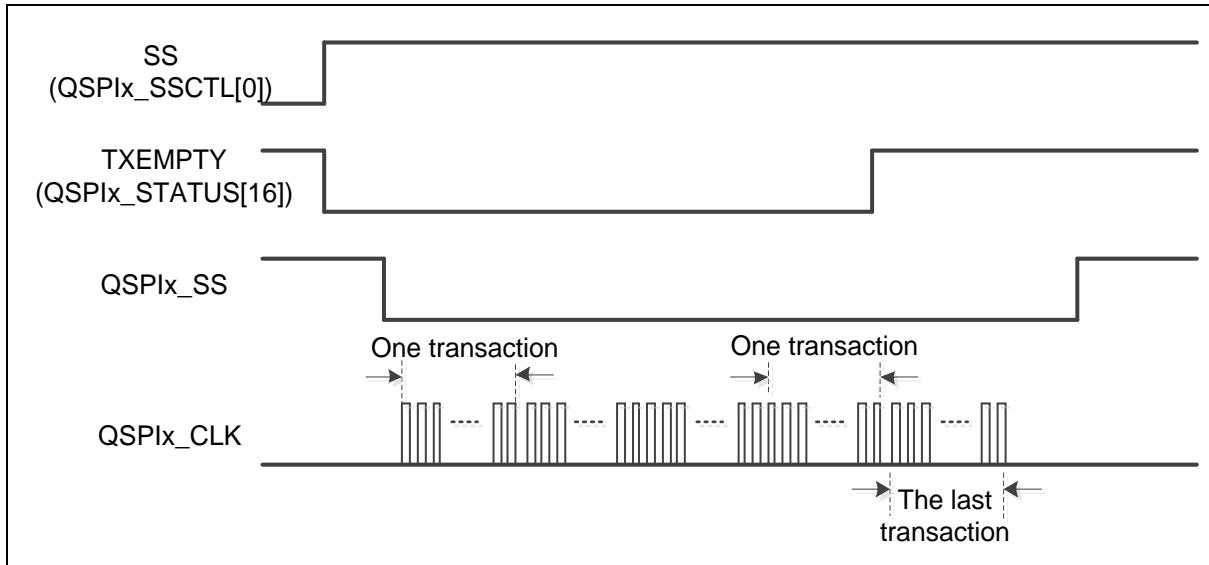

Figure 6.16-7 Automatic Slave Selection (SSACTPOL = 0, SUSPITV < 0x3)

6.16.5.3 Byte Reorder and Suspend Function

When the transfer is set as MSB first (LSB = 0) and the REORDER (QSPIx_CTL[19]) is set to 1, the data stored in the TX buffer and RX buffer will be rearranged in the order as [Byte0, Byte1, Byte2, Byte3] in 32-bit transfer (DWIDTH = 0). The sequence of transmitted/received data will be Byte0, Byte1, Byte2, and then Byte3. If the DWIDTH is set as 24-bit transfer mode, the data in TX buffer and RX buffer will be rearranged as [unknown byte, Byte0, Byte1, Byte2]. The QSPI controller will transmit/receive data with the sequence of Byte0, Byte1 and then Byte2. Each byte will be transmitted/received with MSB first. The rule of 16-bit mode is the same as above. Byte Reorder function is only available when DWIDTH is configured as 16, 24, and 32 bits.

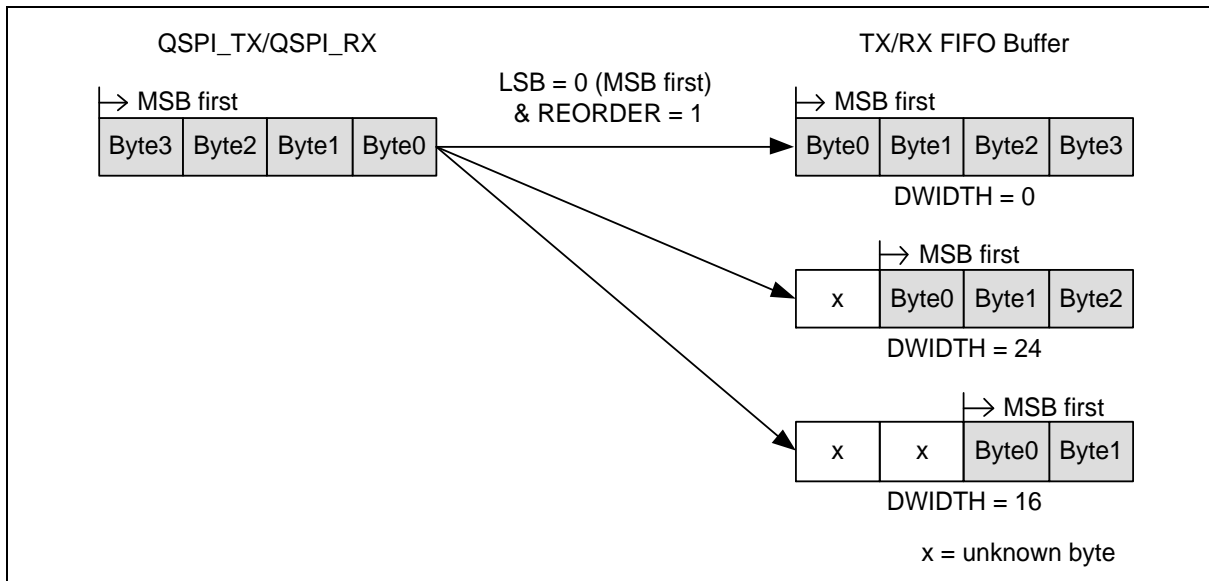

Figure 6.16-8 Byte Reorder Function

In Master mode, if REORDER (QSPIx_CTL[19]) is set to 1, a suspend interval of 0.5 ~ 15.5 QSPI clock periods will be inserted by hardware between two successive bytes in a transaction word. The suspend interval is configured in SUSPITV (QSPIx_CTL[7:4]).

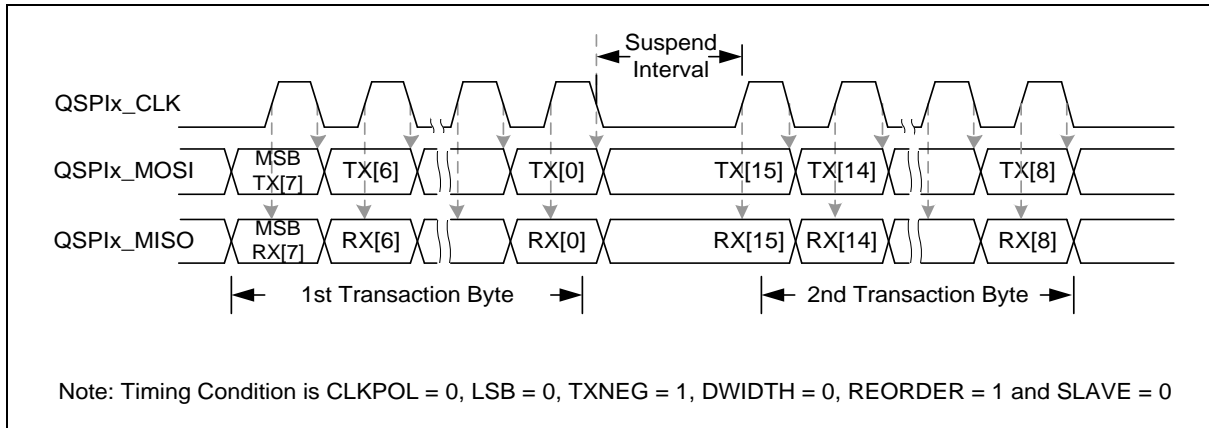

Figure 6.16-9 Timing Waveform for Byte Suspend

6.16.5.4 Half-Duplex Communication

The QSPI controller can communicate in half-duplex mode by setting HALFDPX (QSPIx_CTL[14]) bit. In half-duplex mode, there is only one data line for receiving or transmitting data direction which is defined by DATDIR (QSPIx_CTL[20]). In half-duplex configuration, the QSPIx_MISO pin is free for other applications and it can be configured as GPIO. Enabling or disabling the control bit HALFDPX (QSPIx_CTL[14]) will produce TXFBCLR (QSPIx_FIFCTL[9]) and RXFBCLR (QSPIx_FIFCTL[8]) at the same time automatically.

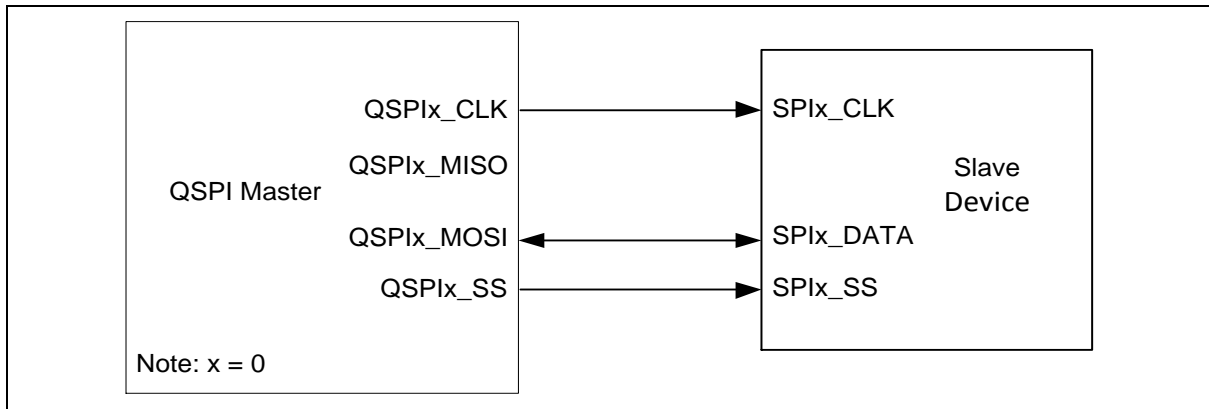

Figure 6.16-10 QSPI Half-Duplex Master Mode Application Block Diagram

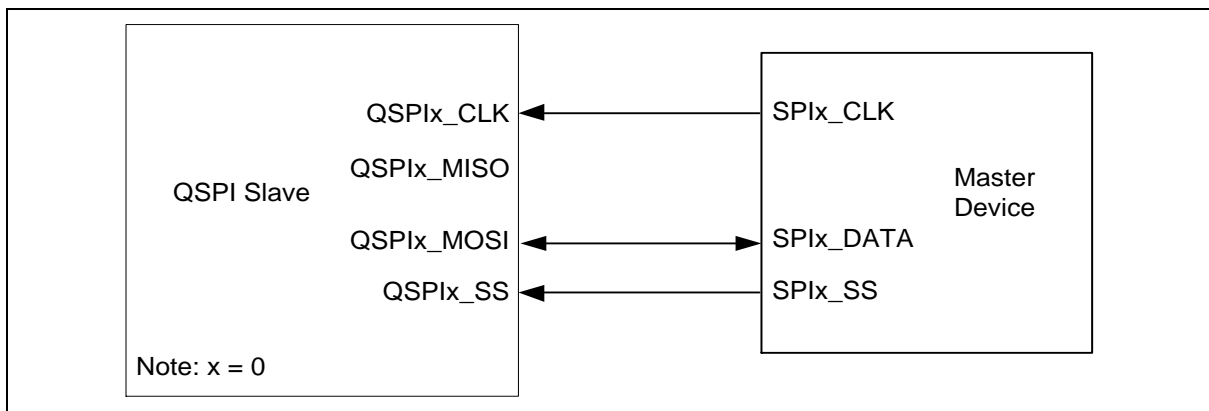

Figure 6.16-11 QSPI Half-Duplex Slave Mode Application Block Diagram

6.16.5.5 Receive-Only Mode

In QSPI Master device, it can communicate in receive-only mode by setting RXONLY (QSPiX_CTL[15]). In this configuration, the QSPI Master device will generate QSPI bus clock continuously as long as the receive-only mode is enabled for receiving data bit from SPI slave device. If AUTOSS (QSPiX_SSCTL[3]) is enabled in receive-only mode, QSPI Master will keep activating the slave select signal.

The remaining QSPiX_MOSI pin of QSPI Master device is not used for communication and can be configured as GPIO. The status BUSY (QSPiX_STATUS[0]) will be asserted in receive-only mode due to the generation of QSPI bus clock. Entering this mode will produce the TXFBCLR (QSPiX_FIFCTL[9]) and RXFBCLR (QSPiX_FIFCTL[8]) at the same time automatically. When user enables this mode, the output QSPI bus clock will be sent out after 6 peripheral clock cycles. In this mode, the data which has been written into transmit FIFO will be loaded into transmit shift register and sent out.

6.16.5.6 Slave 3-Wire Mode

When SLV3WIRE (QSPiX_SSCTL[4]) is set by software to enable the Slave 3-Wire mode, the QSPI controller can work with no slave selection signal in Slave mode. The SLV3WIRE (QSPiX_SSCTL[4]) only takes effect in Slave mode. Only three pins, QSPiX_CLK, QSPiX_MISO, and QSPiX_MOSI, are required to communicate with a SPI master. The QSPiX_SS pin can be configured as a GPIO. When the SLV3WIRE (QSPiX_SSCTL[4]) is set to 1, the QSPI slave will be ready to transmit/receive data after the SPIEN (QSPiX_CTL[0]) is set to 1.

6.16.5.7 PDMA Transfer Function

QSPI controller supports PDMA transfer function.

When TXPDMAEN (QSPiX_PDMACTL[0]) is set to 1, the controller will issue request to PDMA controller to start the PDMA transmission process automatically.

When RXPDMAEN (QSPiX_PDMACTL[1]) is set to 1, the controller will start the PDMA reception process. QSPI controller will issue request to PDMA controller automatically when there is data in the RX FIFO buffer.

When PDMA transfer is done, user needs to disable TXPDMAEN/RXPDMAEN. After re-setting control registers of PDMA, user enables TXPDMAEN/RXPDMAEN again.

Note: QSPI supports single request PDMA (Read/Write) only, burst request PDMA is not supported.

6.16.5.8 Two-bit Transfer Mode

The QSPI controller also supports 2-bit Transfer mode when setting TWOBIT (QSPiX_CTL[16]) to 1. In 2-bit Transfer mode, the QSPI controller performs full duplex data transfer. In other words, the two serial data bits can be transmitted and received simultaneously.

For example, in Master mode, the even data (TX Data (n)) stored in the QSPiX_TX register will be transmitted through the QSPiX_MOSI0 pin and the odd data (TX Data (n+1)) stored in the QSPiX_TX register will be transmitted through the QSPiX_MOSI1 pin respectively. In the meanwhile, the even data received from QSPiX_MISO0 pin will be written to RX FIFO prior to the odd data received from QSPiX_MISO1 pin.

In Slave mode, the even and odd data stored in the QSPiX_TX register will be transmitted through the QSPiX_MISO0 pin and QSPiX_MISO1 pin respectively. In the meanwhile, the QSPiX_RX register will store the even data received from the QSPiX_MOSI0 pin and the odd data from QSPiX_MOSI1 pin respectively. The data sequence of FIFO buffers is the same as the Master mode.

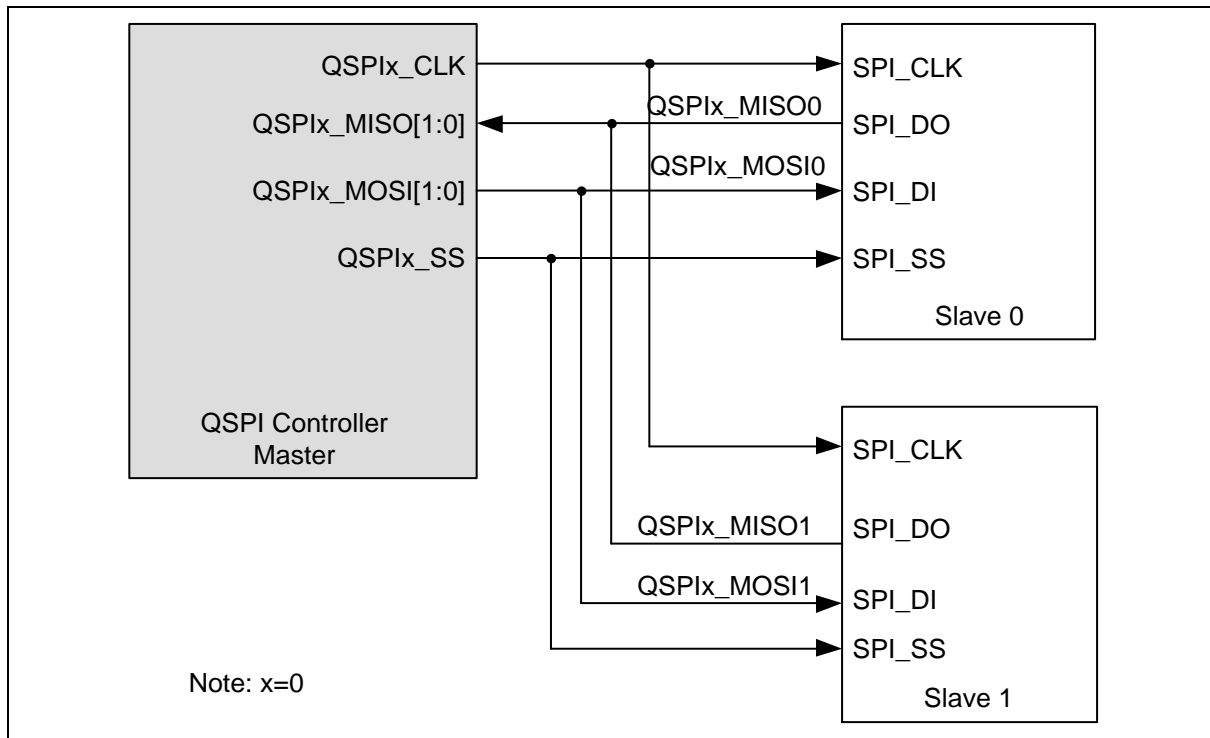

Figure 6.16-12 Two-bit Transfer Mode System Architecture

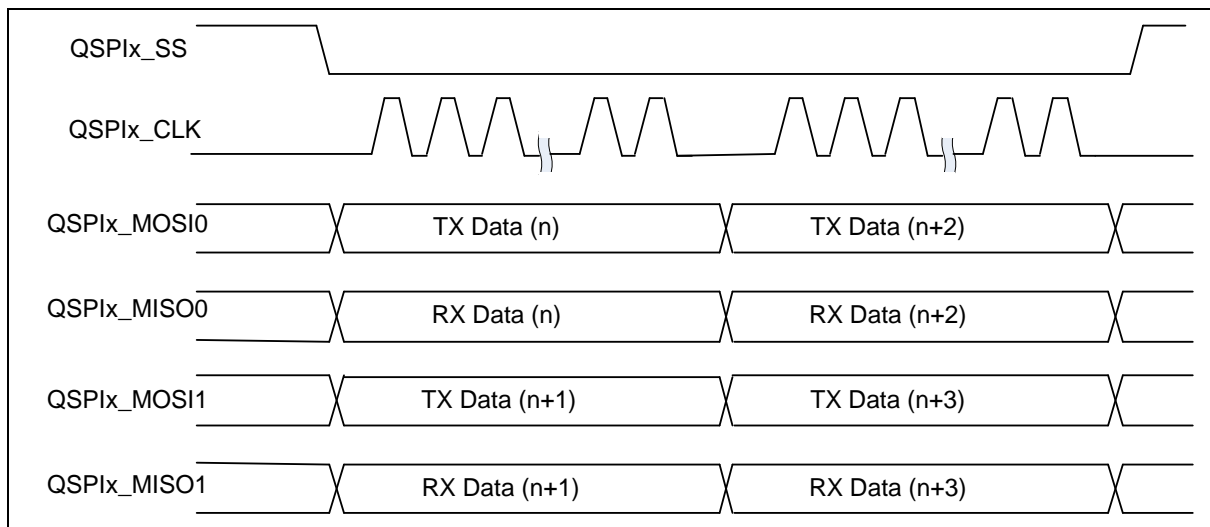

Figure 6.16-13 Two-bit Transfer Mode Timing (Master Mode)

6.16.5.9 Dual I/O Mode

The QSPI controller also supports Dual I/O transfer when setting the DUALIOEN ((QSPIx_CTL[21]) to 1. Many general SPI Flashes support Dual I/O transfer. The DATDIR (QSPIx_CTL[20]) is used to define the direction of the transfer data. When the DATDIR bit is set to 1, the controller will send the data to external device. When the DATDIR bit is set to 0, the controller will read the data from the external device. This function supports 8, 16, 24, and 32 bits of length.

The Dual I/O mode is not supported when the Slave 3-Wire mode or the Byte Reorder function is enabled.

For Dual I/O mode, if both the DUALIOEN (QSPIx_CTL[21]) and DATDIR (QSPIx_CTL[20]) are set as

1, the QSPi_x_MOSI₀ is the even bit data output and the QSPi_x_MISO₀ will be set as the odd bit data output. If the DUALIOEN (QSPi_x_CTL[21]) is set as 1 and DATDIR (QSPi_x_CTL[20]) is set as 0, both the QSPi_x_MISO₀ and QSPi_x_MOSI₀ will be set as data input ports.

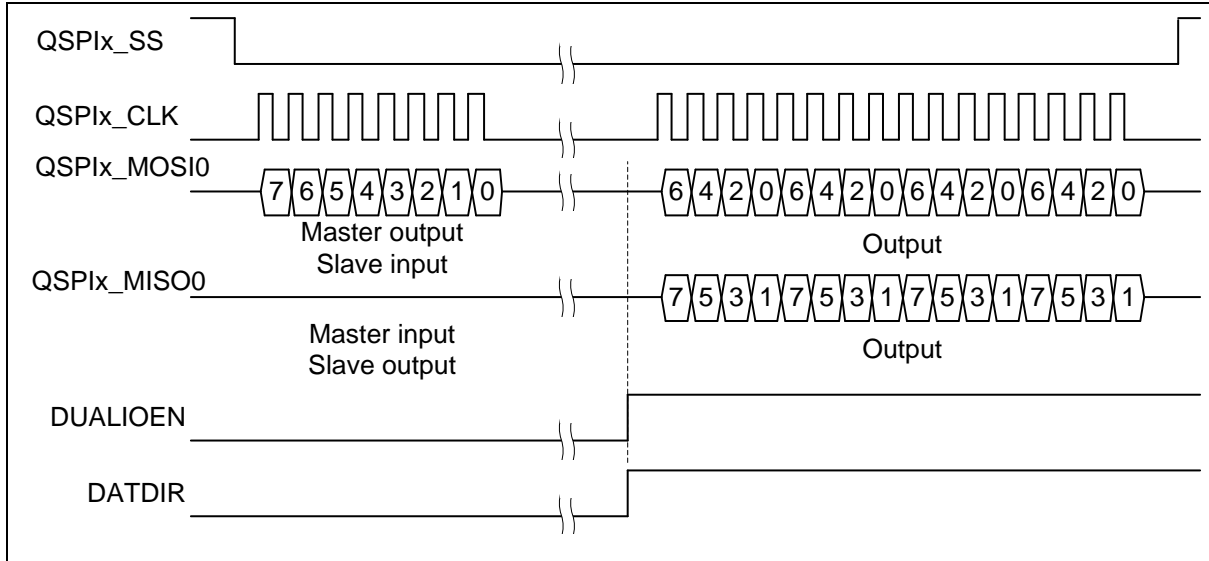

Figure 6.16-14 Bit Sequence of Dual Output Mode

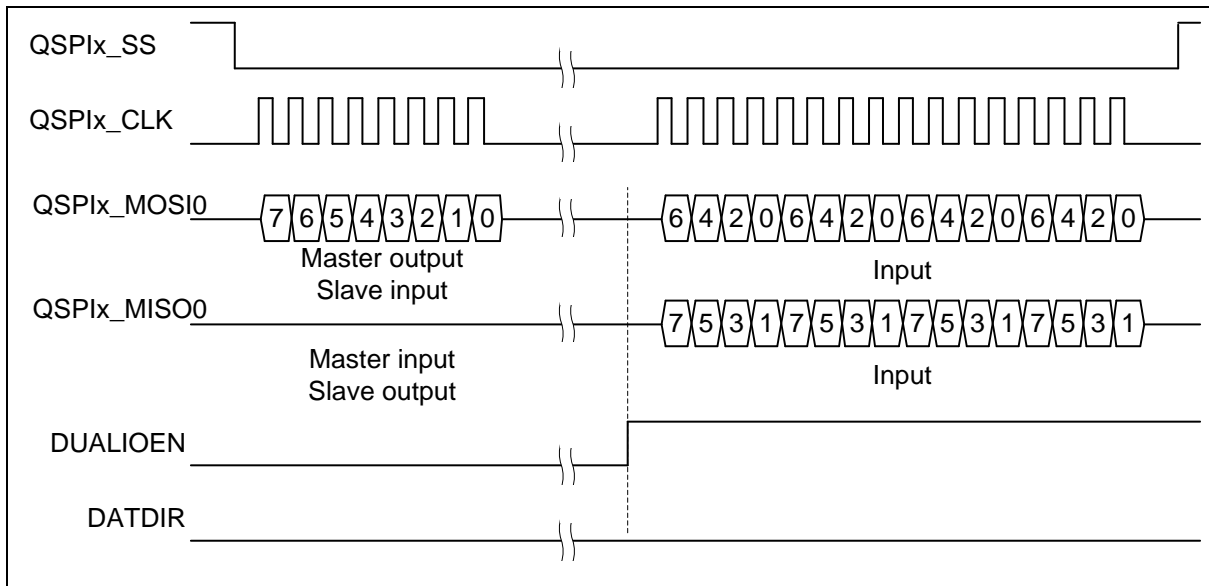

Figure 6.16-15 Bit Sequence of Dual Input Mode

6.16.5.10 Quad I/O Mode

The QSPI controller also supports Quad I/O transfer when setting the QUADIOEN (QSPi_x_CTL[22]) to 1. Many general SPI Flashes support Quad I/O transfer. The DATDIR bit (QSPi_x_CTL[20]) is used to define the direction of the transfer data. When the DATDIR (QSPi_x_CTL[20]) is set to 1, the controller will send the data to external device. When the DATDIR (QSPi_x_CTL[20]) is set to 0, the controller will read the data from the external device. This function supports 8, 16, 24, and 32 bits of length.

The Quad I/O mode is not supported when the Slave 3-Wire mode or the Byte Reorder function is enabled. The DUALIOEN (QSPi_x_CTL[21]) and QUADIOEN (QSPi_x_CTL[22]) shall not be set to 1 simultaneously.

For Quad I/O mode, if both the QUADIOEN (QSPIx_CTL[22]) and DATDIR (QSPIx_CTL[20]) are set as 1, the QSPIx_MOSI0 and QSPIx_MOSI1 are the even bit data output and the QSPIx_MISO0 and QSPIx_MISO1 will be set as the odd bit data output. If the QUADIOEN (QSPIx_CTL[22]) is set as 1 and DATDIR (QSPIx_CTL[20]) is set as 0, all the QSPIx_MISO0, QSPIx_MISO1, QSPIx_MOSI0 and QSPIx_MOSI1 pins will be set as data input ports.

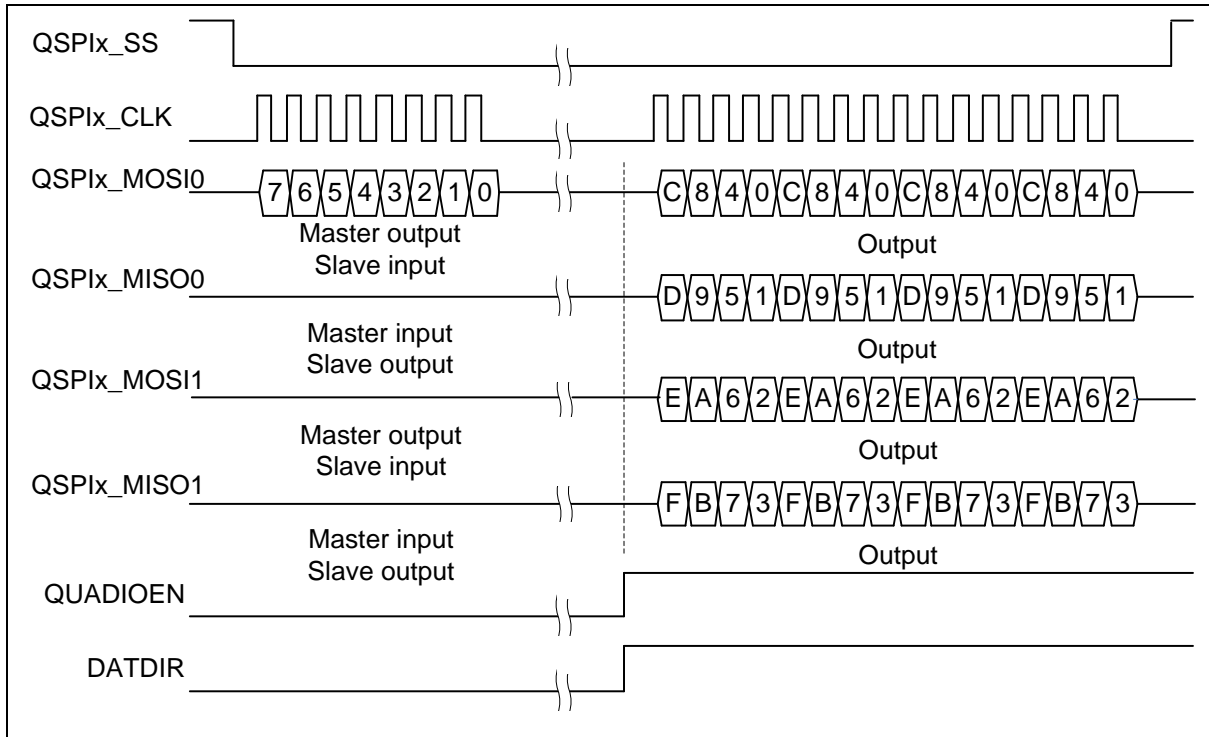

Figure 6.16-16 Bit Sequence of Quad Output Mode

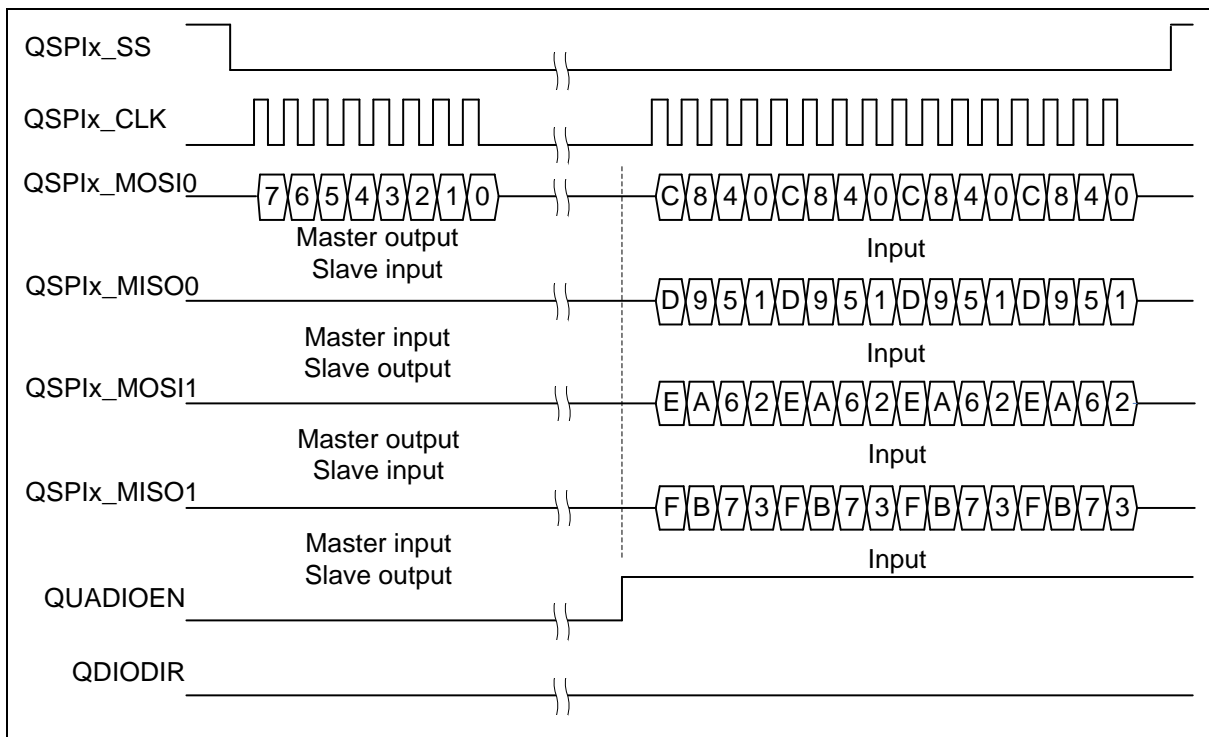

Figure 6.16-17 Bit Sequence of Quad Input Mode

6.16.5.11 FIFO Buffer Operation

The QSPI controller is equipped with eight 32-bit wide transmit and receive FIFO buffers. The data stored in the transmit FIFO buffer will be read and sent out by the transmission control logic. If the transmit FIFO buffer is full, the TXFULL (QSPIx_STATUS[17]) will be set to 1. When the QSPI transmission logic unit draws out the last datum of the transmit FIFO buffer, so that the transmit FIFO buffer is empty, the TXEMPTY (QSPIx_STATUS[16]) will be set to 1. Note that the TXEMPTY (QSPIx_STATUS[16]) flag is set to 1 while the last transaction is still in progress. In Master mode, the BUSY (QSPIx_STATUS[0]) is set to 1 when the FIFO buffer is written any data or there is any transaction on the QSPI bus. (e.g. the slave selection signal is active and the QSPI controller is receiving data in Slave mode). It will set to 0 when the transmit FIFO is empty and the current transaction has done. Thus, the status of BUSY (QSPIx_STATUS[0]) should be checked by software to make sure whether the QSPI is in idle or not.

The receive control logic will store the QSPI input data into the receive FIFO buffer. There are FIFO related status bits, like RXEMPTY (QSPIx_STATUS[8]) and RXFULL (QSPIx_STATUS[9]), to indicate the current status of RX FIFO buffer.

The transmitting and receiving threshold can be configured by setting TXTH (QSPIx_FIFCTL[30:28]) and RXTH (QSPIx_FIFCTL[26:24]). When the count of valid data stored in transmit FIFO buffer is less than or equal to TXTH (QSPIx_FIFCTL[30:28]) setting, TXTHIF (QSPIx_STATUS[18]) will be set to 1. When the count of valid data stored in receive FIFO buffer is larger than RXTH (QSPIx_FIFCTL[26:24]) setting, RXTHIF (QSPIx_STATUS[10]) will be set to 1.

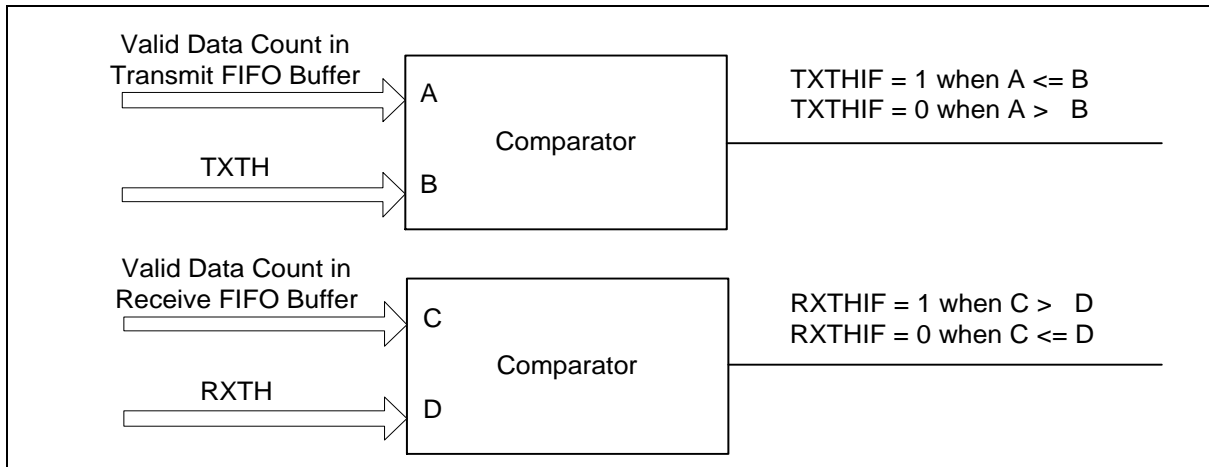

Figure 6.16-18 FIFO Threshold Comparator

In Master mode, when the first datum is written to the QSPIx_TX register, the TXEMPTY flag (QSPIx_STATUS[16]) will be cleared to 0. The transmission will start after 1 APB clock cycles and 6 peripheral clock cycles. User can write the next data into QSPIx_TX register immediately. The QSPI controller will insert a suspend interval between two successive transactions. The period of suspend interval is decided by the setting of SUSPITV (QSPIx_CTL[7:4]). If the SUSPITV (QSPIx_CTL[7:4]) equals 0, QSPI controller can perform continuous transfer. User can write data into QSPIx_TX register as long as the TXFULL (QSPIx_STATUS[17]) is 0.

In the example 1 of Figure 6.16-19, it indicates the updated condition of TXEMPTY (QSPIx_STATUS[16]) and the relationship among the FIFO buffer, shift register and the skew buffer. The TXEMPTY (QSPIx_STATUS[16]) is set to 0 when the Data0 is written into the FIFO buffer. The Data0 will be loaded into the shift register by the core logic and the TXEMPTY (QSPIx_STATUS[16]) will be to 1. The Data0 in shift register will be shift into skew buffer by bit for transmission until the transfer is done.

In the Example 2, it indicates the updated condition of TXFULL (QSPIx_STATUS[17]) when there are 8 data in the FIFO buffer and the next data of Data9 does not be written into the FIFO buffer when the TXFULL = 1.

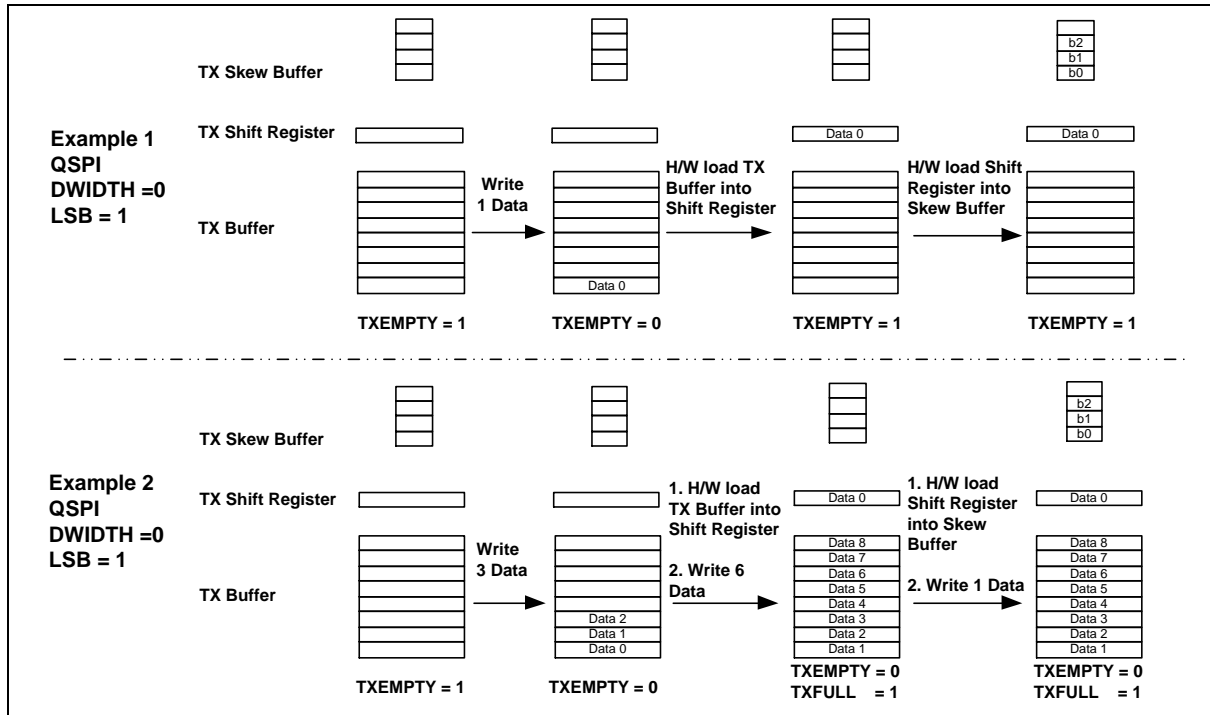

Figure 6.16-19 Transmit FIFO Buffer Example

The subsequent transactions will be triggered automatically if the transmitted data are updated in time. If the QSPIx_TX register does not be updated after all data transfer are done, the transfer will stop.

In Master mode, during receiving operation, the serial data are received from QSPIx_MISO pin and stored to receive FIFO buffer.

The received data (Data0's b0, b1, ...b31) is stored into skew buffer first according the serial clock (QSPIx_CLK) and then it is shift into the shift register bit by bit. The core logic will load the data in shift register into FIFO buffer when the received data bit count reach the value of DWIDTH (QSPIx_CTL[12:8]). The RXEMPTY (QSPIx_STATUS[8]) will be cleared to 0 while the receive FIFO buffer contains unread data (see the Example 1 of Receive FIFO Buffer Example). The received data can be read by software from QSPIx_RX register as long as the RXEMPTY (QSPIx_STATUS[8]) is 0. If the receive FIFO buffer contains 8 unread data, the RXFULL (QSPIx_STATUS[9]) will be set to 1 (see the Example 2 of Receive FIFO Buffer Example).

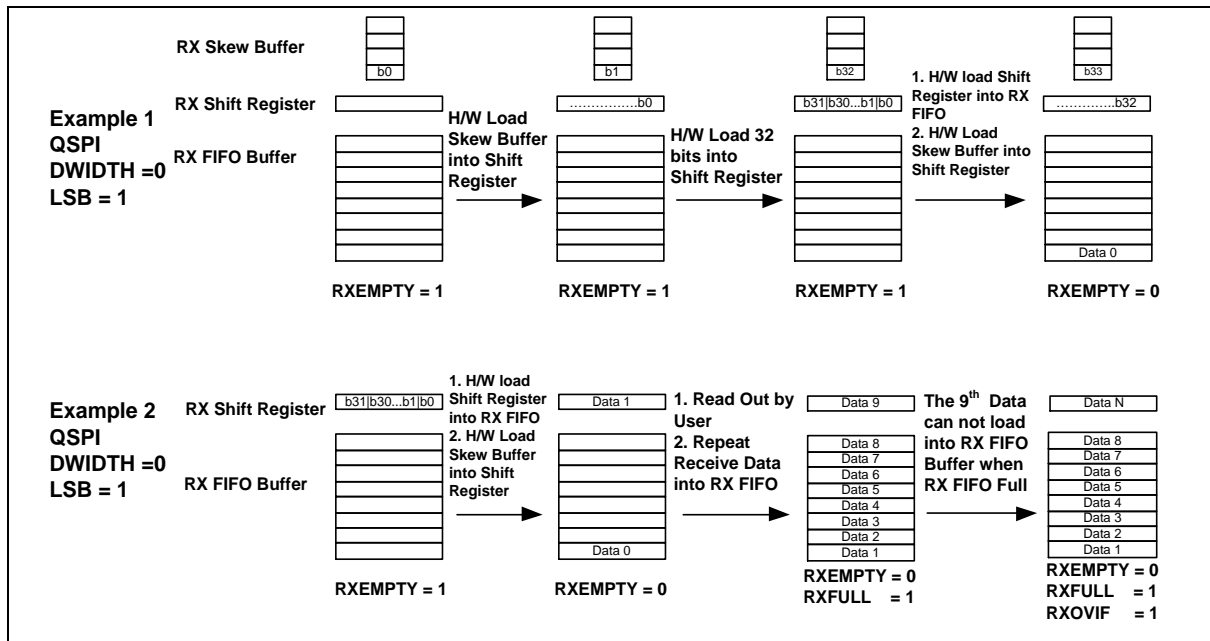

Figure 6.16-20 Receive FIFO Buffer Example

In Slave mode, during transmission operation, when data is written to the QSPiX_TX register by software, the data will be loaded into transmit FIFO buffer and the TXEMPTY (QSPiX_STATUS[16]) will be set to 0. The transmission will start when the slave device receives clock signal from master. Data can be written to QSPiX_TX register as long as the TXFULL (QSPiX_STATUS[17]) is 0. After all data have been drawn out by the QSPi transmission logic unit and the QSPiX_TX register is not updated by software, the TXEMPTY (QSPiX_STATUS[16]) will be set to 1.

If there is no any data written to the QSPiX_TX register, the transmit underflow interrupt flag, TXUFIF (QSPiX_STATUS[19]) will be set to 1 when the slave selection signal is active. The output data will be held by TXUFPOL (QSPiX_FIFCTL[6]) setting during this transfer until the slave selection signal goes to inactive state. When the transmit underflow event occurs, the slave under run interrupt flag, SLVURIF (QSPiX_STATUS[7]), will be set to 1 as QSPiX_SS goes to inactive state.

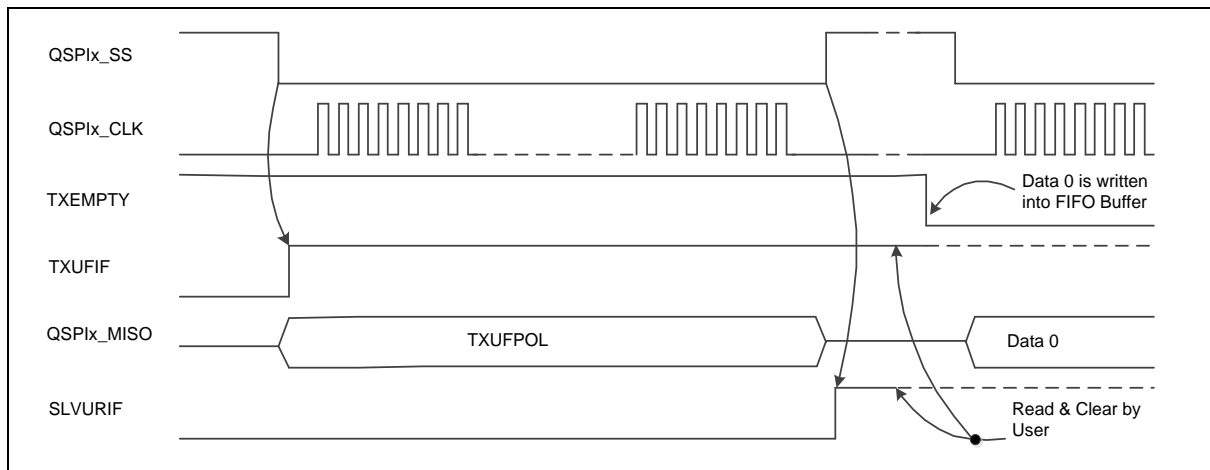

Figure 6.16-21 TX Underflow Event and Slave Under Run Event

In 2-bit Transfer mode, the transmit data is loaded into shift register after 2 datum have been written into the TX FIFO buffer. It uses two shift registers and two 4-level skew buffers concurrently. The detail timing of 2-bit Transfer mode, please refer to the section of Two-bit Transfer mode.

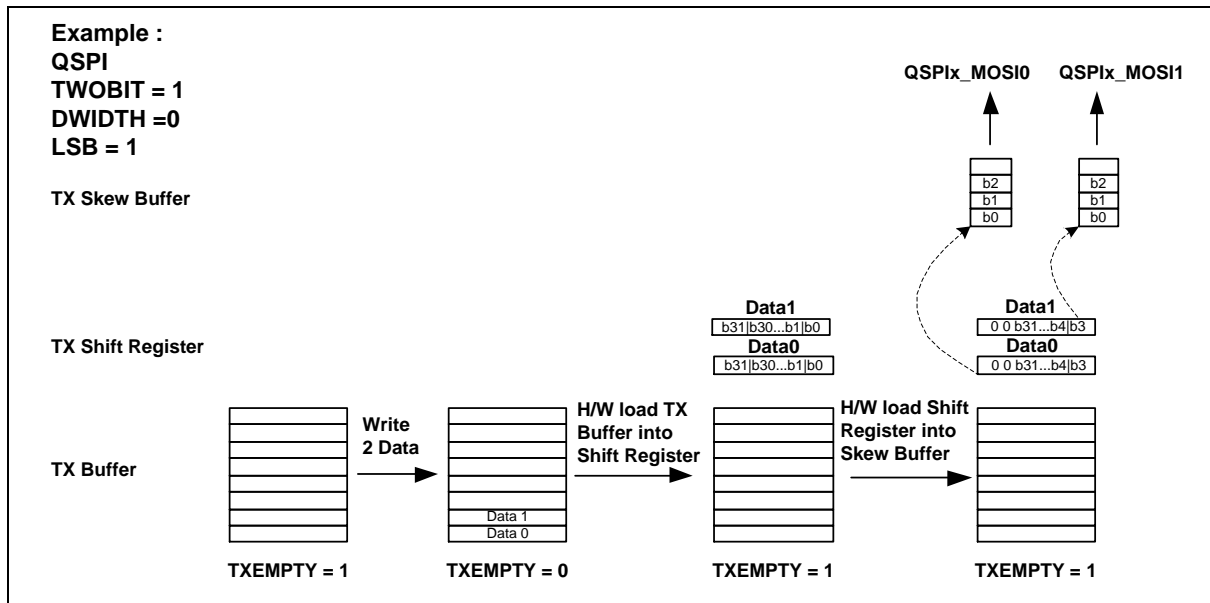

Figure 6.16-22 Two-bit Transfer Mode FIFO Buffer Example

In QSPI Slave 3-Wire mode, the first 2-bit data is un-predicted (keep on the level of last bit in previously transfer) if the data is written into TX FIFO among 3 peripheral clock cycles before the QSPI bus clock is presented. The other bits are held by TXUFPOL (QSPIx_FIFCTL[6]) because there is TX underflow event. The written data will be transmitted in the next transfer.

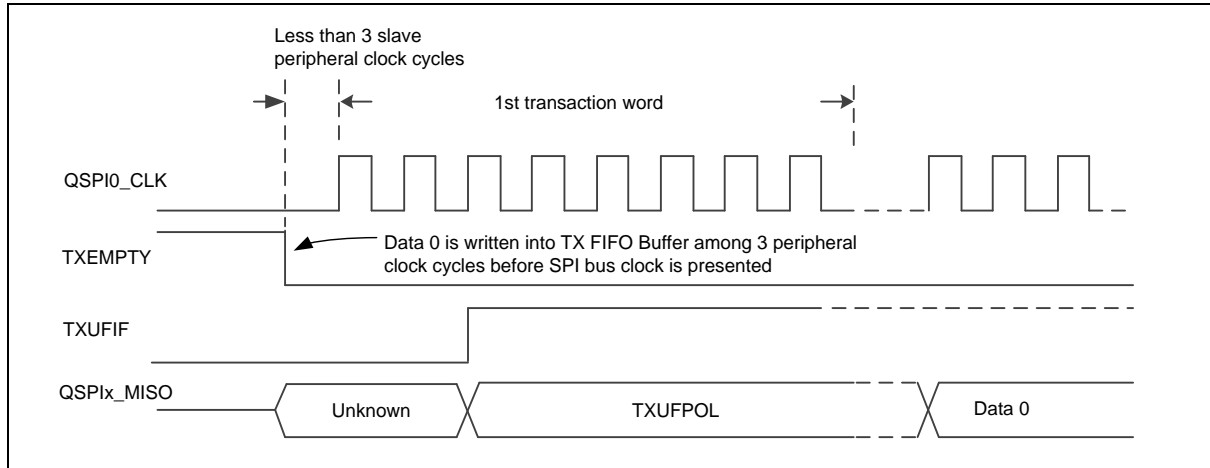

Figure 6.16-23 TX Underflow Event (QSPI0 Slave 3-Wire Mode Enabled)

In Slave mode, during receiving operation, the serial data is received from QSPIx_MOSI pin and stored to QSPIx_RX register. The reception mechanism is similar to Master mode reception operation. If the receive FIFO buffer contains 8 unread data, the RXFULL (QSPIx_STATUS[9]) will be set to 1 and the RXOVIF (QSPIx_STATUS[11]) will be set to 1 if there is more serial data received from QSPIx_MOSI and follow-up data will be dropped (refer to the Receive FIFO Buffer Example figure). If the receive bit count mismatch with the DWIDTH (QSPIx_CTL[12:8]) when the slave selection line goes to inactive state, the SLVBEIF (QSPIx_STATUS[6]) will be set to 1.

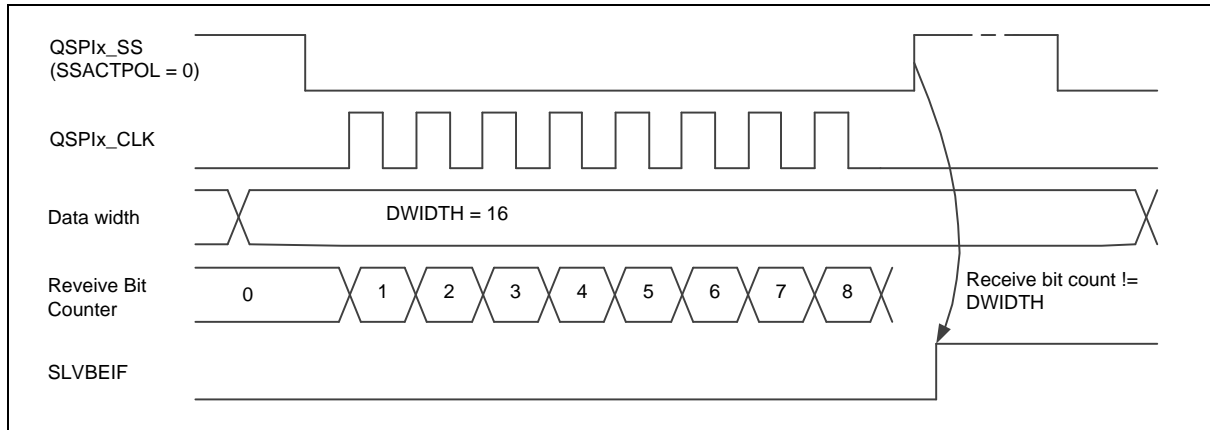

Figure 6.16-24 Slave Mode Bit Count Error

When the Slave select signal is active and the value of SLVTOCNT (QSPi_x_SSCTL[31:16]) is not 0, the Slave time-out counter in the QSPI controller logic will start after the serial clock input. This counter will be cleared after one transaction done or the SLVTOCNT is set to 0. If the value of the time-out counter is equal to the value of SLVTOCNT before one transaction done, the slave time-out event occurs and the SLVTOIF (QSPi_x_STATUS[5]) will be set to 1.

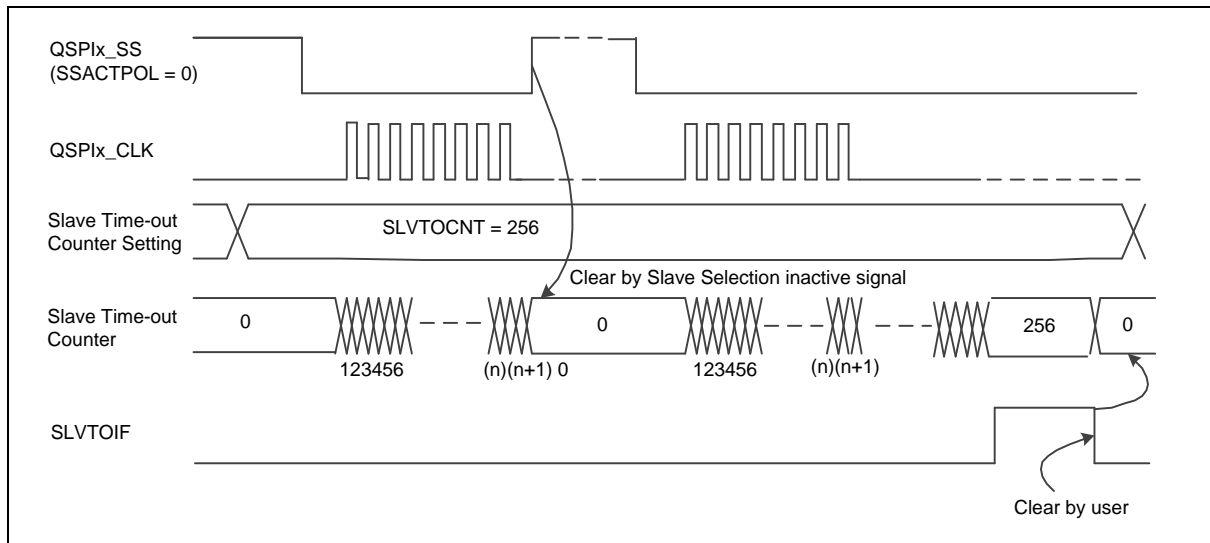

Figure 6.16-25 Slave Time-out Event

The QSPI controller has the receive time-out function. When the receive FIFO is not empty and no read operation in receive FIFO over 64 QSPI peripheral clock periods in Master mode or over 576 QSPI peripheral clock periods in Slave mode, the receive time-out occurs and the RXTOIF (QSPi_x_STATUS[12]) will be set to 1. When the receive FIFO is read by user, the time-out status will be cleared automatically.

6.16.5.12 Interrupt

- QSPI unit transfer interrupt

As the QSPI controller finishes a unit transfer, the unit transfer interrupt flag UNITIF (QSPi_x_STATUS[1]) will be set to 1. The unit transfer interrupt event will generate an interrupt to CPU if the unit transfer interrupt enable bit UNITIEN (QSPi_x_CTL[17]) is set. The unit transfer interrupt flag can be cleared only by writing 1 to it.

- QSPI slave selection active/inactive interrupt

In Slave mode, the slave selection active/inactive interrupt flag, SSACTIF (QSPiX_STATUS[2]) and SSINAIF (QSPiX_STATUS[3]), will be set to 1 when the SPIEN (QSPiX_CTL[0]) and SLAVE (QSPiX_CTL[18]) are set to 1 and the slave selection signal goes to active/inactive state. The QSPI controller will issue an interrupt if the SSINAIF (QSPiX_SSCTL[13]) or SSACTIEN (QSPiX_SSCTL[12]), are set to 1.

- Slave time-out interrupt

In Slave mode, there is slave time-out function for user to know that there is serial clock input but one transaction is not finished over the period of SLVTOCNT (QSPiX_SSCTL[31:16]) basing on Slave peripheral clock.

When the slave selection signal is active and the value of SLVTOCNT (QSPiX_SSCTL[31:16]) is not 0, the slave time-out counter in the QSPI controller logic will start after the serial clock input. This counter will be cleared after one transaction done or the SLVTOCNT (QSPiX_SSCTL[31:16]) is set to 0. If the value of the time-out counter is greater than or equal to the value of SLVTOCNT (QSPiX_SSCTL[31:16]) before one transaction done, the slave time-out event occurs and the SLVTOIF (QSPiX_STATUS[5]) will be set to 1. The QSPI controller will issue an interrupt if the SLVTOIEN (QSPiX_SSCTL[5]) is set to 1.

- Slave bit count error interrupt

In Slave mode, if the transmit/receive bit count mismatch with the DWIDTH (QSPiX_CTL[12:8]) when the slave selection line goes to inactive state, the SLVBEIF (QSPiX_STATUS[6]) will be set to 1. The uncompleted transaction will be dropped from TX and RX shift registers. The QSPI controller will issue an interrupt if the SLVBEIEN (QSPiX_SSCTL[8]) is set to 1.

Note: If the slave selection signal is active but there is no any serial clock input, the SLVBEIF (QSPiX_STATUS[6]) will be set to 1 when the slave selection signal goes to inactive state.

- TX underflow interrupt

In QSPI Slave mode, if there is no any data is written to the QSPiX_TX register, the TXUFIF (QSPiX_STATUS[19]) will be set to 1 when the slave selection signal is active. The QSPI controller will issue a TX underflow interrupt if the TXUFIEN (QSPiX_FIFOCTL[7]) is set to 1.

Note: If underflow event occurs in QSPI Slave mode, there are two conditions which make QSPI Slave mode return to idle state and then goes for next transfer: (1) set TXRST to 1 (2) slave select signal is changed to inactive state while SLV3WIRE=0.

- Slave TX under run interrupt

If the TX underflow event occurs, the SLVURIF (QSPiX_STATUS[7]) will be set to 1 when QSPiX_SS goes to inactive state. The QSPI controller will issue a TX under run interrupt if the SLVURIEN (QSPiX_SSCTL[9]) is set to 1.

Note: In Slave 3-Wire mode, the slave selection signal is considered active all the time so that user shall poll the TXUFIF (QSPiX_STATUS[19]) to know if there is TX underflow event or not.

- Receive Overrun interrupt

In Slave mode, if the receive FIFO buffer contains 8 unread data, the RXFULL (QSPiX_STATUS[9]) will be set to 1 and the RXOVIF (QSPiX_STATUS[11]) will be set to 1 if there is more serial data is received from QSPI bus and follow-up data will be dropped. The QSPI controller will issue an interrupt if the RXOVIEN (QSPiX_FIFOCTL[5]) is set to 1.

- Receive FIFO time-out interrupt

If there is a received data in the FIFO buffer and it is not read by software over 64 QSPI

peripheral clock periods in Master mode or over 576 QSPI peripheral clock periods in Slave mode, it will send a RX time-out interrupt to the system if the RX time-out interrupt enable bit, RXTOIEN (QSPIx_FIFCTL[4]), is set to 1.

- Transmit FIFO interrupt

In FIFO mode, if the valid data count of the transmit FIFO buffer is less than or equal to the setting value of TXTH (QSPIx_FIFCTL[30:28]), the transmit FIFO interrupt flag TXTHIF (QSPIx_STATUS[18]) will be set to 1. The QSPI controller will generate a transmit FIFO interrupt to the system if the transmit FIFO interrupt enable bit, TXTHIEN (QSPIx_FIFCTL[3]), is set to 1.

- Receive FIFO interrupt

In FIFO mode, if the valid data count of the receive FIFO buffer is larger than the setting value of RXTH (QSPIx_FIFCTL[26:24]), the receive FIFO interrupt flag RXTHIF (QSPIx_STATUS[10]) will be set to 1. The QSPI controller will generate a receive FIFO interrupt to the system if the receive FIFO interrupt enable bit, RXTHIEN (QSPIx_FIFCTL[2]), is set to 1.

6.16.6 Timing Diagram

The active state of slave selection signal can be defined by setting the SSACTPOL (QSPIx_SSCTL[2]). The QSPI clock which is in idle state can be configured as high or low state by setting the CLKPOL (QSPIx_CTL[3]). It also provides the bit length of a transaction word in DWIDTH (QSPIx_CTL[12:8]), and transmitting/receiving data from MSB or LSB first in LSB (QSPIx_CTL[13]). User can also select which edge of QSPI clock to transmit/receive data in TXNEG/RXNEG (QSPIx_CTL[2:1]). Four QSPI timing diagrams for master/slave operations and the related settings are shown below.

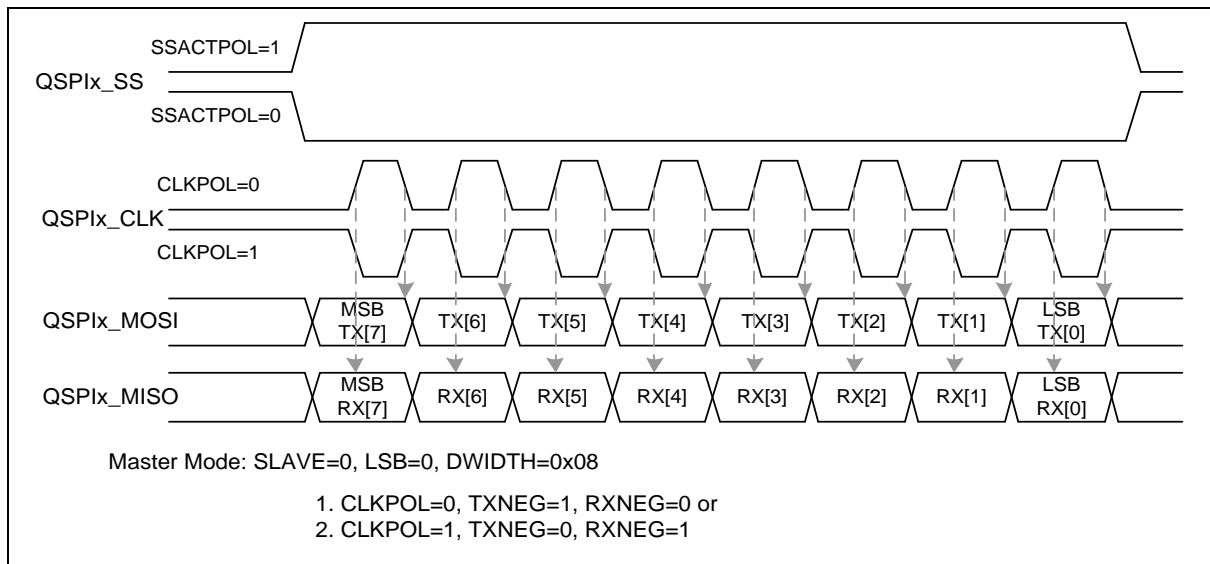

Figure 6.16-26 QSPI Timing in Master Mode

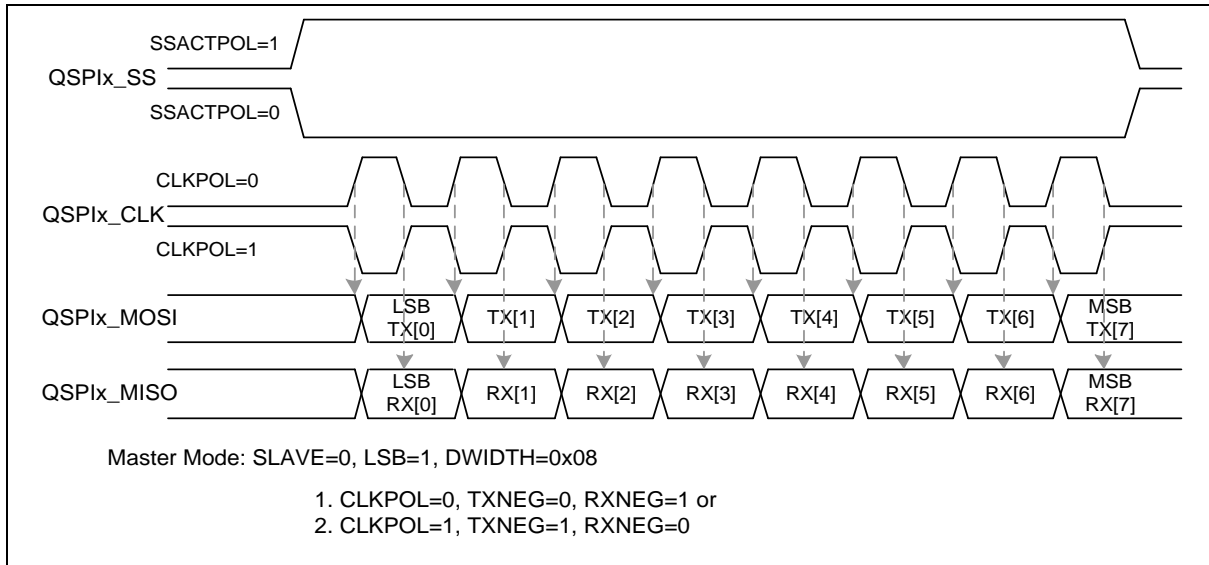

Figure 6.16-27 QSPI Timing in Master Mode (Alternate Phase of QSPiX_CLK)

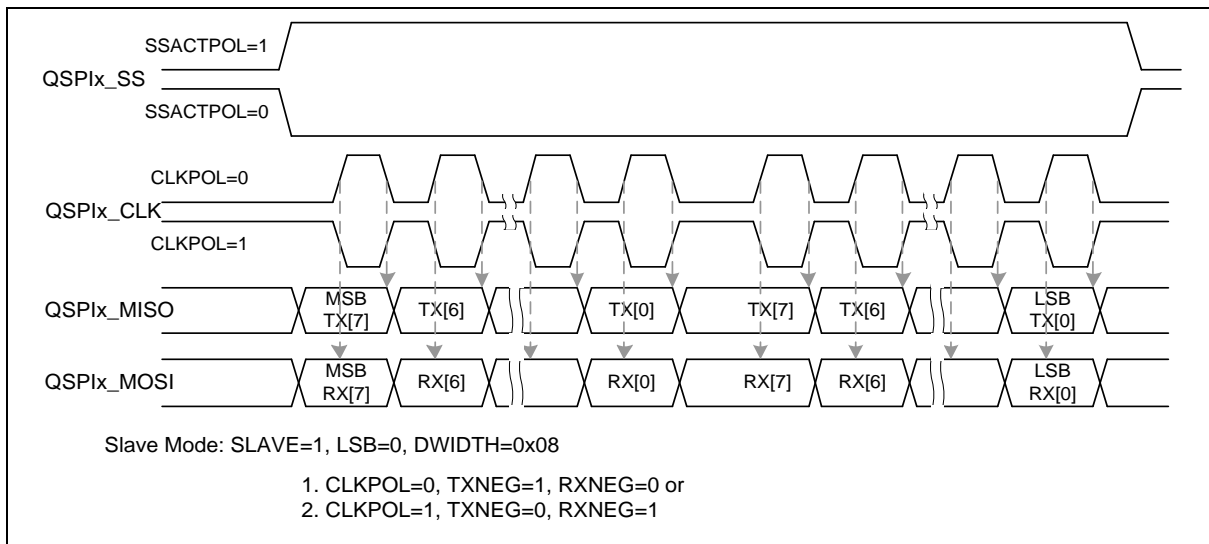

Figure 6.16-28 QSPI Timing in Slave Mode

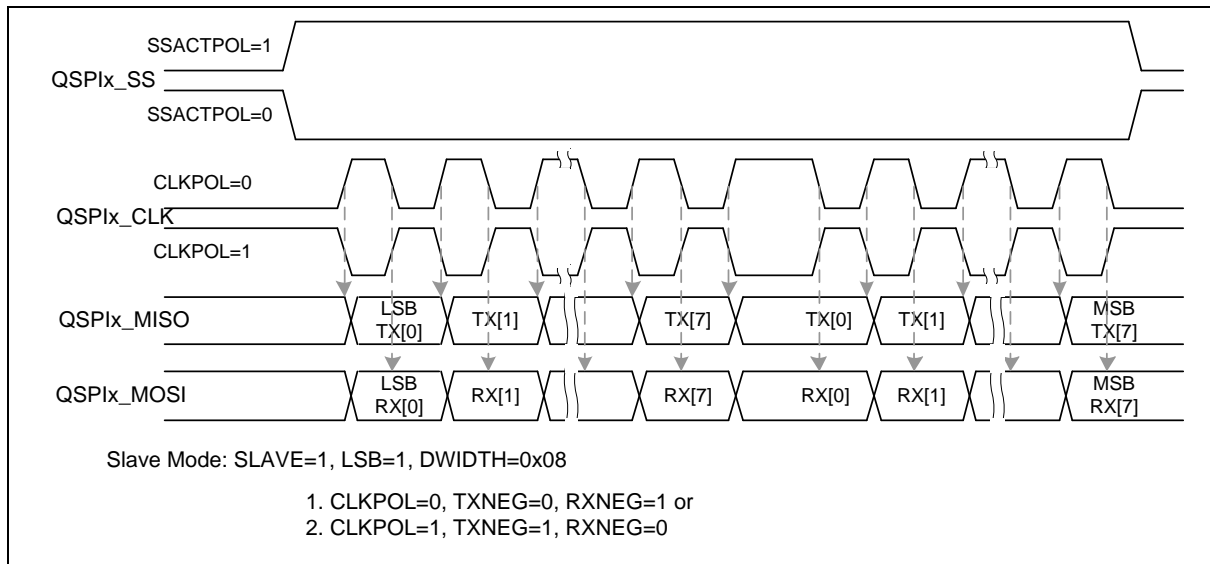

Figure 6.16-29 QSPI Timing in Slave Mode (Alternate Phase of QSPiX_CLK)

6.16.7 Programming Examples

Example 1:

The QSPI controller is set as a full-duplex master to access an off-chip slave device with the following specifications:

- Data bit is latched on positive edge of QSPI bus clock.
- Data bit is driven on negative edge of QSPI bus clock.
- Data is transferred from MSB first.
- QSPI bus clock is idle at low state.
- Only one byte of data to be transmitted/received in a transaction.
- Uses the first QSPI slave select pin to connect with an off-chip slave device. The slave selection signal is active low.

The operation flow is as follows:

1. Set DIVIDER (QSPiX_CLKDIV [8:0]) to determine the output frequency of QSPI clock.
2. Write the QSPiX_SSCTL register a proper value for the related settings of Master mode:
 - 1) Clear AUTOSS (QSPiX_SSCTL[3]) to 0 to disable the Automatic Slave Selection function.
 - 2) Configure slave selection signal as active low by clearing SSACTPOL (QSPiX_SSCTL[2]) to 0.
 - 3) Enable slave selection signal by setting SS (QSPiX_SSCTL[0]) to 1 to activate the off-chip slave device.
3. Write the related settings into the QSPiX_CTL register to control the QSPI master actions.
 - 1) Configure this QSPI controller as master device by setting SLAVE (QSPiX_CTL[18]) to 0.
 - 2) Force the QSPI clock idle state at low by clearing CLKPOL (QSPiX_CTL[3]) to 0.
 - 3) Select data transmitted on negative edge of QSPI bus clock by setting TXNEG (QSPiX_CTL[2]) to 1.
 - 4) Select data latched on positive edge of QSPI bus clock by clearing RXNEG

- (QSPiX_CTL[1]) to 0.
- 5) Set the bit length of a transaction as 8-bit in DWIDTH bit field (QSPiX_CTL[12:8] = 0x08).
 - 6) Set MSB transfer first by clearing LSB (QSPiX_CTL[13]) to 0.
4. Set SPIEN (QSPiX_CTL[0]) to 1 to enable the data transfer with the QSPI interface.
 5. If this QSPI master attempts to transmit (write) one byte data to the off-chip slave device, write the byte data that will be transmitted into the QSPiX_TX register.
 6. Waiting for QSPI interrupt if the UNITIEN (QSPiX_CTL[17]) is set to 1, or just polling the unit transfer interrupt flag UNITIF (QSPiX_STATUS[1]).
 7. Read out the received one byte data from QSPiX_RX register.
 8. Go to 5) to continue another data transfer or set SS (QSPiX_SSCTL[0]) to 0 to inactivate the off-chip slave device.

Example 2:

The QSPI controller is set as a full-duplex slave device and connects with an off-chip master device. The off-chip master device communicates with the on-chip QSPI slave controller through the QSPI interface with the following specifications:

- Data bit is latched on positive edge of QSPI bus clock.
- Data bit is driven on negative edge of QSPI bus clock.
- Data is transferred from LSB first.
- QSPI bus clock is idle at high state.
- Only one byte of data to be transmitted/received in a transaction.
- Slave selection signal is active high.

The operation flow is as follows:

1. Write the QSPiX_SSCTL register a proper value for the related settings of Slave mode.
2. Select high level for the input of slave selection signal by setting SSACTPOL (QSPiX_SSCTL[2]) to 1.
3. Write the related settings into the QSPiX_CTL register to control this QSPI slave actions
 - 1) Set the QSPI controller as slave device by setting SLAVE (QSPiX_CTL[18]) to 1.
 - 2) Select the QSPI clock idle state at high by setting CLKPOL (QSPiX_CTL[3]) to 1.
 - 3) Select data transmitted on negative edge of QSPI bus clock by setting TXNEG (QSPiX_CTL[2]) to 1.
 - 4) Select data latched on positive edge of QSPI bus clock by clearing RXNEG (QSPiX_CTL[1]) to 0.
 - 5) Set the bit length of a transaction as 8-bit in DWIDTH bit field (QSPiX_CTL[12:8] = 0x08).
4. Set LSB transfer first by setting LSB (QSPiX_CTL[13]) to 1.
5. Set the SPIEN (QSPiX_CTL[0]) to 1. Wait for the slave select trigger input and QSPI clock input from the off-chip master device to start the data transfer.
6. If this QSPI slave attempts to transmit (be read) one byte data to the off-chip master device, write the byte data that will be transmitted into the QSPiX_TX register.
7. If this QSPI slave just only attempts to receive (be written) one byte data from the off-chip master device and does not care what data will be transmitted, the QSPiX_TX register does not need to be updated by software.

8. Waiting for QSPI interrupt if the UNITIEN (QSPiX_CTL[17]) is set to 1, or just polling the unit transfer interrupt flag UNITIF (QSPiX_STATUS[1]).
9. Read out the received one byte data from QSPiX_RX register.
10. Go to 7 to continue another data transfer or stop data transfer.

6.16.8 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
QSPI Base Address: QSPIx_BA = 0x4006_0000 x=0				
QSPIx_CTL	QSPIx_BA+0x00	R/W	QSPI Control Register	0x0000_0034
QSPIx_CLKDIV	QSPIx_BA+0x04	R/W	QSPI Clock Divider Register	0x0000_0000

QSPIx_RX	QSPIx_BA+0x30	R	QSPI Data Receive Register	0x0000_0000

6.16.9 Register Description

QSPI Control Register (QSPIx_CTL)

Register	Offset	R/W	Description	Reset Value
QSPIx_CTL	QSPIx_BA+0x00	R/W	QSPI Control Register	0x0000_0034

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved	QUADIOEN	DUALIOEN	DATDIR	REORDER	SLAVE	UNITIEN	TWOBIT
15	14	13	12	11	10	9	8
RXONLY	HALFDPX	LSB	DWIDTH				
7	6	5	4	3	2	1	0
SUSPITV				CLKPOL	TXNEG	RXNEG	SPIEN

Bits	Description	
[31:23]	Reserved	Reserved.
[22]	QUADIOEN	Quad I/O Mode Enable Bit 0 = Quad I/O mode Disabled. 1 = Quad I/O mode Enabled.
[21]	DUALIOEN	Dual I/O Mode Enable Bit 0 = Dual I/O mode Disabled. 1 = Dual I/O mode Enabled.
[20]	DATDIR	Data Port Direction Control This bit is used to select the data input/output direction in half-duplex transfer and Dual/Quad transfer 0 = QSPI data is input direction. 1 = QSPI data is output direction.
[19]	REORDER	Byte Reorder Function Enable Bit 0 = Byte Reorder function Disabled. 1 = Byte Reorder function Enabled. A byte suspend interval will be inserted among each byte. The period of the byte suspend interval depends on the setting of SUSPITV. Note: Byte Reorder function is only available if DWIDTH is defined as 16, 24, and 32 bits.
[18]	SLAVE	Slave Mode Control 0 = Master mode. 1 = Slave mode.
[17]	UNITIEN	Unit Transfer Interrupt Enable Bit 0 = QSPI unit transfer interrupt Disabled. 1 = QSPI unit transfer interrupt Enabled.
[16]	TWOBIT	2-bit Transfer Mode Enable Bit 0 = 2-bit Transfer mode Disabled.

		<p>1 = 2-bit Transfer mode Enabled.</p> <p>Note: When 2-bit Transfer mode is enabled, the first serial transmitted bit data is from the first FIFO buffer data, and the 2nd serial transmitted bit data is from the second FIFO buffer data. As the same as transmitted function, the first received bit data is stored into the first FIFO buffer and the 2nd received bit data is stored into the second FIFO buffer at the same time.</p>
[15]	RXONLY	<p>Receive-only Mode Enable Bit (Master Only)</p> <p>This bit field is only available in Master mode. In receive-only mode, QSPI Master will generate QSPI bus clock continuously for receiving data bit from SPI slave device and assert the BUSY status.</p> <p>0 = Receive-only mode Disabled.</p> <p>1 = Receive-only mode Enabled.</p>
[14]	HALFDPX	<p>QSPI Half-duplex Transfer Enable Bit</p> <p>This bit is used to select full-duplex or half-duplex for QSPI transfer. The bit field DATDIR (QSPiX_CTL[20]) can be used to set the data direction in half-duplex transfer.</p> <p>0 = QSPI operates in full-duplex transfer.</p> <p>1 = QSPI operates in half-duplex transfer.</p>
[13]	LSB	<p>Send LSB First</p> <p>0 = The MSB, which bit of transmit/receive register depends on the setting of DWIDTH, is transmitted/received first.</p> <p>1 = The LSB, bit 0 of the QSPiX TX register, is sent first to the QSPI data output pin, and the first bit received from the QSPI data input pin will be put in the LSB position of the RX register (bit 0 of QSPiX_RX).</p>
[12:8]	DWIDTH	<p>Data Width</p> <p>This field specifies how many bits can be transmitted / received in one transaction. The minimum bit length is 8 bits and can up to 32 bits.</p> <p>DWIDTH = 0x08 8 bits.</p> <p>DWIDTH = 0x09 9 bits.</p> <p>.....</p> <p>DWIDTH = 0x1F 31 bits.</p> <p>DWIDTH = 0x00 32 bits.</p>
[7:4]	SUSPITV	<p>Suspend Interval (Master Only)</p> <p>The four bits provide configurable suspend interval between two successive transmit/receive transaction in a transfer. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value is 0x3. The period of the suspend interval is obtained according to the following equation.</p> <p>$(SUSPITV + 0.5) * \text{period of QSPICLK clock cycle}$</p> <p>Example:</p> <p>SUSPITV = 0x0 0.5 QSPICLK clock cycle.</p> <p>SUSPITV = 0x1 1.5 QSPICLK clock cycle.</p> <p>.....</p> <p>SUSPITV = 0xE 14.5 QSPICLK clock cycle.</p> <p>SUSPITV = 0xF 15.5 QSPICLK clock cycle.</p>
[3]	CLKPOL	<p>Clock Polarity</p> <p>0 = QSPI bus clock is idle low.</p> <p>1 = QSPI bus clock is idle high.</p>
[2]	TXNEG	<p>Transmit on Negative Edge</p> <p>0 = Transmitted data output signal is changed on the rising edge of QSPI bus clock.</p> <p>1 = Transmitted data output signal is changed on the falling edge of QSPI bus clock.</p>

[1]	RXNEG	<p>Receive on Negative Edge</p> <p>0 = Received data input signal is latched on the rising edge of QSPI bus clock. 1 = Received data input signal is latched on the falling edge of QSPI bus clock.</p>
[0]	SPIEN	<p>QSPI Transfer Control Enable Bit</p> <p>In Master mode, the transfer will start when there is data in the FIFO buffer after this bit is set to 1. In Slave mode, this device is ready to receive data when this bit is set to 1.</p> <p>0 = Transfer control Disabled. 1 = Transfer control Enabled.</p> <p>Note: Before changing the configurations of QSPiX_CTL, QSPiX_CLKDIV, QSPiX_SSCTL and QSPiX_FIFCTL registers, user shall clear the SPIEN (QSPiX_CTL[0]) and confirm the SPIENSTS (QSPiX_STATUS[15]) is 0.</p>

QSPI Clock Divider Register (QSPiX_CLKDIV)

Register	Offset	R/W	Description	Reset Value
QSPiX_CLKDIV	QSPiX_BA+0x04	R/W	QSPI Clock Divider Register	0x0000_0000

Bits	Description	
[31:28]	TXCNT	Transmit FIFO Data Count (Read Only) This bit field indicates the valid data count of transmit FIFO buffer.
[27:24]	RXCNT	Receive FIFO Data Count (Read Only) This bit field indicates the valid data count of receive FIFO buffer.
[23]	TXRXRST	TX or RX Reset Status (Read Only) 0 = The reset function of TXRST or RXRST is done. 1 = Doing the reset function of TXRST or RXRST. Note: Both the reset operations of TXRST and RXRST need 3 system clock cycles + 2 peripheral clock cycles. User can check the status of this bit to monitor the reset function is doing or done.
[22:20]	Reserved	Reserved.
[19]	TXUFIF	TX Underflow Interrupt Flag When the TX underflow event occurs, this bit will be set to 1, the state of data output pin depends on the setting of TXUFPOL. 0 = No effect. 1 = No data in Transmit FIFO and TX shift register when the slave selection signal is active. Note 1: This bit will be cleared by writing 1 to it. Note 2: If reset slave's transmission circuit when slave selection signal is active, this flag will be set to 1 after 2 peripheral clock cycles + 3 system clock cycles since the reset operation is done.
[18]	TXTHIF	Transmit FIFO Threshold Interrupt Flag (Read Only) 0 = The valid data count within the transmit FIFO buffer is larger than the setting value of TXTH. 1 = The valid data count within the transmit FIFO buffer is less than or equal to the setting value of TXTH.
[17]	TXFULL	Transmit FIFO Buffer Full Indicator (Read Only) 0 = Transmit FIFO buffer is not full.

		1 = Transmit FIFO buffer is full.
[16]	TXEMPTY	Transmit FIFO Buffer Empty Indicator (Read Only) 0 = Transmit FIFO buffer is not empty. 1 = Transmit FIFO buffer is empty.
[15]	SPIENSTS	QSPI Enable Status (Read Only) 0 = QSPI controller Disabled. 1 = QSPI controller Enabled. Note: The QSPI peripheral clock is asynchronous with the system clock. In order to make sure the QSPI control logic is disabled, this bit indicates the real status of QSPI controller.
[14:13]	Reserved	Reserved.
[12]	RXTOIF	Receive Time-out Interrupt Flag 0 = No receive FIFO time-out event. 1 = Receive FIFO buffer is not empty and no read operation on receive FIFO buffer over 64 QSPI peripheral clock periods in Master mode or over 576 QSPI peripheral clock periods in Slave mode. When the received FIFO buffer is read by software, the time-out status will be cleared automatically. Note: This bit will be cleared by writing 1 to it.
[11]	RXOVIF	Receive FIFO Overrun Interrupt Flag When the receive FIFO buffer is full, the follow-up data will be dropped and this bit will be set to 1. 0 = No FIFO is overrun. 1 = Receive FIFO is overrun. Note: This bit will be cleared by writing 1 to it.
[10]	RXTHIF	Receive FIFO Threshold Interrupt Flag (Read Only) 0 = The valid data count within the receive FIFO buffer is smaller than or equal to the setting value of RXTH. 1 = The valid data count within the receive FIFO buffer is larger than the setting value of RXTH.
[9]	RXFULL	Receive FIFO Buffer Full Indicator (Read Only) 0 = Receive FIFO buffer is not full. 1 = Receive FIFO buffer is full.
[8]	RXEMPTY	Receive FIFO Buffer Empty Indicator (Read Only) 0 = Receive FIFO buffer is not empty. 1 = Receive FIFO buffer is empty.
[7]	SLVURIF	Slave Mode TX Under Run Interrupt Flag In Slave mode, if TX underflow event occurs and the slave select line goes to inactive state, this interrupt flag will be set to 1. 0 = No Slave TX under run event. 1 = Slave TX under run event occurred. Note: This bit will be cleared by writing 1 to it.
[6]	SLVBEIF	Slave Mode Bit Count Error Interrupt Flag In Slave mode, when the slave select line goes to inactive state, if bit counter is mismatch with DWIDTH, this interrupt flag will be set to 1. 0 = No Slave mode bit count error event. 1 = Slave mode bit count error event occurred. Note: If the slave select active but there is no any bus clock input, the SLVBEIF also active when the slave select goes to inactive state. This bit will be cleared by writing 1 to it.
[5]	SLVTOIF	Slave Time-out Interrupt Flag

		<p>When the slave select is active and the value of SLVTOCNT is not 0, if the bus clock is detected, the slave time-out counter in QSPI controller logic will be started. When the value of time-out counter is greater than or equal to the value of SLVTOCNT (QSPiX_SSCTL[31:16]) before one transaction is done, the slave time-out interrupt event will be asserted.</p> <p>0 = Slave time-out is not active. 1 = Slave time-out is active.</p> <p>Note: This bit will be cleared by writing 1 to it.</p>
[4]	SSLINE	<p>Slave Select Line Bus Status (Read Only)</p> <p>0 = The slave select line status is 0. 1 = The slave select line status is 1.</p> <p>Note: This bit is only available in Slave mode. If SSACTPOL (QSPiX_SSCTL[2]) is set 0, and the SSSLINE is 1, the QSPI slave select is in inactive status.</p>
[3]	SSINAIF	<p>Slave Select Inactive Interrupt Flag</p> <p>0 = Slave select inactive interrupt was cleared or not occurred. 1 = Slave select inactive interrupt event occurred.</p> <p>Note: Only available in Slave mode. This bit will be cleared by writing 1 to it.</p>
[2]	SSACTIF	<p>Slave Select Active Interrupt Flag</p> <p>0 = Slave select active interrupt was cleared or not occurred. 1 = Slave select active interrupt event occurred.</p> <p>Note: Only available in Slave mode. This bit will be cleared by writing 1 to it.</p>
[1]	UNITIF	<p>Unit Transfer Interrupt Flag</p> <p>0 = No transaction has been finished since this bit was cleared to 0. 1 = QSPI controller has finished one unit transfer.</p> <p>Note: This bit will be cleared by writing 1 to it.</p>
[0]	BUSY	<p>Busy Status (Read Only)</p> <p>0 = QSPI controller is in idle state. 1 = QSPI controller is in busy state.</p> <p>The following lists the bus busy conditions:</p> <ul style="list-style-type: none"> f. SPIEN (QSPiX_CTL[0]) = 1 and TXEMPTY = 0. g. For QSPI Master mode, SPIEN (QSPiX_CTL[0]) = 1 and TXEMPTY = 1 but the current transaction is not finished yet. h. For QSPI Master mode, SPIEN (QSPiX_CTL[0]) = 1 and RXONLY = 1. i. For QSPI Slave mode, SPIEN (QSPiX_CTL[0]) = 1 and there is serial clock input into the QSPI core logic when slave select is active. j. For QSPI Slave mode, SPIEN (QSPiX_CTL[0]) = 1 and the transmit buffer or transmit shift register is not empty even if the slave select is inactive.

QSPI Data Transmit Register (QSPiX_TX)

If the RXEMPTY (QSPiX_STATUS[8]) is not set to 1, the receive FIFO buffers can be accessed through software by reading this register.</p>

6.17 I²C Serial Interface Controller (I²C)

6.17.1 Overview

I²C is a two-wire, bi-directional serial bus that provides a simple and efficient method of data exchange between devices. The I²C standard is a true multi-master bus including collision detection and arbitration that prevents data corruption if two or more masters attempt to control the bus simultaneously.

There are two sets of I²C controllers that support Power-down wake-up function.

6.17.2 Features

The I²C bus uses two wires (SDA and SCL) to transfer information between devices connected to the bus. The main features of the I²C bus include:

- Supports up to two I²C ports
- Master/Slave mode
- Bidirectional data transfer between masters and slaves
- Multi-master bus (no central master)
- Supports Standard mode (100 kbps), Fast mode (400 kbps) and Fast mode plus (1 Mbps)
- Arbitration between simultaneously transmitting masters without corruption of serial data on the bus
- Serial clock synchronization allow devices with different bit rates to communicate via one serial bus
- Serial clock synchronization used as a handshake mechanism to suspend and resume serial transfer
- Built-in 14-bit time-out counter requesting the I²C interrupt if the I²C bus hangs up and timer-out counter overflow
- Programmable clocks allow for versatile rate control
- Supports 7-bit addressing and 10-bit addressing mode
- Supports multiple address recognition (four slave address with mask option)
- Supports Power-down wake-up function
- Supports PDMA with one buffer capability
- Supports setup/hold time programmable
- Supports Bus Management (SM/PM compatible) function.

6.17.5 Functional Description

On I²C bus, data is transferred between a Master and a Slave. Data bits transfer on the SCL and SDA lines are synchronously on a byte-by-byte basis. Each data byte is 8-bit long. There is one SCL clock pulse for each data bit with the MSB being transmitted first, and an acknowledge bit follows each transferred byte. Each bit is sampled during the high period of SCL; therefore, the SDA line may be changed only during the low period of SCL and must be held stable during the high period of SCL. A transition on the SDA line while SCL is high is interpreted as a command (START or STOP). Please refer to Figure 6.17-2 for more detailed I²C BUS Timing.

Figure 6.17-2 I²C Bus Timing

The on-chip I²C provides the serial interface that meets the I²C bus standard mode specification. The I²C port handles byte transfers autonomously. To enable this port, the bit I2CEN in I2C_CTL0 should be

set to '1'. The I²C hardware interfaces to the I²C bus via two pins: SDA and SCL. When I/O pins are used as I²C ports, user must set the pins function to I²C in advance.

Note: -up resistor is needed for I²C operation as the SDA and SCL are open-drain pins.

6.17.5.1 I²C Protocol

Figure 6.17-3 shows the typical I²C protocol. Normally, a standard communication consists of four parts:

- START or Repeated START signal generation
- Slave address and R/W bit transfer
- Data transfer
- STOP signal generation

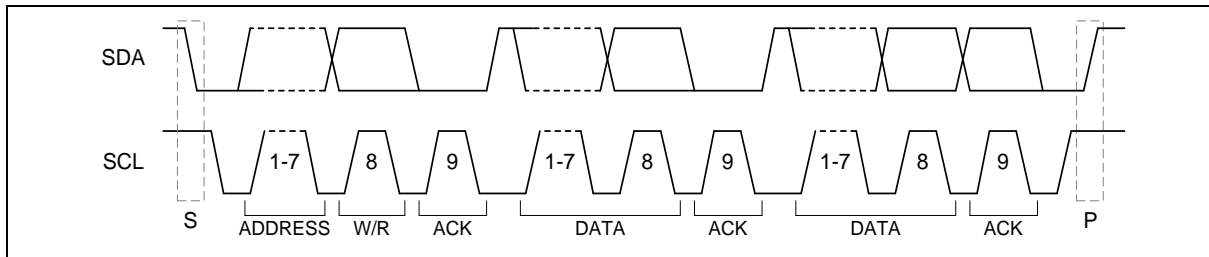

Figure 6.17-3 I²C Protocol

- START or Repeated START signal

When the bus is free/idle, which means no master device is engaging the bus (both SCL and SDA lines are high), a master can initiate a transfer by sending a START signal. A START signal, usually referred to as the “S” bit, is defined as a HIGH to LOW transition on the SDA line while SCL is HIGH. The START signal denotes the beginning of a new data transmission.

After having sent the address byte (address and read/write bit), the master may send any number of bytes followed by a stop condition. Instead of sending the stop condition it is also allowed to send another start condition again followed by an address (and of course including a read/write bit) and more data. The start condition is called as Repeat START (Sr). This is defined recursively allowing any number of start conditions to be sent. The purpose of this is to allow combined write/read operations to one or more devices without releasing the bus and thus with the guarantee that the operation is not interrupted. The controller uses this method to communicate with another slave or the same slave in a different transfer direction (e.g. from writing to a device to reading from a device) without releasing the bus.

- STOP signal

The master can terminate the communication by generating a STOP signal. A STOP signal, usually referred to as the “P” bit, is defined as a LOW to HIGH transition on the SDA line while SCL is HIGH.

Figure 6.17-4 shows the waveform of START, Repeat START and STOP.

Figure 6.17-4 START and STOP Conditions

- Slave Address Transfer

After a (Repeated) START condition, the master sends a slave address to identify the target device of the communication. The start address can comprise one or two address bytes (for 7-bit or for 10-bit addressing schemes). After an address byte, a slave sensitive to the transmitted address has to acknowledge the reception.

Therefore, the slave's address can be programmed in the device, where it is compared to the received address. In case of a match, the slave answers with an acknowledge (SDA = 0). Slaves that are not targeted answer with a non-acknowledge (SDA = 1). In addition to the match of the programmed address, another address byte value has to be answered with an acknowledge if the slave is capable to handle the corresponding requests.

- Data Transfer

When a slave receives a correct address with an R/W bit, the data will follow R/W bit specified to transfer. Each transferred byte is followed by an acknowledge bit on the 9th SCL clock cycle. If the slave signals a Not Acknowledge (NACK), the master can generate a STOP signal to abort the data transfer or generate a Repeated START signal and start a new transfer cycle.

If the master, as a receiving device, does Not Acknowledge (NACK) the slave, the slave releases the SDA line for the master to generate a STOP or Repeated START signal. The Figure 6.17-5 and Figure 6.17-6 shows the waveform of bit transfer and acknowledge.

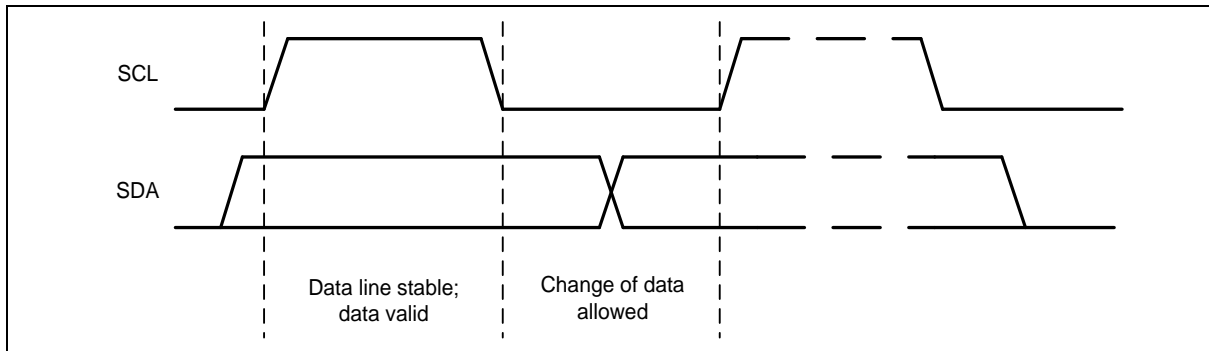

Figure 6.17-5 Bit Transfer on the I²C Bus

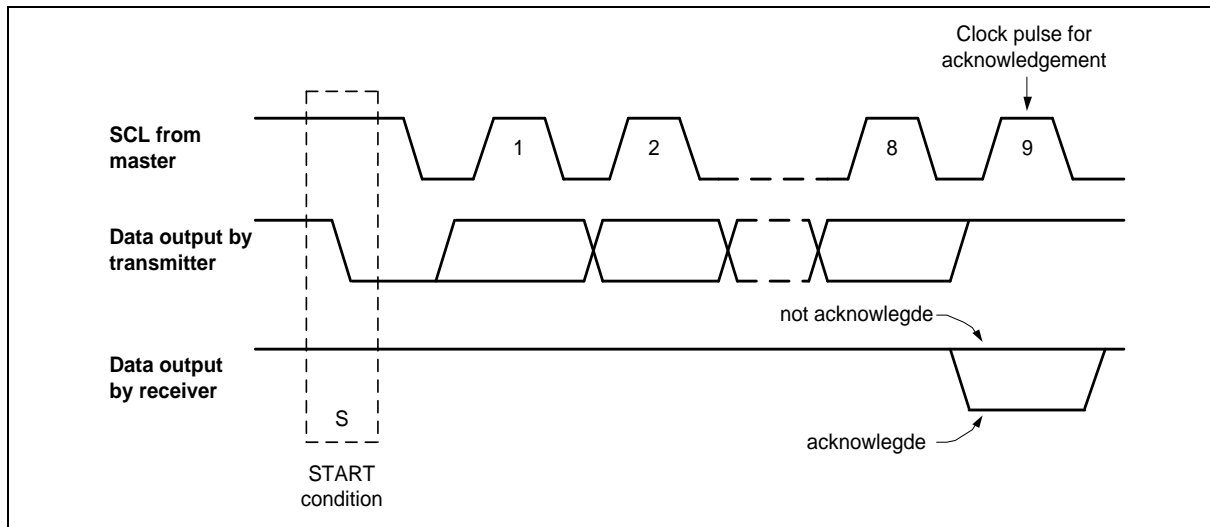

Figure 6.17-6 Acknowledge on the I²C Bus

- Data transfer on I²C bus

Figure 6.17-7 shows a master transmits data to slave by 7-bit. A master addresses a slave with a 7-bit address and 1-bit write index to denote that the master wants to transmit data to the slave. The master keeps transmitting data after the slave returns acknowledge to the master.

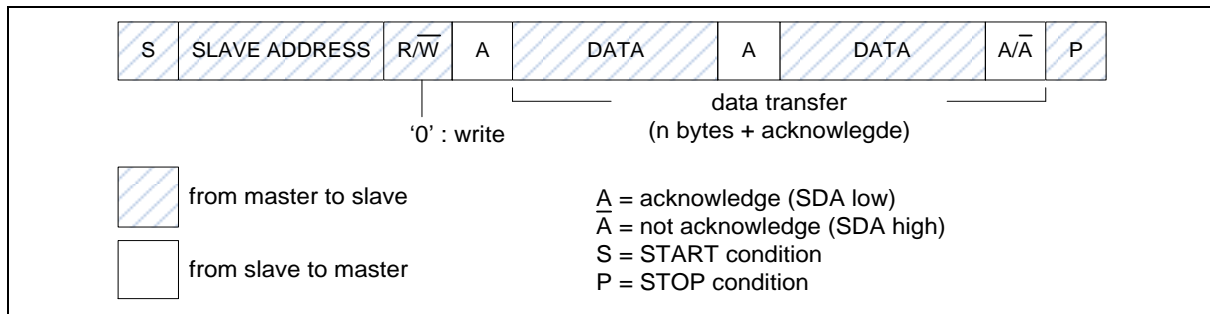

Figure 6.17-7 Master Transmits Data to Slave by 7-bit

Figure 6.17-8 shows a master read data from slave by 7-bit. A master addresses a slave with a 7-bit address and 1-bit read index to denote that the master wants to read data from the slave. The slave will start transmitting data after the slave returns acknowledge to the master.

Figure 6.17-8 Master Reads Data from Slave by 7-bit

Figure 6.17-9 shows a master transmits data to slave by 10-bit. A master addresses a slave with a 10-bit address. First byte contains 10-bit address indicator (5'b11110) and 2-bit address with write index, second byte contains 8-bit address. The master keeps transmitting data after the second byte end. Note that 7-bit and 10-bit address device can work on the same bus.

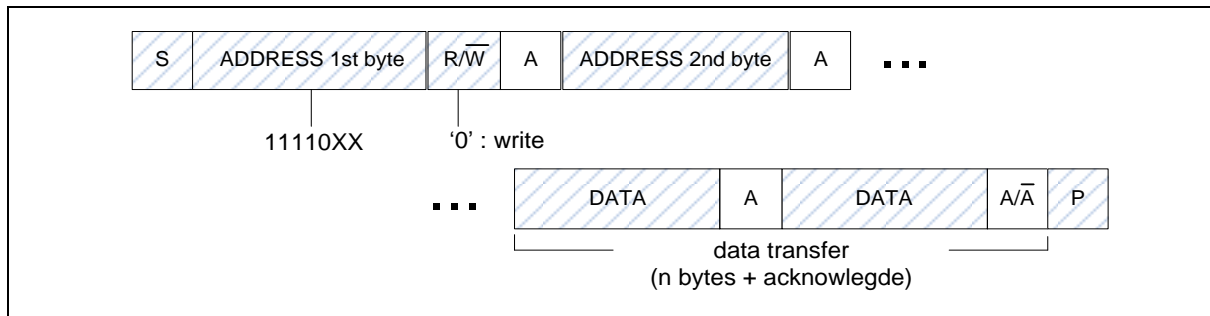

Figure 6.17-9 Master Transmits Data to Slave by 10-bit

Figure 6.17-10 shows a master read data from slave by 10-bit. A master addresses a slave with a 10-bit address. First mater transmits 10-bit address to slave, after that master transmits first byte with read index. The slave will start transmitting data after the first byte with read index.

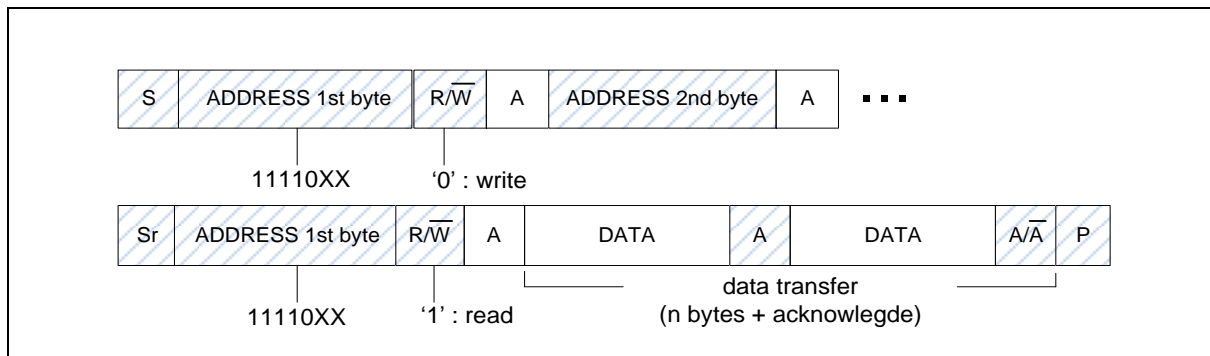

Figure 6.17-10 Master Reads Data from Slave by 10-bit

6.17.5.2 Operation Modes

The on-chip I²C ports support three operation modes, Master, Slave, and General Call Mode.

In a given application, I²C port may operate as a master or as a slave. In Slave mode, the I²C port hardware looks for its own slave address and the general call address. If one of these addresses is detected, and if the slave is willing to receive or transmit data from/to master (by setting the AA bit), acknowledge pulse will be transmitted out on the 9th clock, hence an interrupt is requested on both master and slave devices if interrupt is enabled. When the microcontroller wishes to become the bus master, hardware waits until the bus is free before entering Master mode so that a possible slave action is not be interrupted. If bus arbitration is lost in Master mode, I²C port switches to Slave mode immediately and can detect its own slave address in the same serial transfer.

To control the I²C bus transfer in each mode, user needs to set I2C_CTL0, I2C_DAT registers according to current status code of I2C_STATUS0 register. In other words, for each I²C bus action, user needs to check current status by I2C_STATUS0 register, and then set I2C_CTL0, I2C_DAT registers to take bus action. Finally, check the response status by I2C_STATUS0.

The bits, STA, STO and AA in I2C_CTL0 register are used to control the next state of the I²C hardware after SI flag of I2C_CTL0 [3] register is cleared. Upon completion of the new action, a new status code will be updated in I2C_STATUS0 register and the SI flag of I2C_CTL0 register will be set. But the SI flag will not be set when I²C STOP. If the I²C interrupt control bit INTEN (I2C_CTL0 [7]) is set, appropriate action or software branch of the new status code can be performed in the Interrupt service routine.

Figure 6.17-11 shows the current I²C status code is 0x08, and then set I2C_DATA=SLA+W and (STA,STO,SI,AA) = (0,0,1,x) to send the address to I²C bus. If a slave on the bus matches the address and response ACK, the I2C_STATUS0 will be updated by status code 0x18.

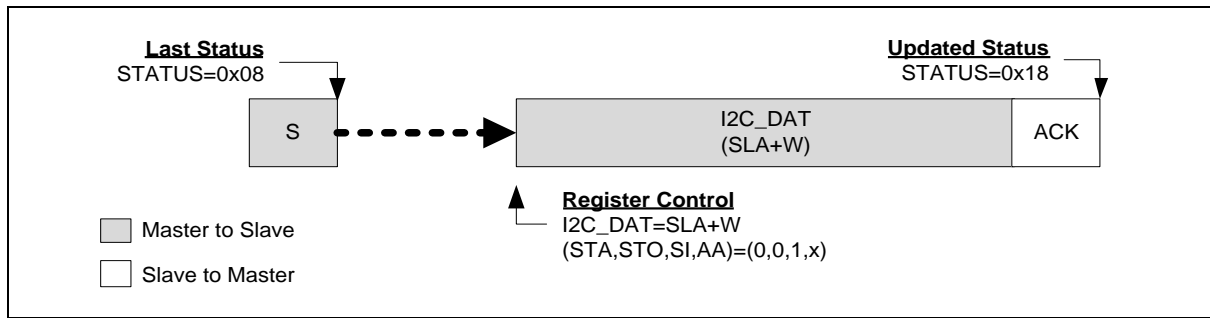

Figure 6.17-11 Control I²C Bus according to the Current I²C Status

Master Mode

In Figure 6.17-12 and Figure 6.17-13, all possible protocols for I²C master are shown. User needs to follow proper path of the flow to implement required I²C protocol.

In other words, user can send a START signal to bus and I²C will be in Master Transmitter (MT) mode (Figure 6.17-12) or Master receiver (MR) mode (Figure 6.17-13) after START signal has been sent successfully and new status code would be 0x08. Followed by START signal, user can send slave address, read/write bit, data and Repeat START, STOP to perform I²C protocol.

Figure 6.17-12 Master Transmitter Mode Control Flow

M251/M252 SERIES TECHNICAL REFERENCE MANUAL

Figure 6.17-13 Master Receiver Mode Control Flow

If the I²C is in Master mode and gets arbitration lost, the status code will be 0x38. In status 0x38, user may set (STA, STO, SI, AA) = (1, 0, 1, X) to send START to re-start Master operation when bus become free. Otherwise, user may set (STA, STO, SI, AA) = (0, 0, 1, X) to release I²C bus and enter not addressed Slave mode.

Slave Mode

When reset default, I²C is not addressed and will not recognize the address on I²C bus. User can set slave address by I2C_ADDRn (n=0~3) and set (STA, STO, SI, AA) = (0, 0, 1, 1) to let I²C recognize the address sent by master. Figure 6.17-14 shows all the possible flow for I²C in Slave mode. Users need to follow a proper flow (as shown in Figure 6.17-14 to implement their own I²C protocol.

If bus arbitration is lost in Master mode, I²C port switches to Slave mode immediately and can detect its own slave address in the same serial transfer. If the detected address is SLA+W (Master want to write data to Slave) after arbitration lost, the status code is 0x68. If the detected address is SLA+R (Master want to read data from Slave) after arbitration lost, the status code is 0xB0.

Note: During I²C communication, the SCL clock will be released when writing ‘1’ to clear SI flag in Slave mode.

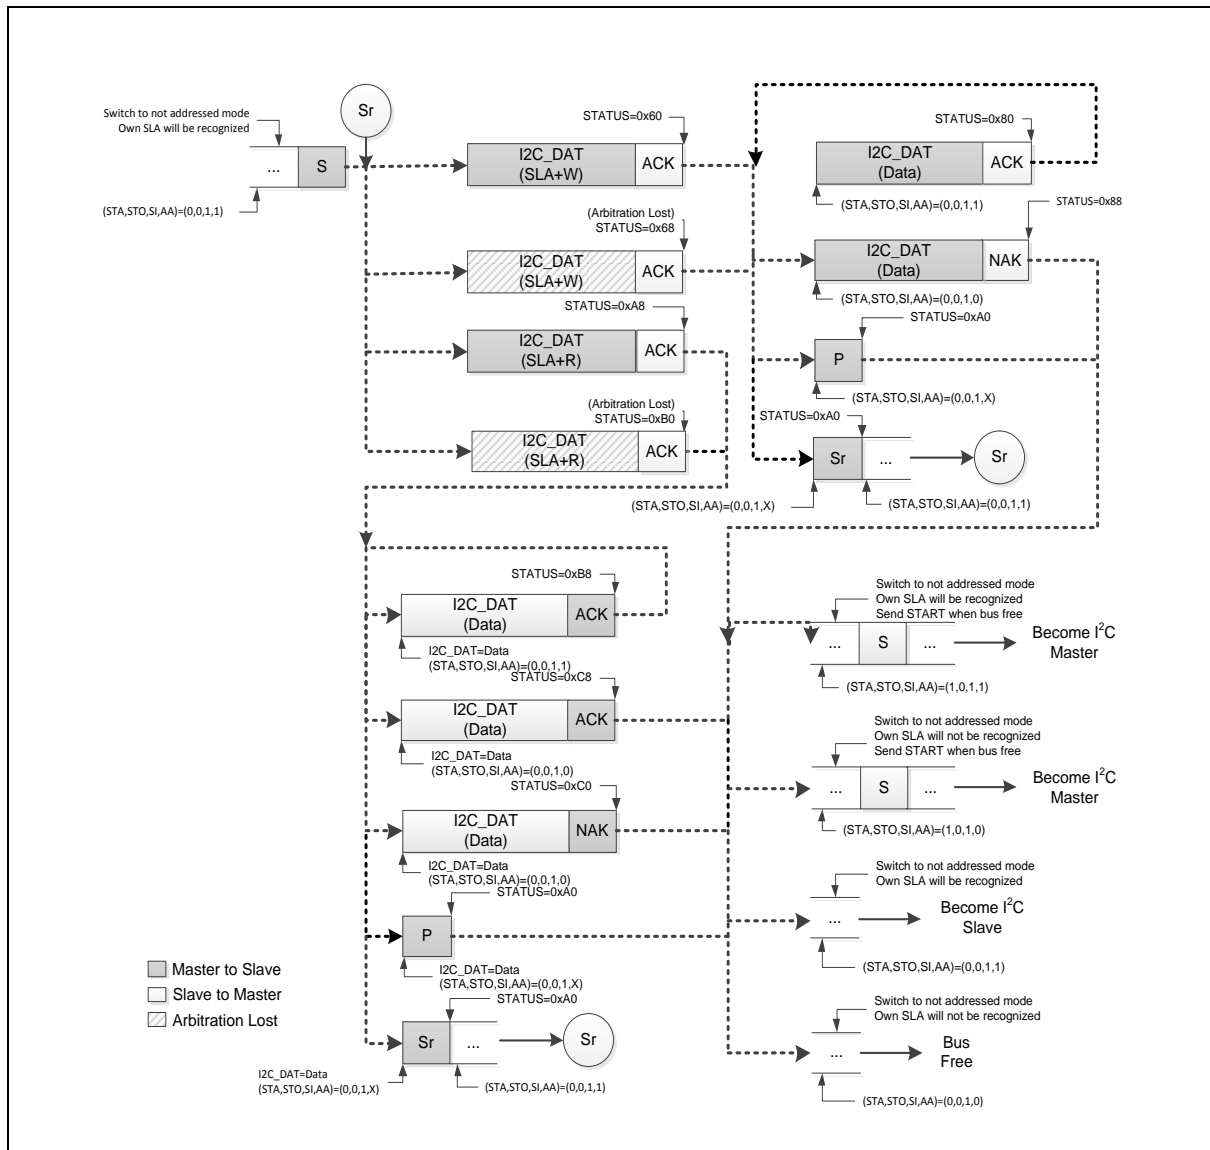

Figure 6.17-14 Slave Mode Control Flow

If I²C is still receiving data in addressed Slave mode but got a STOP or Repeat START, the status code will be 0xA0. User could follow the action for status code 0x88 as shown in the above figure when getting 0xA0 status.

If I²C is still transmitting data in addressed Slave mode but got a STOP or Repeat START, the status code will be 0xA0. User could follow the action for status code 0xC8 as shown in the above figure when getting 0xA0 status.

Note: After slave gets status of 0x88, 0xC8, 0xC0 and 0xA0, slave can switch to not address mode and own SLA will not be recognized. If entering this status, slave will not receive any I²C signal or address from master. At this status, I²C should enter idle mode.

General Call (GC) Mode

If the GC bit (I2C_ADDRn [0]) is set, the I²C port hardware will respond to General Call address (00H). User can clear GC bit to disable general call function. When the GC bit is set and the I²C in Slave mode, it can receive the general call address by 0x00 after master send general call address to I²C bus, then it will follow status of GC mode.

The GC mode can wake up when address matched. Note that the default address is 0x00, but user must set an address except for 0x00.

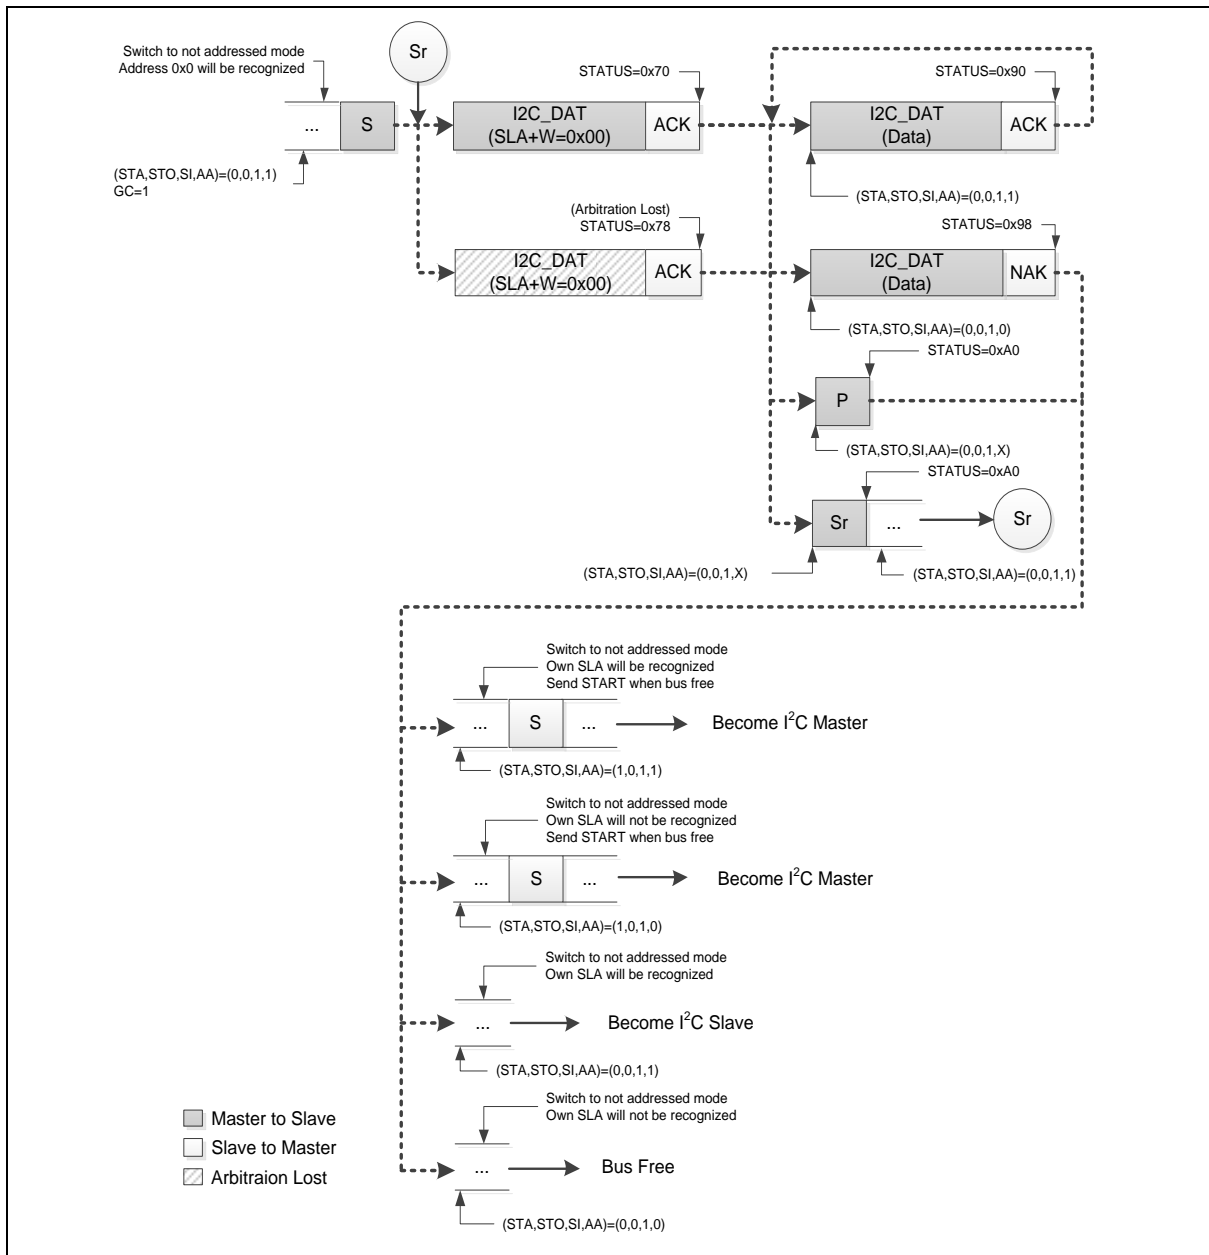

Figure 6.17-15 GC Mode

If I²C is still receiving data in GC mode but got a STOP or Repeat START, the status code will be 0xA0. User could follow the action for status code 0x98 in above figure when getting 0xA0 status.

Note: After slave gets status of 0x98 and 0xA0, slave can switch to not address mode and own SLA will not be recognized. If entering this status, slave will not receive any I²C signal or address from master. At this time, the I²C controller should enter idle mode.

Multi-Master

In some applications, there are two or more masters on the same I²C bus to access slaves, and the masters may transmit data simultaneously. The I²C supports multi-master by including collision detection and arbitration to prevent data corruption.

If for some reason two masters initiate command at the same time, the arbitration procedure determines which master wins and can continue with the command. Arbitration is performed on the SDA signal while the SCL signal is high. Each master checks if the SDA signal on the bus corresponds to the generated SDA signal. If the SDA signal on the bus is low but it should be high, then this master has lost arbitration. The device that has lost arbitration can generate SCL pulses until the byte ends and must then release the bus and go into slave mode. The arbitration procedure can continue until all the data is transferred. This means that in multi-master system each master must monitor the bus for collisions and act accordingly.

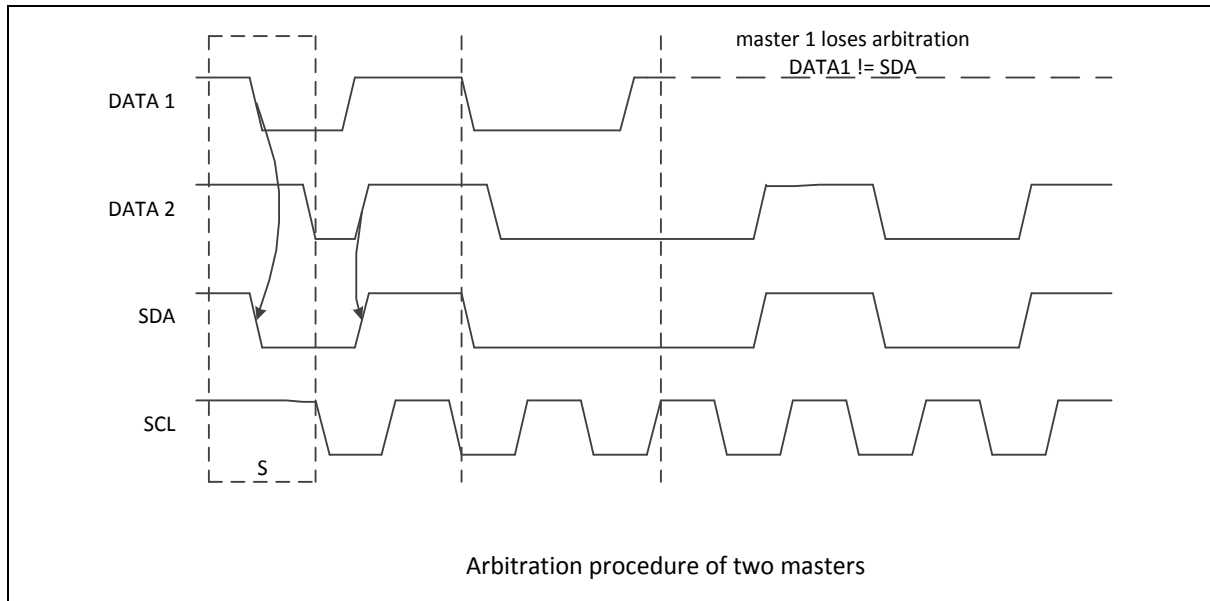

Figure 6.17-16 Arbitration Lost

- When I2C_STATUS0 = 0x38, an “Arbitration Lost” is received. Arbitration lost event maybe occur during the send START bit, data bits or STOP bit. User could set (STA, STO, SI, AA) = (1, 0, 1, X) to send START again when bus free, or set (STA, STO, SI, AA) = (0, 0, 1, X) to not addressed Slave mode. User can detect bus free by ONBUSY (I2C_STATUS1 [8]).
- When I2C_STATUS0 = 0x00, a “Bus Error” is received. To recover I²C bus from a bus error, STO should be set and SI should be cleared, and then STO is cleared to release bus.
 - Set (STA, STO, SI, AA) = (0, 1, 1, X) to stop current transfer
 - Set (STA, STO, SI, AA) = (0, 0, 1, X) to release bus

Bus Management (SMBus/PMBus Compatible)

This section is relevant only when Bus Management feature is supported.

Introduction

The Bus Management is an I²C interface through which various devices can communicate with each other and with the rest of the system. It is based on I²C principles of operation. The Bus Management provides a control bus for system and power management related tasks.

This peripheral is compatible with the SMBUS specification rev 2.0 (<http://smbus.org/specs/>) and PMBUS specification rev 1.2 (<http://pmbus.org/>).

The System Management Bus Specification refers to three types of devices.

- A slave is a device that receives or responds to a command.
- A master is a device that issues commands, generates the clocks and terminates the transfer.

- A host is a specialized master that provides the main interface to the system's CPU. A host must be a master-slave and must support the SMBus host notify protocol. Only one host is allowed in a system.

This Bus Management peripheral is based on I²C specification Rev 2.1.

Device Identification – Slave Address

Any device that exists on the Bus Management as a slave has a unique address called the Slave Address. For reference, the following addresses are reserved and must not be used by or assign to any Bus Management device. (Refer to SMBus specification for detail information)

Slave Address Bits 7-1	R/W Bit Bit 0	Comment
0000 000	0	General Call Address
0000 000	1	START byte
0000 001	X	CBUS address
0000 010	X	Address reserved for different bus format
0000 011	X	Reserved for future use
0000 1XX	X	Reserved for future use
0101 000	X	Reserved for ACCESS.bus host
0110 111	X	Reserved for ACCESS.bus default address
1111 0XX	X	10-bit slave addressing
1111 1XX	X	Reserved for future use
0001 000	X	SMBus Host
0001 100	X	SMBus Alert Response Address
1100 001	X	SMBus Device Default Address

Table 6.17-1 Reserved SMBus Address

Bus Protocols

There are eleven possible command protocols for any given device. A device may use any or all of the eleven protocols to communicate. The protocols are Quick Command, Send Byte, Receive Byte, Write Byte, Write Word, Read Byte, Read Word, Process Call, Block Read, Block Write and Block Write-Block Read Process Call. These protocols should be implemented by the user software. (For more details of these protocols, refer to SMBus specification ver. 2.0)

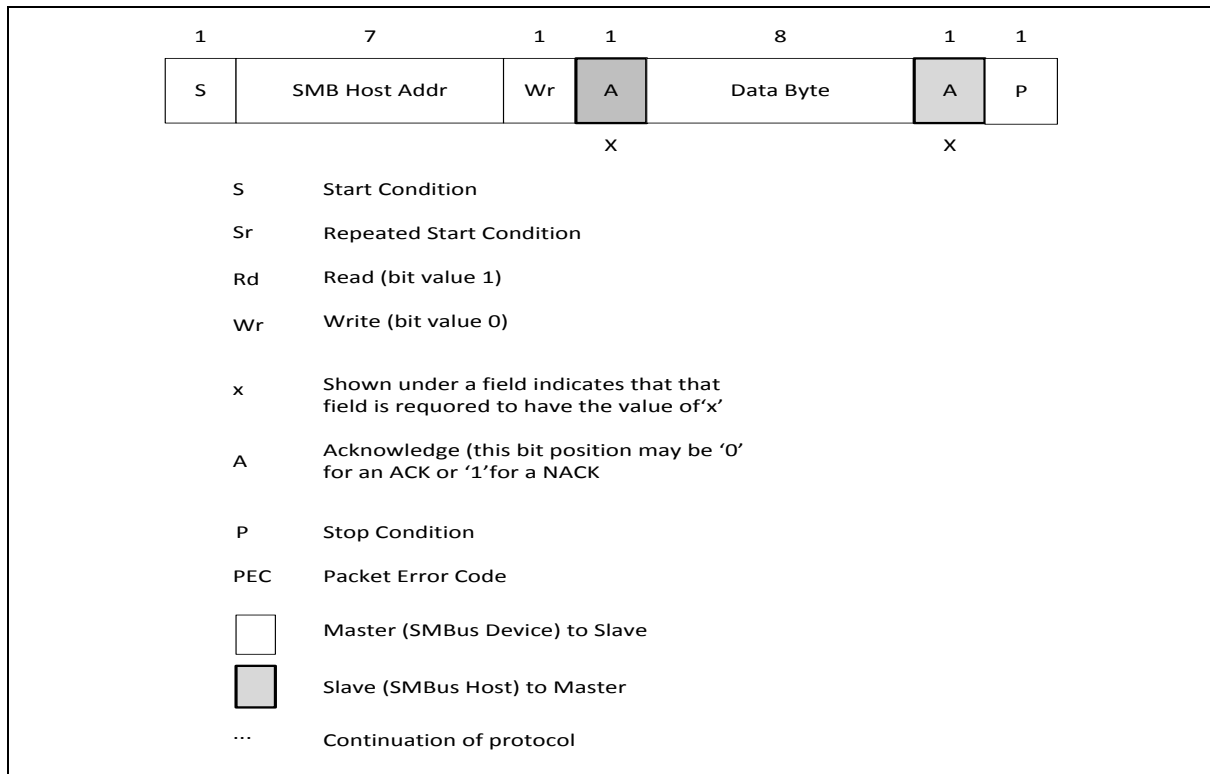

Figure 6.17-17 Bus Management Packet Protocol Diagram Element Key

Address Resolution Protocol (ARP)

Bus Management slave address conflicts can be resolved by dynamically assigning a new unique address to each slave device. In order to provide a mechanism to isolate each device for the purpose of address assignment each device must implement a unique device identifier (UDID). This 128-bit number is implemented by software.

This peripheral supports the Address Resolution Protocol (ARP). The Bus Management Device Default Address (0b1100 001) is enabled by setting BUSEN (I2C_BUSCTL[7]), BMDEN (I2C_BUSCTL[2]) and ALERTEN (I2C_BUSCTL[4]) bits. The ARP commands should be implemented by the user software. Arbitration is also performed in slave mode for ARP support.

Received Command and Data acknowledge control

A Bus Management receiver must be able to NACK each received command or data. In order to allow the ACK control in slave mode, the Slave Byte Control mode must be enabled by setting ACKMEN bit (I2C_BUSCTL[0]).

Host Notify Protocol

To prevent message coming to the Bus Management host controller from unknown devices in unknown formats only one method of communication is allowed, a modified form of the Write Word protocol. The standard Write Word protocol is modified by replacing the command code with the alerting device's address.

This peripheral supports the Host Notify protocol by setting the BUSEN (I2C_BUSCTL[7]), BMHEN (I2C_BUSCTL[3]) and ALERTEN (I2C_BUSCTL[4]). In this case the host will acknowledge the Bus Management Host address (0b0001000). This protocol is used when the device acts as a master and the host as a slave.

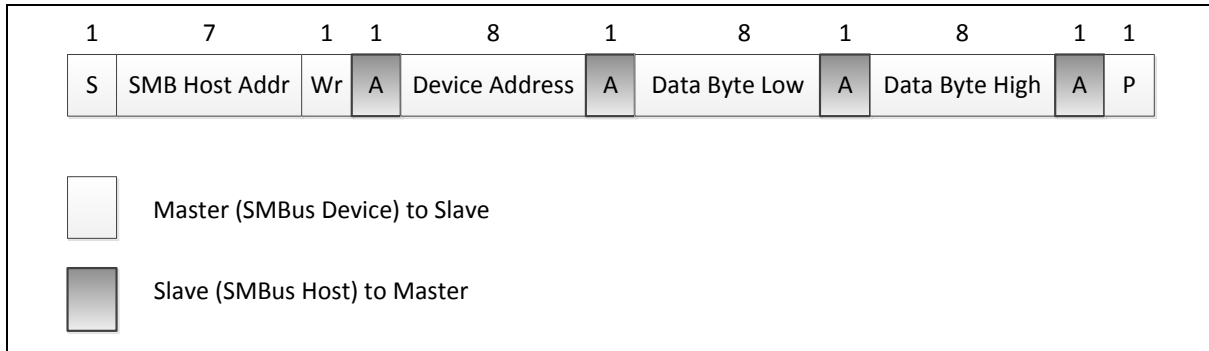

Figure 6.17-187-bit Addressable Device to Host Communication

Bus Management Alert

The Bus Management ALERT optional signal is supported. A slave-only device can signal the host through the Bus Management ALERT pin (GPA[14]/GPE[10]) that it wants to talk. The host processes the interrupt and simultaneously accesses all Bus Management ALERT pin's devices through the Alert Response Address (0b0001 100). Only the device(s) which pulled Bus Management ALERT pin low will acknowledge the Alert Response Address.

When configured as a slave device (BMHEN=0), the Bus Management ALERT pin is pulled low by setting the ALERTEN bit (I2C_BUSCTL[4]). The Alert Response Address (ARA) is enabled at the same time.

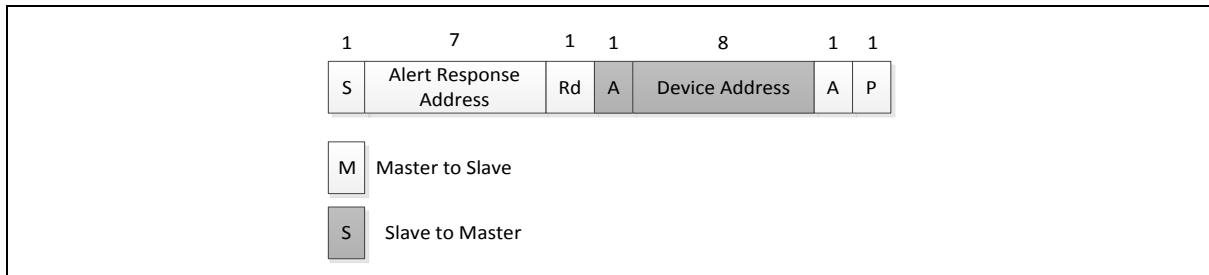

Figure 6.17-197-bit Addressable Device Responds to an ARA

When configured as a host (BMHEN=1), the ALERT flag (I2C_BUSSTS[3]) is set when a falling edge is detected on the Bus Management ALERT pin and ALERTEN=1. When ALERTEN=0, the ALERT line is considered high even if the external Bus Management ALERT pin is low. If the Bus Management ALERT pin is not needed, the Bus Management ALERT pin can be used as a standard GPIO if ALERTEN = 0;

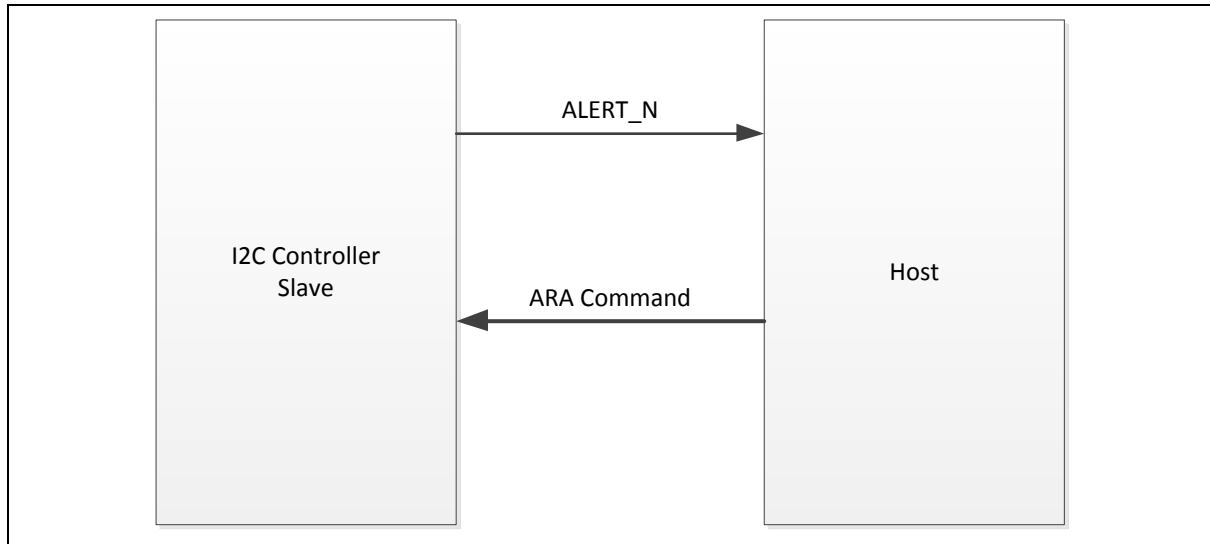

Figure 6.17-20 Bus Management ALERT function

Packet Error Checking

A packet error checking mechanism has been introduced in the SMBus specification to improve reliability and communication robustness. Packet Error Checking is implemented by appending a Packet Error Code (PEC) at the end of each message transfer. The PEC is calculated by using the $C(x) = x^8 + x^2 + x + 1$ CRC-8 polynomial on all the message bytes (including addresses and read/write bits).

The peripheral embeds a hardware PEC calculator when the PECEN bit (I2C_BUSCTL[1]) is set and allows to send a Not Acknowledge automatically when the received byte does not match with the hardware calculated PEC. The calculated value of PEC also can be read back on I2C_PKTCRC.

Time-out

This peripheral embeds hardware timers in order to be compliant with the 3 time-outs defined in SMBus specification ver. 2.0.

Bus Management Time-out:

The SCLK low time-out condition when bus no IDLE

$$T_{\text{Time-out}} = (\text{BUSTO}(\text{I2C_BUSTOUT}[7:0]) + 1) \times 16 \times 1024 \text{ (14-bit)} \times T_{\text{PCLK}} \text{ (if TOCDIV4 = 0)}$$

$$= (\text{BUSTO}(\text{I2C_BUSTOUT}[7:0]) + 1) \times 16 \times 1024 \text{ (14-bit)} \times 4 \times T_{\text{PCLK}} \text{ (if TOCDIV4 = 1)}$$

The bus idle condition (both SCLK and SDA high) when bus IDLE

$$T_{\text{Time-out}} = (\text{BUSTO}(\text{I2C_BUSTOUT}[7:0]) + 1) \times 4 \times T_{\text{PCLK}}$$

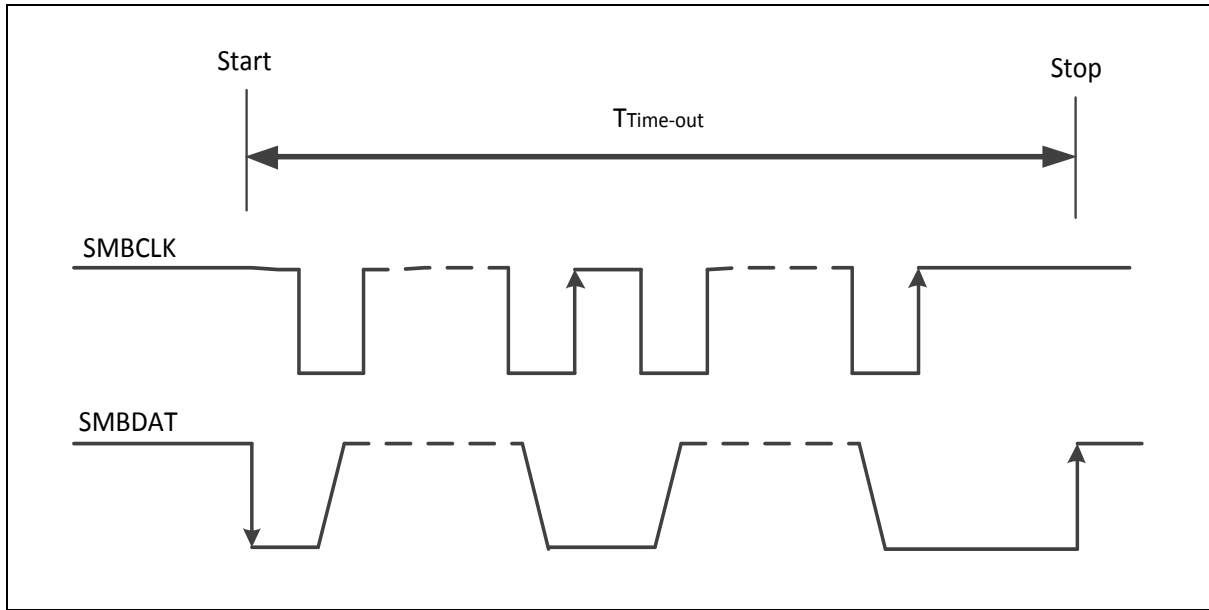

Figure 6.17-21 Bus Management Time Out Timing

Bus Clock Low Time-out:

In Master mode, the Master cumulative clock low extend time ($T_{LOW:MEXT}$) is detected

In Slave mode, the slave cumulative clock low extend time ($T_{LOW:SEXT}$) is detected

$$T_{LOW:EXT} = (CLKTO (I2C_CLKTOUT[7:0])+1) \times 16 \times 1024 \text{ (14-bit)} \times T_{PCLK} \text{ (if TOCDIV4= 0).}$$

$$= (CLKTO (I2C_CLKTOUT[7:0])+1) \times 16 \times 1024 \text{ (14-bit)} \times 4 \times T_{PCLK} \text{ (if TOCDIV4= 1)}$$

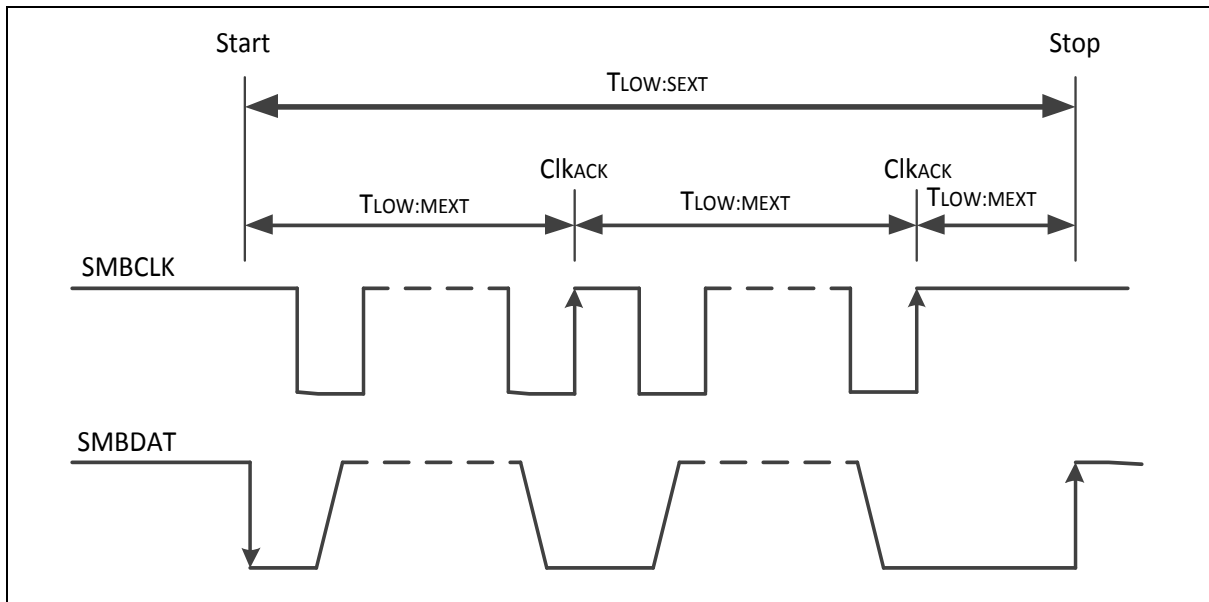

Figure 6.17-22 Bus Clock Low Time Out Timing

Bus Idle Detection

A master can assume that the bus is free if it detects that the clock and data signals have been high for T_{IDLE} greater than $T_{HIGH,MAX}$.

This timing parameter covers the condition where a master has been dynamically added to the bus and

may not have detected a state transition on the SMBCLK or SMBDAT lines. In this case, the master must wait long enough to ensure that a transfer is not currently in progress. The peripheral supports a hardware bus idle detection.

6.17.5.3 PDMA Transfer Function

The I²C controller supports PDMA transfer function. When TXPDMAEN (I2C_CTL1 [0]) is set to 1, the I²C controller will issue request to PDMA controller to start the DMA transmission process automatically.

When RXPDMAEN (I2C_CTL1 [1]) is set to 1, the I²C controller will start the receive PDMA process. The I²C controller will issue the request to PDMA controller automatically when there is data written into the received BUFFER.

When I²C enters PDMA mode, the mostly status interrupt will be masked. Let the interrupt not occur besides the bus error or NACK or STOP interrupt (0x20, 0x30, 0x38, 0x48, 0x58, 0x00, 0xA0, 0xC0, 0x88 and 0x98).

Set the PDMASTR (I2C_CTL1 [8]) only the I²C controller in master TX mode. If PDMASTR is cleared to 0, I²C will send STOP automatically after PDMA transfer done and buffer empty. If PDMASTR is set to 1, SI will be set to 1 and I²C bus will be stretched by hardware after PDMA transfer done and buffer empty.

6.17.5.4 Programmable setup and hold times

To guarantee a correct data setup and hold time, the timing must be configured. By programming HTCTL (I2C_TMCTL[24:16]) to configure hold time and STCTL (I2C_TMCTL[8:0]) to configure setup time.

The delay timing refer peripheral clock (PCLK). When device stretch master clock, the setup and hold time configuration value will not affected by stretched.

User should focus the limitation of setup and hold time configuration, the timing setting must follow I²C protocol. Once setup time configuration greater than design limitation, that means if setup time setting make SCL output less than three PCLKs, the I²C controller can't work normally due to SCL must sample three times. And once hold time configuration greater than I²C clock limitation, I²C will occur bus error. It is suggested that user calculate suitable timing with baud rate and protocol before setting timing. Table 6.17-2 shows the relationship between I²C baud rate and PCLK, the number of table represent one clock duty contain how many PCLKs. Setup and hold time configuration even can program some extreme values in the design, but user should follow I²C protocol standard.

I ² C Baud Rate PCLK	100k	200k	400k	800k	1200k
12 MHz	120	60	30	15	10
24 MHz	240	120	60	30	20
48 MHz	480	240	120	60	40
72 MHz	720	360	180	90	60

Table 6.17-2 Relationship between I²C Baud Rate and PCLK

For setup time wrong adjustment example, assuming one SCL cycle contains 5 PCLKs and set STCTL (I2C_TMCTL[8:0]) to 3 that stretch three PCLKs for setup time setting. The setup time maximum setting value: $ST_{limit} = (I2C_CLKDIV[7:0]+1) \times 2 - 6$.

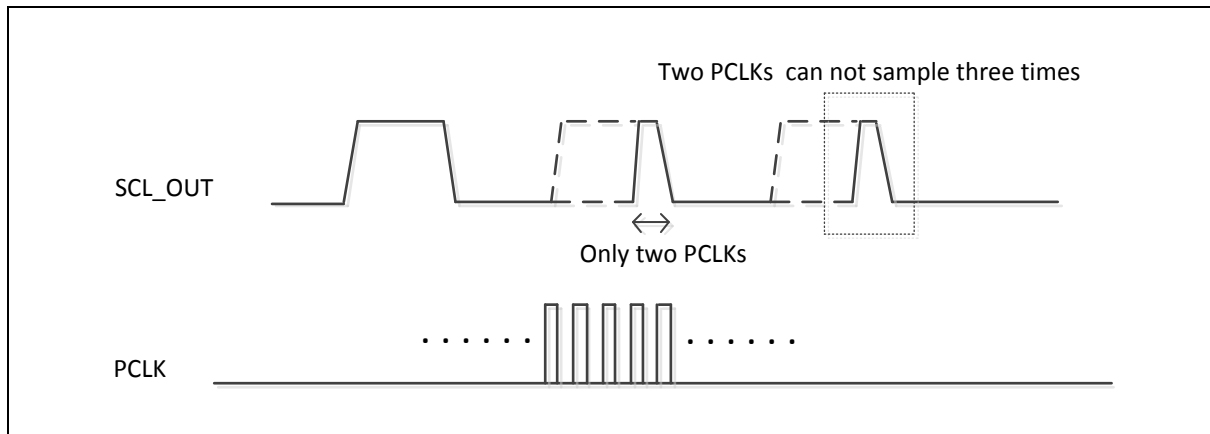

Figure 6.17-23 Setup Time Wrong Adjustment

For hold time wrong adjustment example, use I²C Baud Rate = 1200k and PCLK = 72 MHz, the SCL high/low duty = 60 PCLK. When HTCTL (I2C_TMCTL[24:16]) is set to 61 and STCTL (I2C_TMCTL[8:0]) is set to 0, then SDA output delay will over SCL high duty and cause bus error. The hold time maximum setting value: $HT_{limit} = (I2C_CLKDIV[7:0]+1) \times 2 - 9$.

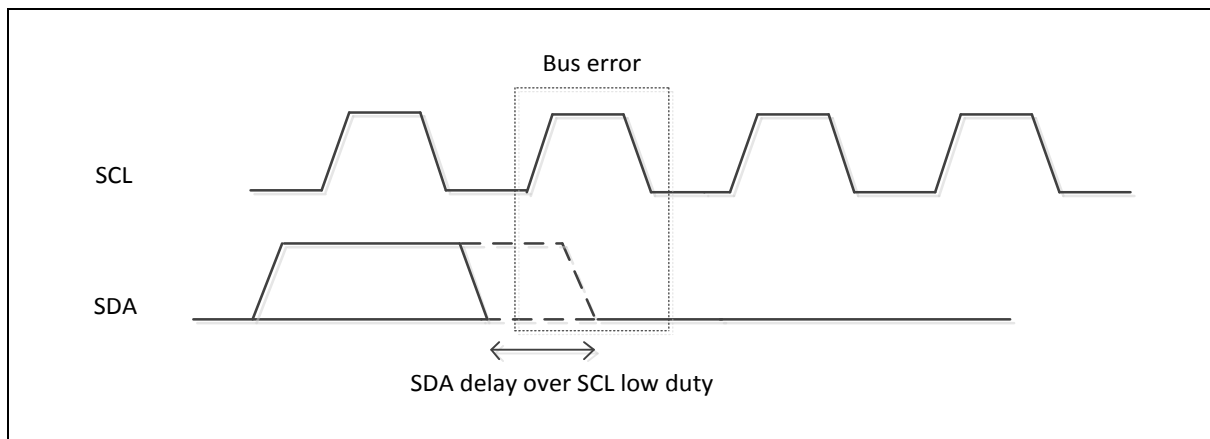

Figure 6.17-24 Hold Time Wrong Adjustment

6.17.5.5 I²C Protocol Registers

To control I²C port through the following fifteen special function registers: I2C_CTL0 (control register), I2C_STATUS0 (status register), I2C_DAT (data register), I2C_ADDRn (address registers, n=0~3), I2C_ADDRMSKn (address mask registers, n=0~3), I2C_CLKDIV (clock rate register), I2C_TOCTL (Time-out control register), I2C_WKCTL(wake up control register) and I2C_WKSTS(wake up status register).

Address Registers (I2C_ADDR)

The I²C port is equipped with four slave address registers, I2C_ADDRn (n=0~3). The contents of the register are irrelevant when I²C is in Master mode. In Slave mode, the bit field ADDR(I2C_ADDRn[7:1]) must be loaded with the chip's own slave address. The I²C hardware will react if the contents of I2C_ADDRn are matched with the received slave address.

The I²C ports support the "General Call" function. If the GC bit (I2C_ADDRn [0]) is set the I²C port hardware will respond to General Call address (00H). Clear GC bit to disable general call function.

When the GC bit is set and the I²C is in Slave mode, it can receive the general call address by 00H after Master send general call address to I²C bus, then it will follow status of GC mode.

Slave Address Mask Registers (I2C_ADDRMSK)

The I²C bus controller supports multiple address recognition with four address mask registers I2C_ADDRMSK_n (n=0~3). When the bit in the address mask register is set to 1, it means the received corresponding address bit is "Don't care". If the bit is set to 0, it means the received corresponding register bit should be exactly the same as address register.

Data Register (I2C_DAT)

This register contains a byte of serial data to be transmitted or a byte which just has been received. The CPU can be read from or written to the 8-bit (I2C_DAT [7:0]) directly while it is not in the process of shifting a byte. When I²C is in a defined state and the serial interrupt flag (SI) is set, data in I2C_DAT [7:0] remains stable. While data is being shifted out, data on the bus is simultaneously being shifted in; I2C_DAT [7:0] always contains the last data byte presented on the bus.

The acknowledge bit is controlled by the I²C hardware and cannot be accessed by the CPU. Serial data is shifted into I2C_DAT [7:0] on the rising edges of serial clock pulses on the SCL line. When a byte has been shifted into I2C_DAT [7:0], the serial data is available in I2C_DAT [7:0], and the acknowledge bit (ACK or NACK) is returned by the control logic during the ninth clock pulse. In order to monitor bus status while sending data, the bus data will be shifted to I2C_DAT[7:0] when sending I2C_DAT[7:0] to bus. In the case of sending data, serial data bits are shifted out from I2C_DAT [7:0] on the falling edge of SCL clocks, and is shifted to I2C_DAT [7:0] on the rising edge of SCL clocks. Figure 6.17-25 shows I²C Data Shifting Direction.

Figure 6.17-25 I²C Data Shifting Direction

Control Register (I2C_CTL0)

The CPU can be read from and written to I2C_CTL0 [7:0] directly. When the I²C port is enabled by setting I2CEN (I2C_CTL0 [6]) to high, the internal states will be controlled by I2C_CTL0 and I²C logic hardware.

There are two bits are affected by hardware: the SI bit is set when the I²C hardware requests a serial interrupt, and the STO bit is cleared when a STOP condition is present on the bus. The STO bit is also cleared when I2CEN = 0.

Once a new status code is generated and stored in I2C_STATUS0, the I²C Interrupt Flag bit SI (I2C_CTL0 [3]) will be set automatically. If the Enable Interrupt bit INTEN (I2C_CTL0 [7]) is set at this time, the I²C interrupt will be generated. The bit field I2C_STATUS0[7:0] stores the internal state code, the content keeps stable until SI is cleared by software.

Status Register (I2C_STATUS0)

I2C_STATUS0 [7:0] is an 8-bit read-only register. The bit field I2C_STATUS0 [7:0] contains the status code and there are 26 possible status codes. All states are listed in Table 6.17-3. When I2C_STATUS0 [7:0] is F8H, no serial interrupt is requested. All other I2C_STATUS0 [7:0] values correspond to the defined I²C states. When each of these states is entered, a status interrupt is requested (SI = 1). A valid status code is present in I2C_STATUS0[7:0] one cycle PCLK after SI set by hardware and is still present one cycle PCLK after SI reset by software.

In addition, the state 00H stands for a Bus Error, which occurs when a START or STOP condition is present at an incorrect position in the I²C format frame. A Bus Error may occur during the serial transfer of an address byte, a data byte or an acknowledge bit. To recover I²C from bus error, STO should be set and SI should be cleared to enter Not Addressed Slave mode. Then STO is cleared to release bus and to wait for a new communication. The I²C bus cannot recognize stop condition during this action when a

bus error occurs.

Master Mode		Slave Mode	
STATUS	Description	STATUS	Description
0x08 ^[1]	Start	0xA0	Slave Transmit Repeat Start or Stop
0x10 ^[1]	Master Repeat Start	0xA8 ^[1]	Slave Transmit Address ACK
0x18 ^[1]	Master Transmit Address ACK	0xB8 ^[1]	Slave Transmit Data ACK
0x20	Master Transmit Address NACK	0xC0	Slave Transmit Data NACK
0x28 ^[1]	Master Transmit Data ACK	0xC8 ^[1]	Slave Transmit Last Data ACK
0x30	Master Transmit Data NACK	0x60 ^[1]	Slave Receive Address ACK
0x38	Master Arbitration Lost	0x68 ^[1]	Slave Receive Arbitration Lost
0x40 ^[1]	Master Receive Address ACK	0x80 ^[1]	Slave Receive Data ACK
0x48	Master Receive Address NACK	0x88	Slave Receive Data NACK
0x50 ^[1]	Master Receive Data ACK	0x70 ^[1]	GC mode Address ACK
0x58	Master Receive Data NACK	0x78 ^[1]	GC mode Arbitration Lost
0x00	Bus error	0x90 ^[1]	GC mode Data ACK
		0x98	GC mode Data NACK
		0xB0 ^[1]	Address Transmit Arbitration Lost
0xF0	If the BMDEN =1 and the ACKMEN bit is enabled, the information of I2C_STATUS0 will be fixed as 0xF0 in slave receive condition.		
0xF8	Bus Released Note: Status "0xF8" exists in both master/slave modes, and it won't raise interrupt. Note [1]: No interrupt in PDMA mode		

Table 6.17-3 I²C Status Code Description

Clock Baud Rate Bits (I2C_CLKDIV)

The data baud rate of I²C is determined by DIVIDER(I2C_CLKDIV [7:0]) register when I²C is in Master mode, and it is not necessary in a Slave mode. In the Slave mode, I²C will automatically synchronize it with any clock frequency from master I²C device. In the slave mode, system clock frequency should be greater than I²C bus maximum clock 20 times.

The data baud rate of I²C setting is Data Baud Rate of I²C = (system clock) / (4x (I2C_CLKDIV [7:0] +1)). If system clock = 16 MHz, the I2C_CLKDIV [7:0] = 40 (28H), the data baud rate of I²C = 16 MHz / (4x (40 +1)) = 97.5 Kbits/sec.

Time-out Control Register (I2C_TOCTL)

There is a 14-bit time-out counter which can be used to deal with the I²C bus hang-up. If the time-out counter is enabled, the counter starts up counting until it overflows (TOIF=1) and generates I²C interrupt to CPU or stops counting by clearing TOCEN to 0. When time-out counter is enabled, writing 1 to the SI flag will reset counter and re-start up counting after SI is cleared. If I²C bus hangs up, it causes the I2C_STATUS0 and flag SI are not updated for a period, the 14-bit time-out counter may overflow and acknowledge CPU the I²C interrupt. Refer to Figure 6.17-26 for the 14-bit time-out counter. User may write 1 to clear TOIF to 0.

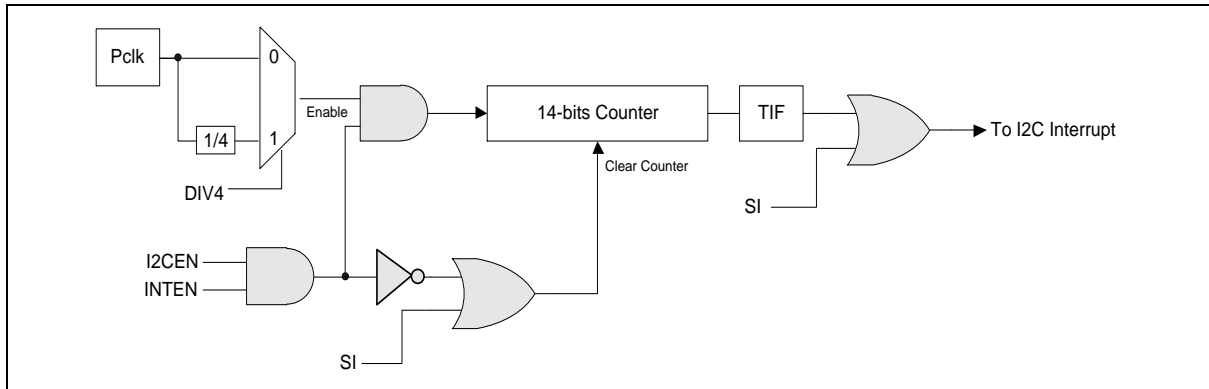

Figure 6.17-26 I²C Time-out Count Block Diagram

Wake-up Control Register (I2C_WKCTL)

When chip enters Power-down mode and sets WKEN (I2C_WKCTL [0]) to 1, other I²C master can wake up the chip by addressing the I²C device, user must configure the related setting before entering sleep mode. The ACK bit cycle of address match frame is done in power-down. The controller will stretch the SCL to low when the address is matched the device’s address and the ACK cycle done, then the I²C controller will go ahead. If NHDBUSEN (I2C_WKCTL [7]) is set, the controller will don’t stretch the SCL to low. Note that when the controller doesn’t stretch the SCL to low, transmit or receive data will perform immediately. If data transmitted or received when SI event is not clear, user must reset the I²C controller and execute the original operation again.

Wake-up Status Register (I2C_WKSTS)

When system is woken up by other I²C master device, WKIF is set to indicate this event. User needs write “1” to clear this bit.

When the chip is woken-up by address match with one of the device address register (I2C_ADDRn), the user shall check the WKAKDONE (I2C_WKSTS [1]) bit is set to 1 to confirm the address byte has done. The WKAKDONE bit indicates that the ACK bit cycle of address byte is done in power-down. The controller will stretch the SCL to low when the address is matched the device’s slave address and the ACK cycle done. The SCL is stretched until WKAKDONE is clear by user. If the frequency of SCL is low speed and the system has wakeup from address match frame, the user shall check WKAKDONE to confirm this frame has transaction done and then to do the wakeup procedure. Note that user can’t release WKIF through clearing the WKAKDONE bit to 0.

The WRSTSWK (I2C_WKSTS [2]) bit records the Read/Write command before the I²C controller sends address. The user can read this bit’s status to prepare the next transmitted data (WRSTSWK = 0) or to wait the incoming data (WRSTSWK = 1) can be stored in time after the system is woken up by the address match frame. Note that the WRSTSWK (I2C_WKSTS [2]) bit is cleared when writing one to the WKAKDONE (I2C_WKSTS [1]) bit.

When system is woken up by other I²C master device, WKIF is set to indicate this event. User needs to write “1” to clear this bit.

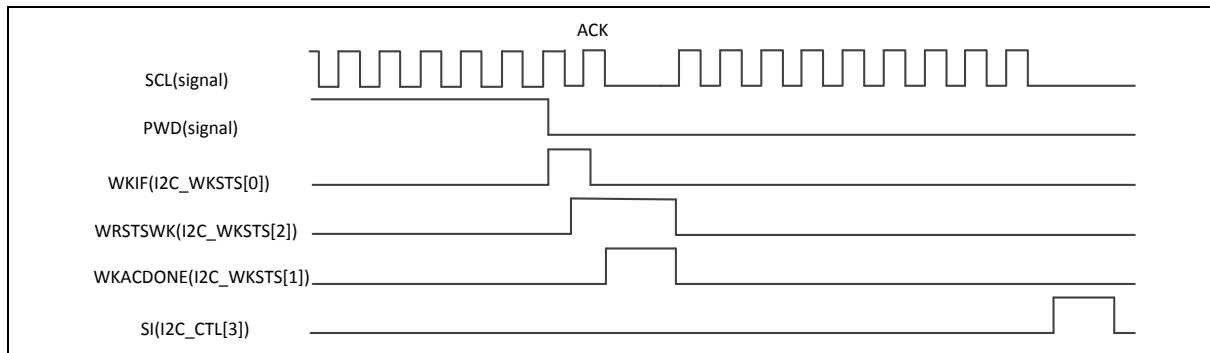

Figure 6.17-27 I²C Wake-Up Related Signals Waveform

I²C Control Register 1 (I2C_CTL1)

If enable 10-bit addressing mode ADDR10EN (I2C_CTL1 [9]) is set, the I²C will run in 10-bit mode.

For PDMA function, set TXPDMAEN (I2C_CTL1 [0]) and RXPDMAEN (I2C_CTL1 [1]) can be set to operate. And set PDMARST (I2C_CTL1 [2]) to reset the PDMA control logic.

I²C Status Register 1 (I2C_STATUS1)

The I²C controller supports four slave address flag registers, ADMAT0, ADMAT1, ADMAT2 and ADMAT3 (I2C_STATUS1[3:0]). Every control register represent which address is used and set 1 to inform software.

I²C Timing Configure Control Register (I2C_TMCTL)

In order to configure setup/hold time, the HTCTL (I2C_TMCTL[24:16]) and STCTL (I2C_TMCTL[8:0]) are set based on actual demand.

Bus Management Control Register (I2C_BUSCTL)

The SM bus management control events are defined in this register. It includes the Acknowledge Control by Manual (ACKMEN (I2C_BUSCTL[0])), Packet Error Checking Enable (PECEN (I2C_BUSCTL[1])), device (BMDEN(I2C_BUSCTL[2])) or host (BMHEN (I2C_BUSCTL[3])) enable in this peripheral device. Both the alert and the suspend function can be set in ALERTEN (I2C_BUSCTL[4]), SCTLOSTS (I2C_BUSCTL[5]) and SCTLOEN (I2C_BUSCTL[6]).

The system bus management enable control by BUSEN(I2CBUSCTL[7]) bit. The BUSTOUT(I2CBUSCTL[9]) is used to calculate the time-out of clock low in bus active and the idle period in bus Idle.

The calculated PEC (when the PECEN is set) value is transmitted or received can be controlled by PECTXEN bit (I2C_BUSCTL[8]).

There is a special bit of ACKM9SI (I2C_BUSCTL[11]). When the ACKMEN is set, there is SI interrupt in the 8th clock input and the user can read the data and status register. If the 8th clock bus is released when the SI interrupt is cleared, there is another SI interrupt event in the 9th clock cycle when this bit is set to 1 to know the bus status in this transaction frame done.

Set the PECDIEN (I2C_BUSCTL[13]), BCDIEN (I2C_BUSCTL[12]) or PECCLR (I2C_BUSCTL[10]) for PEC control flow.

I²C Bus Management Timer Control Register (I2C_BUSTCTL)

Set TORSTEN (I2C_BUSTCTL[4]), CLKTOIEN (I2C_BUSTCTL[3]), BUSTOEN (I2C_BUSTCTL[2]), CLKTOEN (I2C_BUSTCTL[1]) and BUSTOEN (I2C_BUSTCTL[0]) for bus time-out or clock low time-out control flow.

I²C Bus Management Status Register (I2C_BUSSTS)

Monitor the PECDONE (I2C_BUSSTS[7]), BCDONE (I2C_BUSSTS[1]) or PECERR (I2C_BUSSTS[2]) for PEC control flow.

Monitor the SCTLDIN (I2C_BUSSTS[4]) for SUSCON input status.

I²C Byte Number Register (I2C_PKTSIZE)

When the PECEN bit (I2C_BUSCTL[1]) is set. The I²C controller will calculate the PEC value of the data on the bus. The PLDSIZE (I2C_PKTSIZE[8:0]) is used to define the data number in the bus. When the counter reach the value of PLDSIZE, the final PEC value will be transmitted or received automatically when the PECTXEN bit (I2C_BUSCTL[8]) is set.

I²C PEC VALUR Register (I2C_PKTCRC)

The register indicates the calculated PECCRC (I2C_PKTCRC[7:0]) value of data on the I²C bus. The detail of information is defined the PEC section of SM Bus.

I²C Bus Management Timer and I²C CLock Low Timer Register (I2C_BUSTOUT/I2C_CLKTOUT)

Both of the definitions of these registers are described in the time-out section of SM Bus.

6.17.5.6 Example for Random Read on EEPROM

The following steps are used to configure the I2C0 related registers when using I²C to read data from EEPROM.

1. Set I2C0 the multi-function pin as SCL and SDA pins. The muti-function configuration reference Basic Configuration..
2. Enable I2C0 APB clock. The clock configuration reference Basic Configuration.
3. Set I2C0RST=1 to reset I2C0 controller then set I2C0 controller to normal operation. The reset controller configuration reference Basic Configuration.
4. Set I2CEN=1 to enable I2C0 controller in the "I2C_CTL0" register.
5. Give I2C0 clock a divided register value for I²C clock rate in the "I2C_CLKDIV".
6. Enable system I2C0 IRQ in system "NVIC" control register.
7. Set INTEN=1 to enable I2C0 Interrupt in the "I2C_CTL0" register.
8. Set I2C0 address registers "I2C_ADDR0 ~ I2C_ADDR3".

Random read operation is one of the methods of access EEPROM. The method allows the master to access any address of EEPROM space. Figure 6.17-28 shows the EEPROM random read operation.

Figure 6.17-28 EEPROM Random Read

Figure 6.17-29 shows how to use the I²C controller to implement the protocol of EEPROM random read.

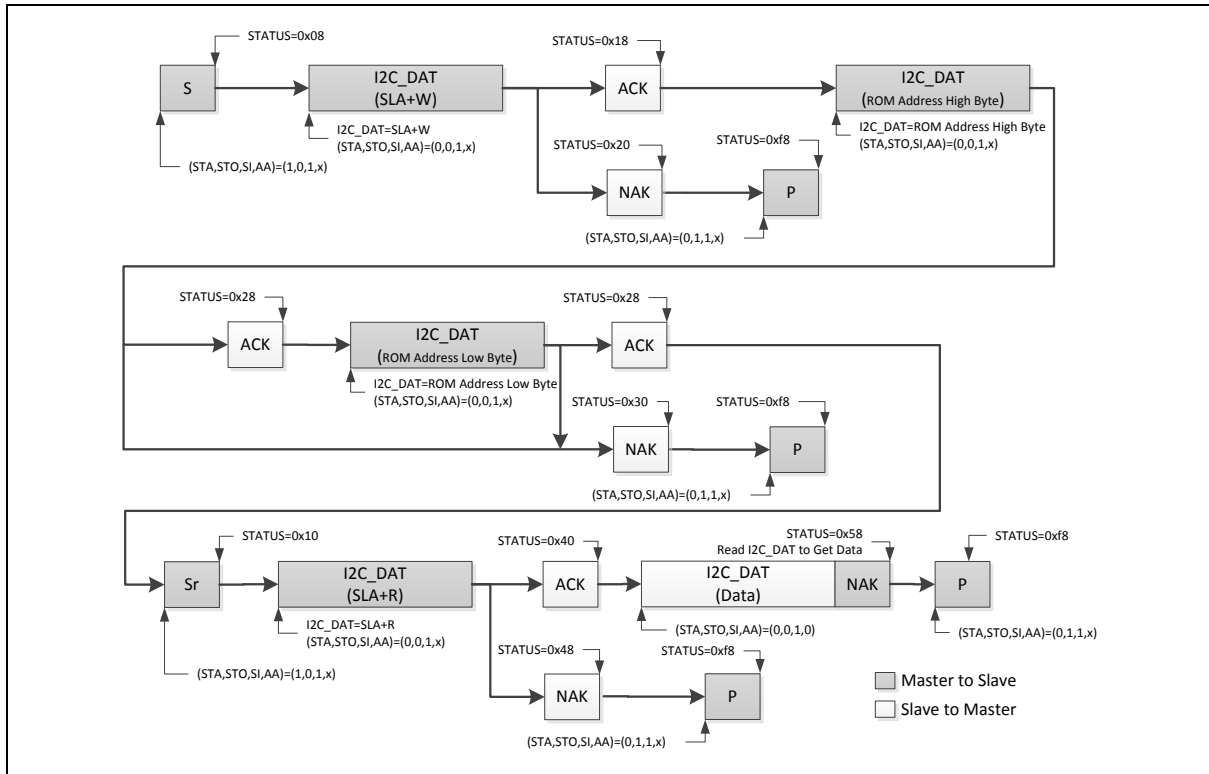

Figure 6.17-29 Protocol of EEPROM Random Read

The I²C controller, which is a master, sends START to bus. Then, it sends a SLA+W (Slave address + Write bit) to EEPROM followed by two bytes data address to set the EEPROM address to read. Finally, a Repeat START followed by SLA+R is sent to read the data from EEPROM.

6.17.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
I ² C Base Address: I2Cn_BA = 0x4008_0000 + (0x1000 *n) n= 0,1

6.17.7 Register Description

I²C Control Register (I2C_CTL0)

Register	Offset	R/W	Description	Reset Value
I2C_CTL0	I2Cn_BA+0x00	R/W	I ² C Control Register 0	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
INTEN	I2CEN	STA	STO	SI	AA	Reserved	

Bits	Description	
[31:8]	Reserved	Reserved.
[7]	INTEN	Enable Interrupt 0 = I ² C interrupt Disabled. 1 = I ² C interrupt Enabled.
[6]	I2CEN	I²C Controller Enable Bit Set to enable I ² C serial function controller. When I2CEN=1 the I ² C serial function enable. The multi-function pin function must set to SDA, and SCL of I ² C function first. 0 = I ² C controller Disabled. 1 = I ² C controller Enabled.
[5]	STA	I²C START Control Setting STA to logic 1 to enter Master mode, the I ² C hardware sends a START or Repeat START condition to bus when the bus is free.
[4]	STO	I²C STOP Control In Master mode, setting STO to transmit a STOP condition to bus then I ² C controller will check the bus condition if a STOP condition is detected. This bit will be cleared by hardware automatically.
[3]	SI	I²C Interrupt Flag When a new I ² C state is present in the I2C_STATUS0 register, the SI flag is set by hardware. If bit INTEN (I2C_CTL0 [7]) is set, the I ² C interrupt is requested. SI must be cleared by software. Clear SI by writing 1 to this bit. For ACKMEN is set in slave read mode, the SI flag is set in 8th clock period for user to confirm the acknowledge bit and 9th clock period for user to read the data in the data buffer.
[2]	AA	Assert Acknowledge Control When AA =1 prior to address or data is received, an acknowledged (low level to SDA) will be returned during the acknowledge clock pulse on the SCL line when 1.) A slave is acknowledging the address sent from master, 2.) The receiver devices are acknowledging the data sent by transmitter. When AA=0 prior to address or data received, a Not acknowledged (high level to SDA) will be returned during the acknowledge clock pulse on the SCL line.

[1:0]	Reserved	Reserved.

7	6	5	4	3	2	1	0
STATUS							

Bits	Description	
[31:8]	Reserved	Reserved.
[7:0]	STATUS	<p>I²C Status</p> <p>The three least significant bits are always 0. The five most significant bits contain the status code. There are 28 possible status codes. When the content of I2C_STATUS0 is F8H, no serial interrupt is requested. Others I2C_STATUS0 values correspond to defined I²C states. When each of these states is entered, a status interrupt is requested (SI = 1). A valid status code is present in I2C_STATUS0 one cycle after SI is set by hardware and is still present one cycle after SI has been reset by software. In addition, states 00H stands for a Bus Error. A Bus Error occurs when a START or STOP condition is present at an illegal position in the formation frame. Example of illegal position are during the serial transfer of an address byte, a data byte or an acknowledge bit.</p>

I²C Clock Divided Register (I2C_CLKDIV)

BUSEN	SCTLOEN	SCTLOSTS	ALERTEN	BMHEN	BMDEN	PECEN	ACKMEN

Bits	Description
[31:14]	Reserved Reserved.
[13]	PECDIEN Packet Error Checking Byte Transfer Done Interrupt Enable Bit 0 = PEC transfer done interrupt Disabled. 1 = PEC transfer done interrupt Enabled. Note: This bit is used in PECEN =1.
[12]	BCDIEN Packet Error Checking Byte Count Done Interrupt Enable Bit 0 = Byte count done interrupt Disabled. 1 = Byte count done interrupt Enabled. Note: This bit is used in PECEN =1.
[11]	ACKM9SI Acknowledge Manual Enable Extra SI Interrupt 0 = There is no SI interrupt in the 9th clock cycle when the BUSEN =1 and ACKMEN =1. 1 = There is SI interrupt in the 9th clock cycle when the BUSEN =1 and ACKMEN =1.
[10]	PECCLR PEC Clear at Repeat The calculation of PEC starts when PECEN is set to 1 and it is cleared when the STA or STO bit is detected. This PECCLR bit used to enable the condition of Repeat START can clear the PEC calculation. 0 = PEC calculation is cleared by "Repeat START" function Disabled. 1 = PEC calculation is cleared by "Repeat START" function Enabled.
[9]	TIDLE Timer Check in Idle State The BUSTOUT is used to calculate the time-out of clock low in bus active and the idle period in bus Idle. This bit is used to define which condition is enabled. 0 = BUSTOUT is used to calculate the clock low period in bus active. 1 = BUSTOUT is used to calculate the IDLE period in bus Idle. Note: The BUSY (I2C_BUSSTS[0]) indicate the current bus state.
[8]	PECTXEN Packet Error Checking Byte Transmission/Reception 0 = No PEC transfer. 1 = PEC transmission is requested.

		Note: 1. This bit has no effect in slave mode when ACKMEN =0.
[7]	BUSEN	<p>BUS Enable Bit</p> <p>0 = The system management function Disabled. 1 = The system management function Enabled.</p> <p>Note: When the bit is enabled, the internal 14-bit counter is used to calculate the time out event of clock low condition.</p>
[6]	SCTLOEN	<p>Suspend or Control Pin Output Enable Bit</p> <p>0 = The SUSCON pin in input. 1 = The output enable is active on the SUSCON pin.</p>
[5]	SCTLOSTS	<p>Suspend/Control Data Output Status</p> <p>0 = The output of SUSCON pin is low. 1 = The output of SUSCON pin is high.</p>
[4]	ALERTEN	<p>Bus Management Alert Enable Bit</p> <p>Device Mode (BMHEN =0). 0 = Release the BM_ALERT pin high and Alert Response Header disabled: 0001100x followed by NACK if both of BMDEN and ACKMEN are enabled. 1 = Drive BM_ALERT pin low and Alert Response Address Header enables: 0001100x followed by ACK if both of BMDEN and ACKMEN are enabled.</p> <p>Host Mode (BMHEN =1). 0 = BM_ALERT pin not supported. 1 = BM_ALERT pin supported.</p>
[3]	BMHEN	<p>Bus Management Host Enable Bit</p> <p>0 = Host function Disabled. 1 = Host function Enabled.</p>
[2]	BMDEN	<p>Bus Management Device Default Address Enable Bit</p> <p>0 = Device default address Disable. When the address 0'b1100001x coming and the both of BMDEN and ACKMEN are enabled, the device responses NACKed 1 = Device default address Enabled. When the address 0'b1100001x coming and the both of BMDEN and ACKMEN are enabled, the device responses ACKed.</p>
[1]	PECEN	<p>Packet Error Checking Calculation Enable Bit</p> <p>0 = Packet Error Checking Calculation Disabled. 1 = Packet Error Checking Calculation Enabled.</p> <p>Note: When I²C enters Power-down mode, the bit should be enabled after wake-up if needed PEC calculation.</p>
[0]	ACKMEN	<p>Acknowledge Control by Manual</p> <p>In order to allow ACK control in slave reception including the command and data, slave byte control mode must be enabled by setting the ACKMEN bit.</p> <p>0 = Slave byte control Disabled. 1 = Slave byte control Enabled. The 9th bit can response the ACK or NACK according the received data by user. When the byte is received, stretching the SCLK signal low between the 8th and 9th SCLK pulse.</p> <p>Note: If the BMDEN =1 and this bit is enabled, the information of I2C_STATUS0 will be fixed as 0xF0 in slave receive condition.</p>

6.18 USCI - Universal Serial Control Interface Controller (USCI)

6.18.1 Overview

The Universal Serial Control Interface (USCI) is a flexible interface module covering several serial communication protocols. The user can configure this controller as UART, SPI, or I²C functional protocol.

6.18.2 Features

The controller can be individually configured to match the application needs. The following protocols are supported:

- UART
- SPI
- I²C

6.18.3 Block Diagram

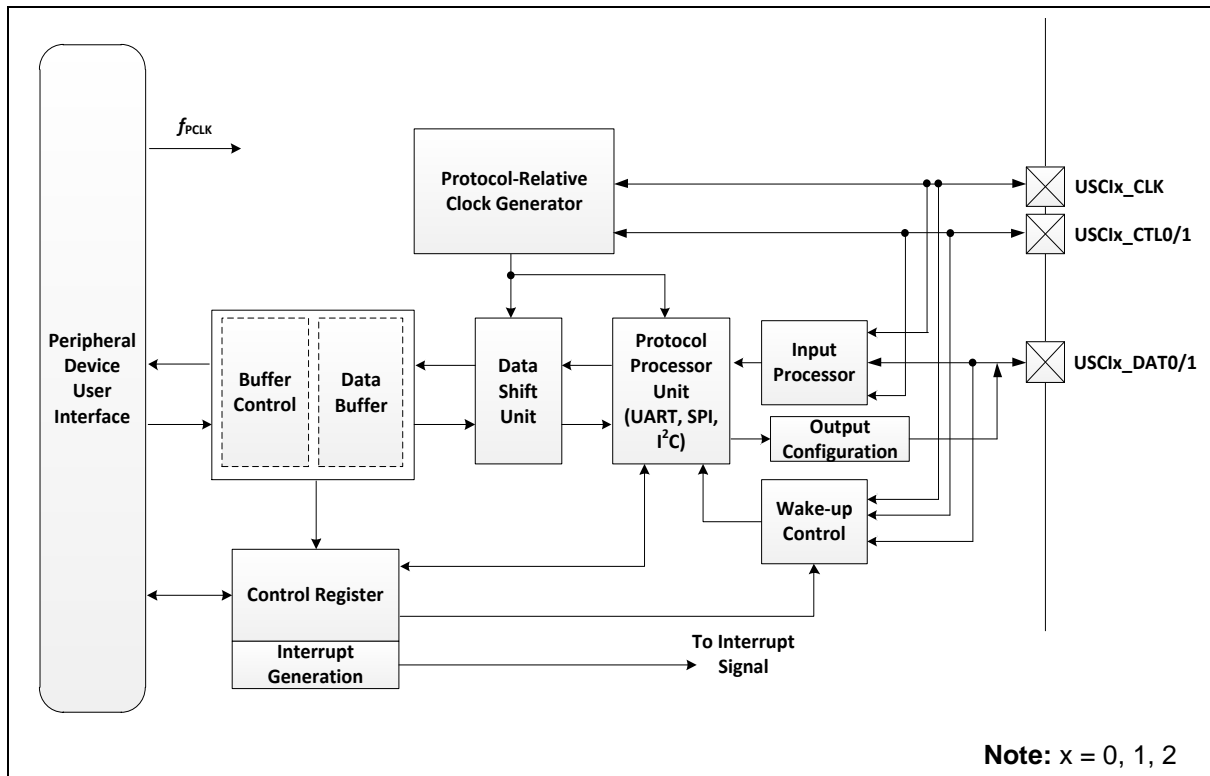

Figure 6.18-1 USCI Block Diagram

6.18.4 Functional Description

The structure of the Universal Serial Control Interface (USCI) controller is shown in Figure 6.18-1 USCI Block Diagram. The input signal is implemented in input processor. The data buffers and the data shift unit support the data transfers. Each protocol-specific function is handled by the protocol processor unit. The timing and time event control signals of the specific protocol are handled by the protocol-relative clock generator. All the protocol-specific events are processed in the interrupt generation unit. The wake-up function of the specific protocol is implemented in the wake-up control unit.

The USCI is equipped with three protocols including UART, SPI, and I²C. They can be selected by FUNMODE (USCI_CTL [2:0]). Note that the FUNMODE must be set to 0 before changing protocol.

6.18.4.1 I/O Processor

Input Signal

All input stages offer the similar feature set. They are used for all protocols.

Table 6.18-1 lists the relative input signals for each selected protocol. Each input signal is handled by an input processor for signal conditioning, such as signal inverse selection control, or a digital input filter.

Selected Protocol		UART	SPI	I ² C
Serial Bus Clock Input	USCIx_CLK	-	SPI_CLK	SCL
Control Input	USCIx_CTL0	nCTS	SPI_SS	-
	USCIx_CTL1	-	-	-
Data Input	USCIx_DAT0	RX	SPI_MOSI_0	SDA
	USCIx_DAT1	-	SPI_MISO_0	-

Table 6.18-1 Input Signals for Different Protocols

The description of protocol-specific items are given in the related protocol chapters.

General Input Structure

The input structures of data and control signals include inverter, digital filter and edge detection (data signal only).

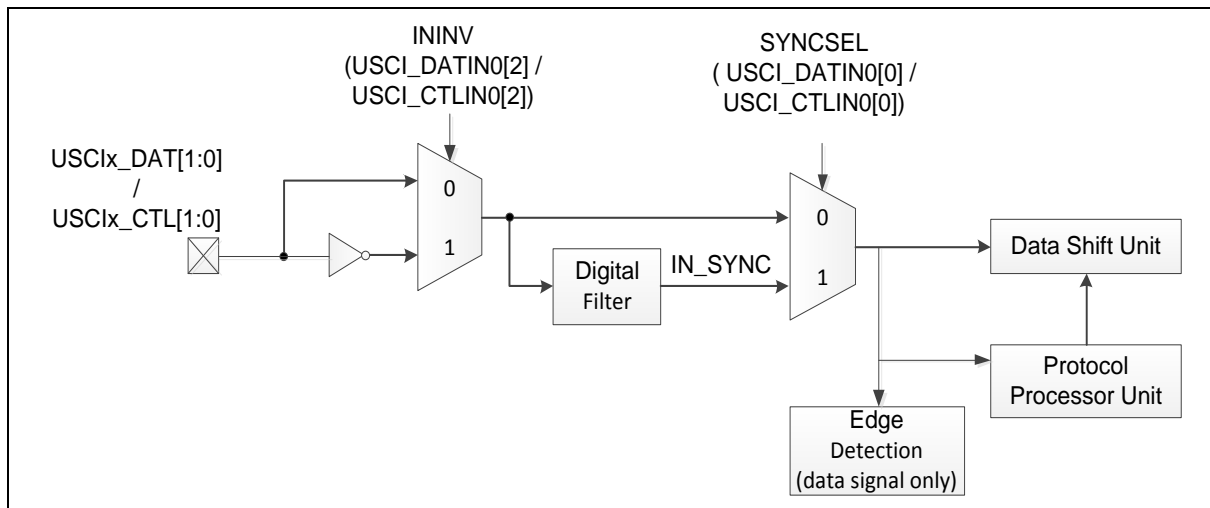

Figure 6.18-2 Input Conditioning for USCIx_DAT[1:0] and USCIx_CTL[1:0]

The input structure of USCIx_CLK is similar to USCIx_CTL[1:0] input structure, except it does not support inverse function.

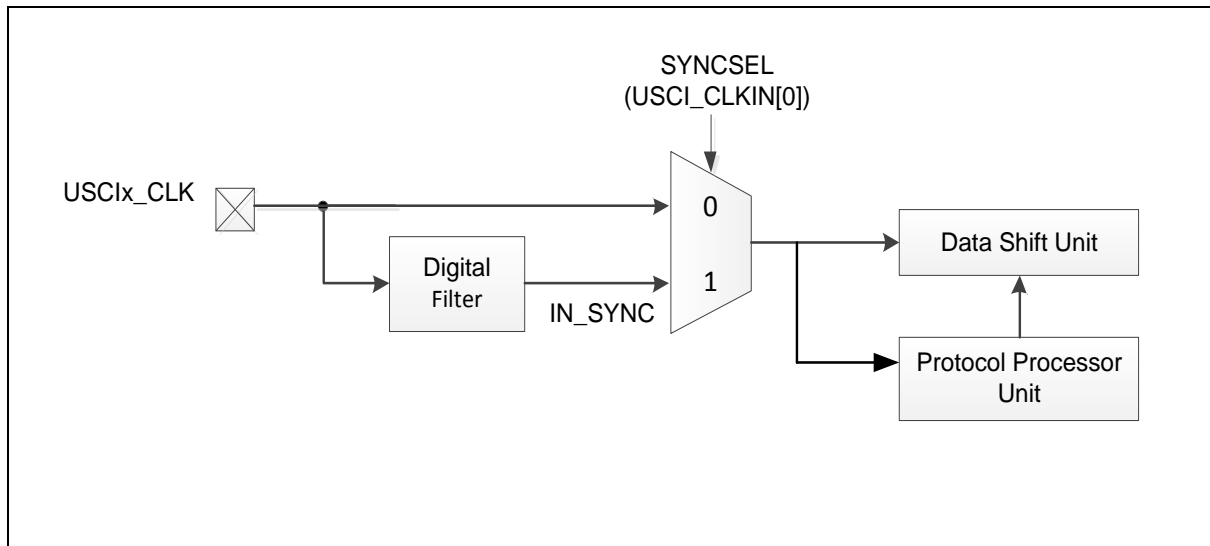

Figure 6.18-3 Input Conditioning for USCIX_CLK

All configurations of control, clock and data input structures are in USCI_CTLIN0, USCI_CLKIN and USCI_DATIN0 registers respectively. EDGEDET (USCI_DATIN0[4:3]) is used to select the edge detection condition. Note that the EDGEDET for USCI_DATIN0 must be set 2'b10 in UART mode. The programmable edge detection indicates that the desired event has occurred by activating the trigger signal.

ININV (USCI_DATIN0[2] / USCI_CTLIN0[2]) allows a polarity inversion of the selected input signal to adapt the input signal polarity to the internal polarity of the data shift unit and the protocol state machine.

If the SYNCSEL (USCI_DATIN0[0] / USCI_CTLIN0[0] / USCI_CLKIN[0]) is set to 0, the paths of input signals do not contain any delay due to synchronization or filtering. If there is noise on the input signals, the noise can be filtered from the input signal (signal IN_SYNC is synchronized to f_{PCLK}) when SYNCSEL is set to 1. The synchronization leads to a delay in the signal path of 2-3 times the period of f_{PCLK} .

Output Signals

Table 6.18-2 shows the relative output signals for each protocol. The number of actually used outputs depends on the selected protocol and they can be classified according to their meaning for the protocols.

Selected Protocol		UART	SPI	I ² C
Serial Bus Clock Output	USCIX_CLK	-	SPI_CLK	SCL
Control Output	USCIX_CTL0	-	SPI_SS	-
	USCIX_CTL1	nRTS	-	-
Data Output	USCIX_DAT0	-	SPI_MOSI_0	SDA
	USCIX_DAT1	TX	SPI_MISO_0	-

Table 6.18-2 Output Signals for Different Protocols

The description of protocol-specific items are given in the related protocol chapters.

6.18.4.2 Data Buffering

The data handling of the USCI controller is based on a Data Shift Unit (DSU) and a buffer structure. Both of the data shift and buffer registers are 16-bit wide. The inputs of Data Shift Unit include the shift data, the serial bus clock, and the shift control. The output pin of transmission can be USC1x_DAT0 pin or USC1x_DAT1 pin depends on what protocol is selected.

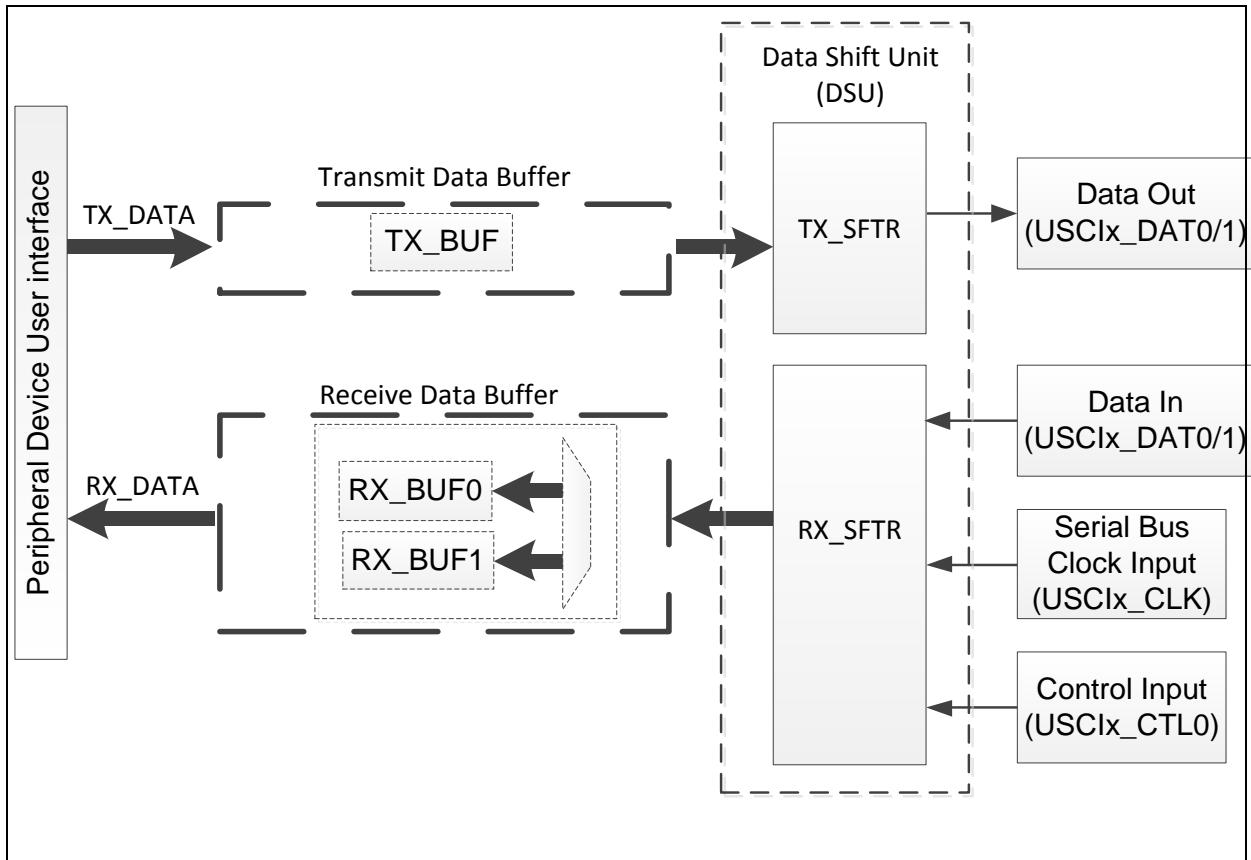

Figure 6.18-4 Block Diagram of Data Buffering

The operation of data handling includes:

- The peripheral device clock (PCLK) is used to handle data, status and control information.
- A transmitter includes transmit shift register (TX_SFTR) and a transmit data buffer (TX_BUF). The TXFULL / TXEMPTY (USCI_BUFSTS[9:8]) and TXENDIF (USCI_PROTSTS[2]) can indicate the status of transmitter.
- A receiver includes receive shift register (RX_SFTR) and a double receive buffer structure (RX_BUF0, RX_BUF1). In double buffer structure, user need not care about the reception sequence and two received data can be hold if user does not read the data of USCI_RXDAT register in time.

Data Access Structure

The Data Access Structure includes read access to received data and write access of data to be transmitted. The received data is stored in the receiver buffers including RX_BUF0 and RX_BUF1. User need not care about the reception sequence. The receive buffer can be accessed by reading USCI_RXDAT register. The first received data is read out first and the next received data becomes visible in USCI_RXDAT and can be read out next.

Transmit data can be loaded to TX_BUF by writing to the transmit register USCI_TXDAT.

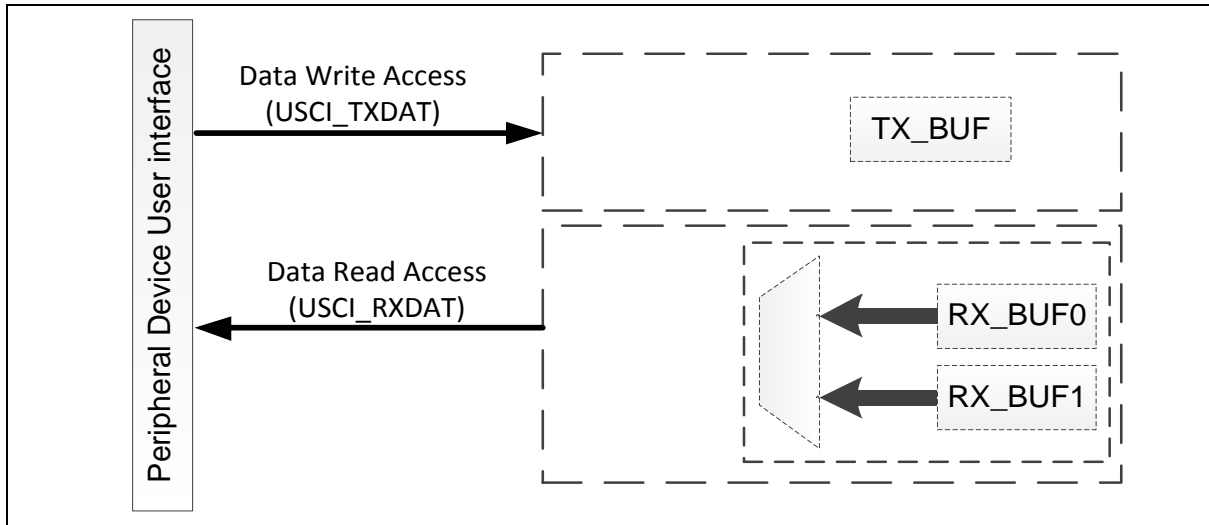

Figure 6.18-5 Data Access Structure

Transmit Data Path

The transmit data path is based on 16-bit wide transmit shift register (TX_SFTR) and transmit buffer TX_BUF. The data transfer parameters like data word length is controlled commonly for transmission and reception by the line control register USCI_LINECTL.

Transmit Buffering

The transmit shift register cannot be directly accessed by user. It is updated automatically with the value stored in the transmit buffer (TX_BUF) if a currently transmitted data is finished and new data is valid for transmission.

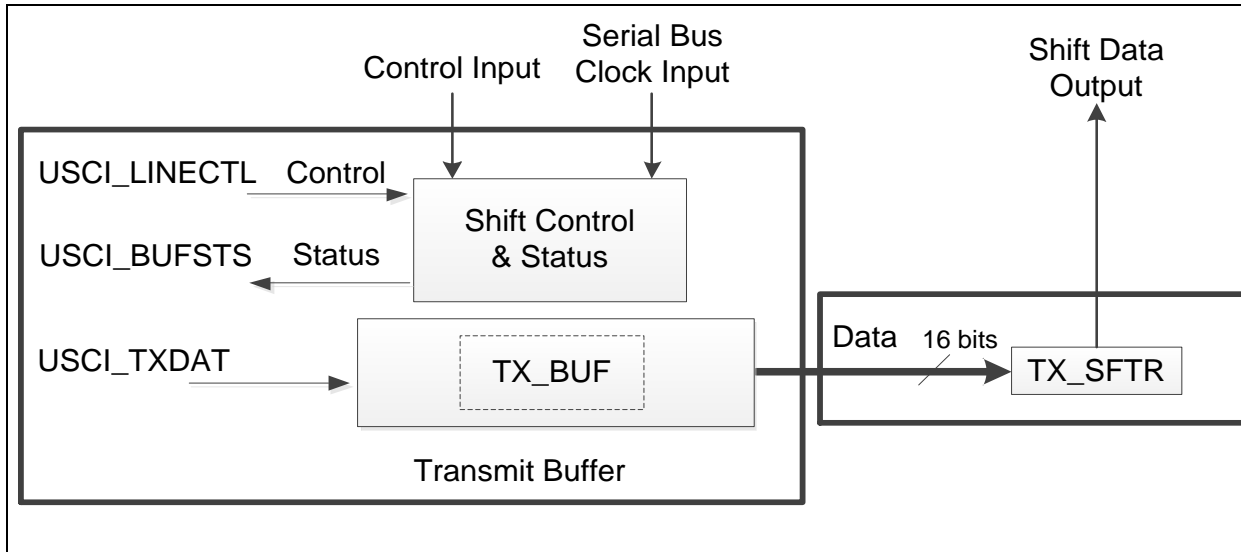

Figure 6.18-6 Transmit Data Path

Transmit Data Validation

The status of TXEMPTY (USCI_BUFSTS[8]) indicates the transmission data is valid or not in the transmit buffer (TX_BUF) and the TXSTIF (USCI_PROTSTS[1]) labels the start conditions for each data.

- If the USCI controller is a Master, the data transfer can only be started with valid data in the transmit buffer (TX_BUF). In this case, the transmit shift register is loaded with the content

of transmit buffer.

Note: Master defines the start of data transfer.

- If the USCI controller is a Slave, a data transfer requested by Master and it has to be started independently of the status in transmit buffer (TX_BUF). If a data transfer is requested and started by the Master, the transmit shift register is loaded from specific protocol control signal if it is valid for transmission.

Note: Slave can not define the start itself, but has to react.

- The timing of loading data from transmit buffer to data shift unit depends on protocol configurations.
- **UART:** A transmission of the data word in transmit buffer can be started if TXEMPTY = 0 in normal operation. In auto flow control, A transmission of the data word in transmit buffer can be started while TXEMPTY = 0 and USCIX_CTL0 in active stage.
- **SPI:** In Master mode, data transmission will be started when TXEMPTY is 0. In Slave mode, the data transmission can be started only when slave selection signal is at active state and clock is presented on USCIX_CLK pin.
- **I²C:** A transmission of the data byte in transmit buffer can be started if TXEMPTY = 0.
- A transmission data which is located in transmit buffer can be started if the TXEMPTY (USCI_BUFSTS [8]) = 0. The content of the transmit buffer (in TX_BUF condition) should not be overwritten with new data while it is valid for transmission and a new transmission can start. If the content of TX_BUF has to be changed, user can set TXRST (USCI_BUFCTL [16]) to 1 to clear the content of TX_BUF before updating the data. Moreover, TXEMPTY (USCI_BUFSTS [8]) will be cleared automatically when transmit buffer (TX_BUF) is updated with new data. While a transmission is in progress, TX_BUF can be loaded with new data. User has to update the TX_BUF before a new transmission.

Receive Data Path

The receive data path is based on 16-bit wide receive shift register RX_SFTR and receive buffers RX_BUF0 and RX_BUF1. The data transfer parameters like data word length, or the shift direction are controlled commonly for transmission and reception by the line control register USCI_LINECTL. Register USCI_BUFSTS monitors the data validation of USCI_RXDAT.

Receive Buffering

The receive shift register cannot be directly accessed by user, but its content is automatically loaded into the receive buffer if a complete data word has been received or the frame is finished. The received data words in Receive Buffer can be read out automatically from register USCI_RXDAT.

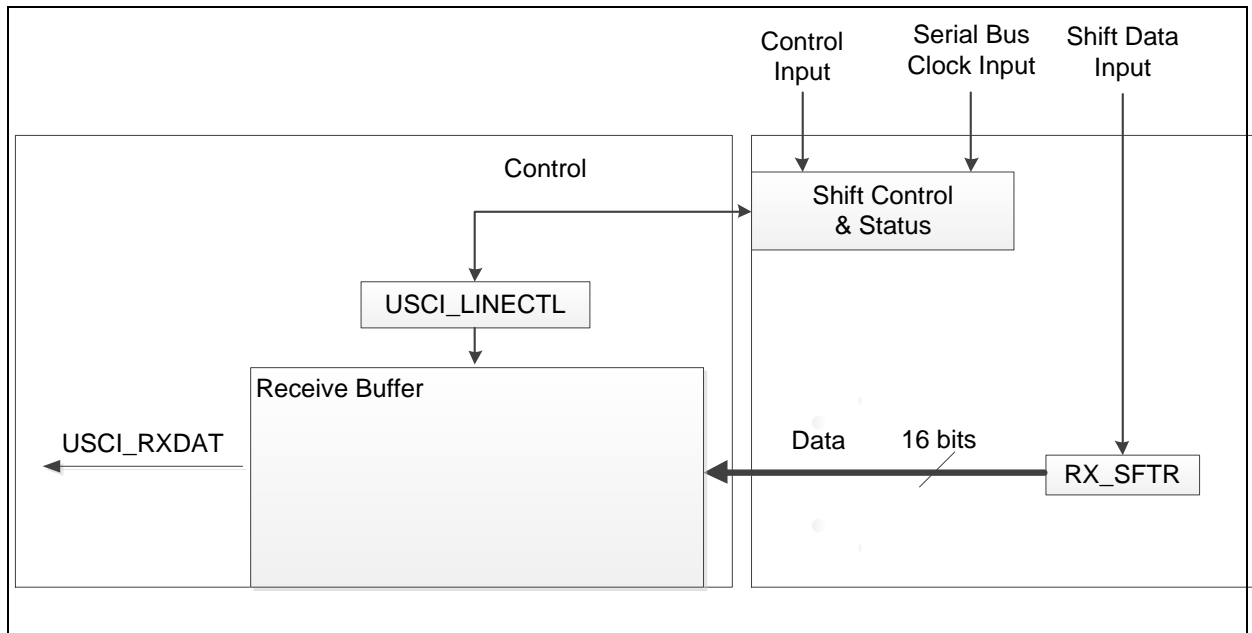

Figure 6.18-7 Receive Data Path

6.18.4.3 Port Direction Control

In SPI protocol with half-duplex configurations, the data port is bidirectional. Port direction control is intended to control the pin direction through a dedicated hardware interface.

The direction of selected pin is controlled by PORTDIR (USCI_TXDAT[16]). When user writes USCI_TXDAT register, the transmit data and its port direction are settled simultaneously.

6.18.4.4 Protocol Control and Status

The protocol-related control and status information are located in the protocol control register USCI_PROTCTL and in the protocol status register USCI_PROTSTS. These registers are shared between the available protocols. As a consequence, the meaning of the bit positions in these registers is different within the protocols. Refer to each protocol's relative register for detail information.

6.18.4.5 Protocol-Relative Clock Generator

The USCI controller contains a protocol-relative clock generator and it is controlled by register USCI_BRGEN. It is reset when the USCI_BRGEN register is written. The structured of protocol-relative clock generator is shown in Figure 6.18-8.

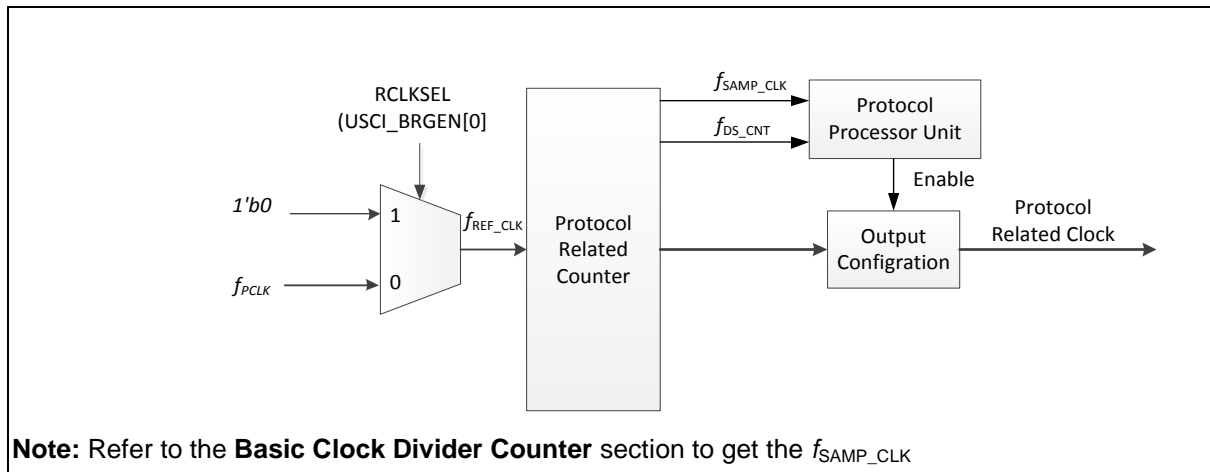

Figure 6.18-8 Protocol-Relative Clock Generator

The protocol related counter contains basic clock divider counter and timing measurement counter. It is based on a divider stages, providing the frequencies needed for the different protocols. It contains:

- The basic clock divider counter provides the protocol-relative clock signal and other protocol-related signals (f_{SAMP_CLK} and f_{DS_CLK}).
- The timing measurement counter for time interval measurement, e.g. baud rate detection on UART protocol.
- The output signals of protocol-relative clock generator can be made available on pins (e.g USC1x_CLK for SPI).

Basic Clock Divider Counter

The basic clock divider counter is used for an integer division delivering f_{REF_CLK2} , f_{REF_CLK} , f_{DIV_CLK} , f_{SCLK} , and f_{SAMP_CLK} . The frequencies of this divider are controlled by PTCLKSEL (USCI_BRGEN [1]), CLKDIV (USCI_BRGEN [25:16]), SPCLKSEL (USCI_BRGEN [3:2]).

The basic clock divider counter is used to generate the relative protocol timing signals.

$$f_{DIV_CLK} = f_{REF_CLK} \times \frac{1}{CLKDIV + 1} \text{ if PTCLKSEL} = 0$$

$$f_{DIV_CLK} = f_{REF_CLK} \times \frac{1}{(CLKDIV + 1) \times 2} \text{ if PTCLKSEL} = 1$$

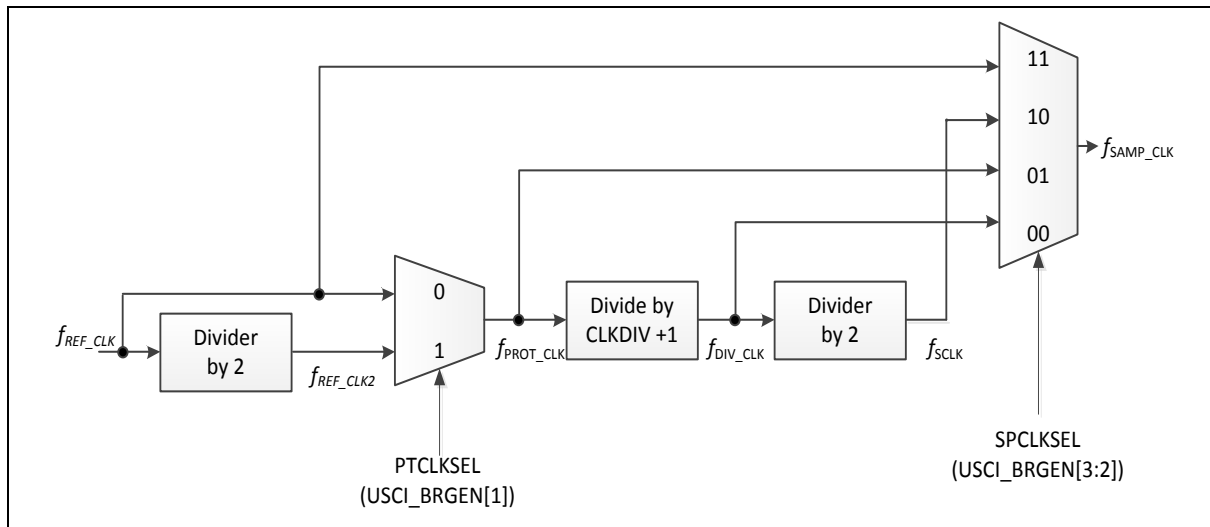

Figure 6.18-9 Basic Clock Divider Counter

Timing Measurement Counter

The timing measurement counter is used for time interval measurement and is enabled by TMCNTEN (USCI_BRGEN [4]) = 1. When TMCNTSRC (USCI_BRGEN [5]) is set to 1, the timer works on f_{DIV_CLK} , otherwise, the timer works independently from f_{PROT_CLK} . Therefore, any serial data reception or transmission can continue while the timer is performing timing measurements. The timer counts the length of protocol-related signals with f_{PROT_CLK} or f_{DIV_CLK} . It stops counting when it reaches the user-specified value.

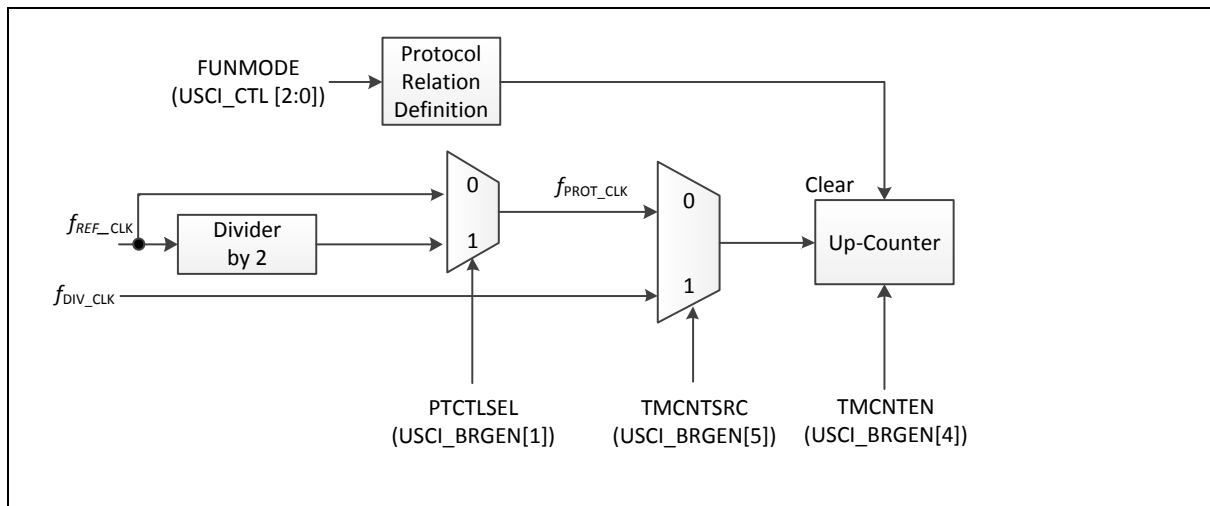

Figure 6.18-10 Block of Timing Measurement Counter

The timing measurement counter is used to perform time-out function or auto-baud rate mechanism. Its functionality depends on the selected protocol as shown below.

- UART: The timing measurement counter is used in auto baud rate detection.
- SPI: The timing measurement counter is used for counting the slave time-out period.
- I²C: The timing measurement counter indicates time-out clock cycle.

Sample Time Counter

A sample time counter associated to the protocol related counter defining protocol-specific timings, such

shift control signals or bit timings, based on the input frequency f_{SAMP_CLK} . The sample time counter allows generating time intervals for protocol-specific purposes. The period of a sample frequency f_{PDS_CNT} is given by the selected input frequency f_{SAMP_CLK} and the programmed pre-divider value (PDS_CNT (USCI_BRGEN [9:8])). The meaning of the sample time depends on the selected protocol. Please refer to the corresponding chapters for more protocol-specific information.

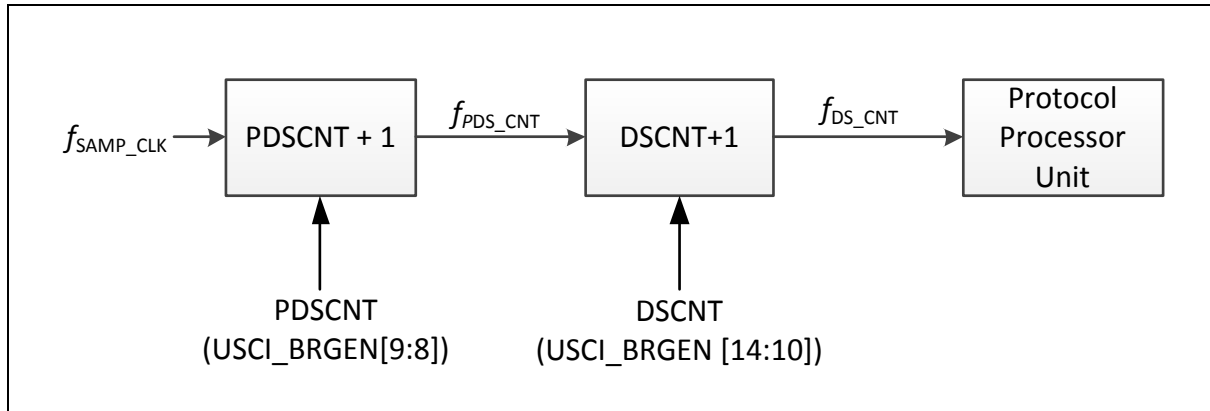

Figure 6.18-11 Sample Time Counter

6.18.4.6 Data Transfer Events and Interrupts

The data transfer events are based on the transmission or reception of a data word. The related indication flags are located in register USCI_PROTSTS. All events can be individually enabled for interrupt generation. If the FUNMODE (USCI_CTL [2:0]) is set to 0, the USCI is disabled. When FUNMODE (USCI_CTL [2:0]) is setting for a protocol port, the internal states will be controlled by logic hardware of the selected protocol.

- Transmit start interrupt event to indicate that a data word has been started:
A transmit start interrupt event occurs when the data is loaded into transmitted shift register. It is indicated by flag TXSTIF (USCI_PROTSTS [1]) and, if TXSTIEN (USCI_INTEN [1]) is enabled, it leads to transmit start interrupt.
- Transmit end interrupt event to indicate that a data word transmission has been done:
A transmit end interrupt event occurs when the current transmit data in shift register had been finished. It is indicated by flag TXENDIF (USCI_PROTSTS [2]) and, if TXENDIEN (USCI_INTEN [2]) is enabled, it leads to transmit end interrupt. This event also indicates when the shift control settings (word length, shift direction, etc.) are internally “frozen” for the current data word transmission. In UART and I²C mode, the transmit data is valid according to TXEMPTY (USCI_BUFSTS [8]) and protocol-relative internal signal with the transmit end interrupt event.
- Receiver start event to indicate that a data word reception has started:
When the receive clock edge that shifts in the first bit of a new data word is detected and reception is enabled, a receiver start event occurs. It is indicated by flag RXSTIF (USCI_PROTSTS [3]) and, if RXSTIEN (USCI_INTEN [3]) is enabled, it leads to receiver start interrupt.
- Receive event to indicate that a data word has been received:
If a new received word becomes available in the receive buffer, a receive event occurs. It is indicated by flag RXENDIF (USCI_PROTSTS [4]) and, if RXENDIEN (USCI_INTEN [4]) is enabled, it leads to receive interrupt.
- Data lost event to indicate a loss of the newest received data word:
If the data word available in register USCI_RXDAT (oldest data word from RX_BUF0 or

RX_BUF1) has not been read out and the receive buffer is FULL, the new incoming data will lose and this event occurs. It is indicated by flag RXOVIF (USCI_BUFSTS[3]) and, if RXOVIEN (USCI_BUFCTL[14]) is enabled, it leads to a protocol interrupt.

The general event and interrupt structure is shown in Figure 6.18-12.

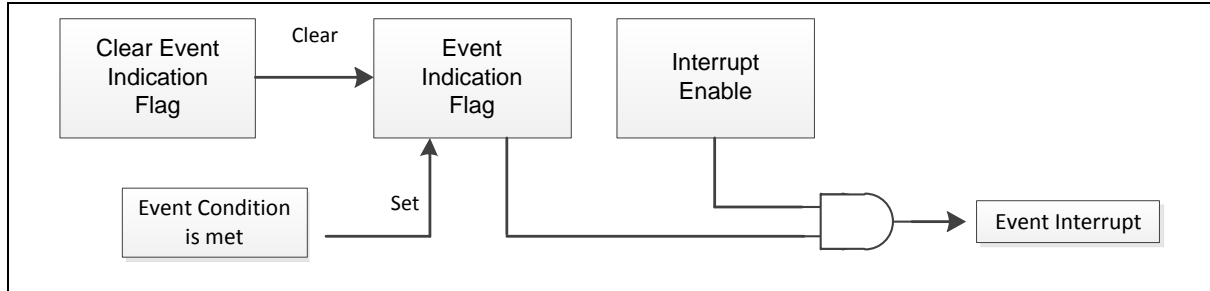

Figure 6.18-12 Event and Interrupt Structure

Each general interrupt enable can be set by RXENDIEN, RXSTIEN, TXENDIEN, and TXSTIEN of USCI_INTEN [4:1]. The events include receive end interrupt event, receive start interrupt event, transmit end interrupt event, and transmit start interrupt event. For protocol-specific interrupt, it is specified in each protocol interrupt enable register.

If a defined condition is met, an event is detected and an event indication flag becomes automatically set. The flag stays set until it is cleared by software. If enabled, an interrupt can be generated if an event is detected.

The registers, bits and bit fields indicate the data transfer events and control the general interrupts of a USCI are shown in Table 6.18-3.

Event	Indication Flag	Indication Cleared By	Interrupt Enabled By
Transmit start interrupt event	TXSTIF (USCI_PROTSTS [1])	It is cleared by software writes 1 to corresponding interrupt bit of USCI_PROTSTS.	TXSTIEN (USCI_INTEN [1])
Transmit end interrupt event	TXENDIF (USCI_PROTSTS [2])		TXENDIEN (USCI_INTEN [2])
Receive start interrupt event	RXSTIF (USCI_PROTSTS [3])		RXSTIEN (USCI_INTEN [3])
Receive end interrupt event	RXENDIF (USCI_PROTSTS [4])		RXENDIEN (USCI_INTEN [4])

Table 6.18-3 Data Transfer Events and Interrupt Handling

6.18.4.7 Protocol-specific Events and Interrupts

These events are related to protocol-specific actions that are described in the corresponding protocol chapters. The related indication flags are located in register USCI_PROTSTS. All events can be individually enabled for the generation of the common protocol interrupt.

Event	Indication Flag	Indication Cleared By	Interrupt Enabled By
Protocol-specific events in UART mode	USCI_PROTSTS [17:16] and USCI_PROTSTS [11:5]	It is cleared by software writes 1 to corresponding interrupt bit of USCI_PROTSTS.	USCI_PROTIEN[2:1]
Protocol-specific events in SPI mode	USCI_PROTSTS [9:8], USCI_PROTSTS [6:5]		USCI_PROTIEN [3:0]

Protocol-specific events in I ² C mode	USCI_PROTSTS [13:8], USCI_PROTSTS [5]		USCI_PROTIEN [6:0]
---	--	--	--------------------

Table 6.18-4 Protocol-specific Events and Interrupt Handling

6.18.4.8 *Wake-up*

The protocol-related wake-up functional information is located in the Wake-up Control Register (USCI_WKCTL) and in the Wake-up Status Register (USCI_WKSTS). These registers are shared between the available protocols. As a consequence, the meaning of the bit positions in these registers is different within the protocols.

6.18.4.9 *PDMA*

The USCI supports PDMA transfer function. When PDMAEN (USCI_PDMACTL [3]) is set to 1, the PDMA function is enabled.

When TXPDMAEN (USCI_PDMACTL [1]) is set to 1, the controller will issue request to PDMA controller to start the PDMA transmission process automatically.

When RXPDMAEN (USCI_PDMACTL [2]) is set to 1, the controller will start the PDMA reception process. USCI will issue request to PDMA controller automatically when there is data in the receive FIFO buffer.

In UART function, the requirement of RXPDMAEN will be cleared and hold if there is any error condition events including frame error, parity error or break detection. The user shall read out the current data and then the requirement of RXPDMAEN will send to the PDMA module in the next data.

6.19 USCI – UART Mode

6.19.1 Overview

The asynchronous serial channel UART covers the reception and the transmission of asynchronous data frames. It performs a serial-to-parallel conversion on data received from the peripheral, and a parallel-to-serial conversion on data transmitted from the controller. The receiver and transmitter being independent, frames can start at different points in time for transmission and reception.

The UART controller also provides auto flow control. There are three conditions to wake-up the system.

6.19.2 Features

- Supports one transmit buffer and two receive buffer for data payload
- Supports hardware auto flow control function
- Supports programmable baud-rate generator
- Support 9-bit Data Transfer (Support 9-bit RS-485)
- Baud rate detection possible by built-in capture event of baud rate generator
- Supports PDMA capability
- Supports Wake-up function (Data and nCTS Wakeup Only)

6.19.3 Block Diagram

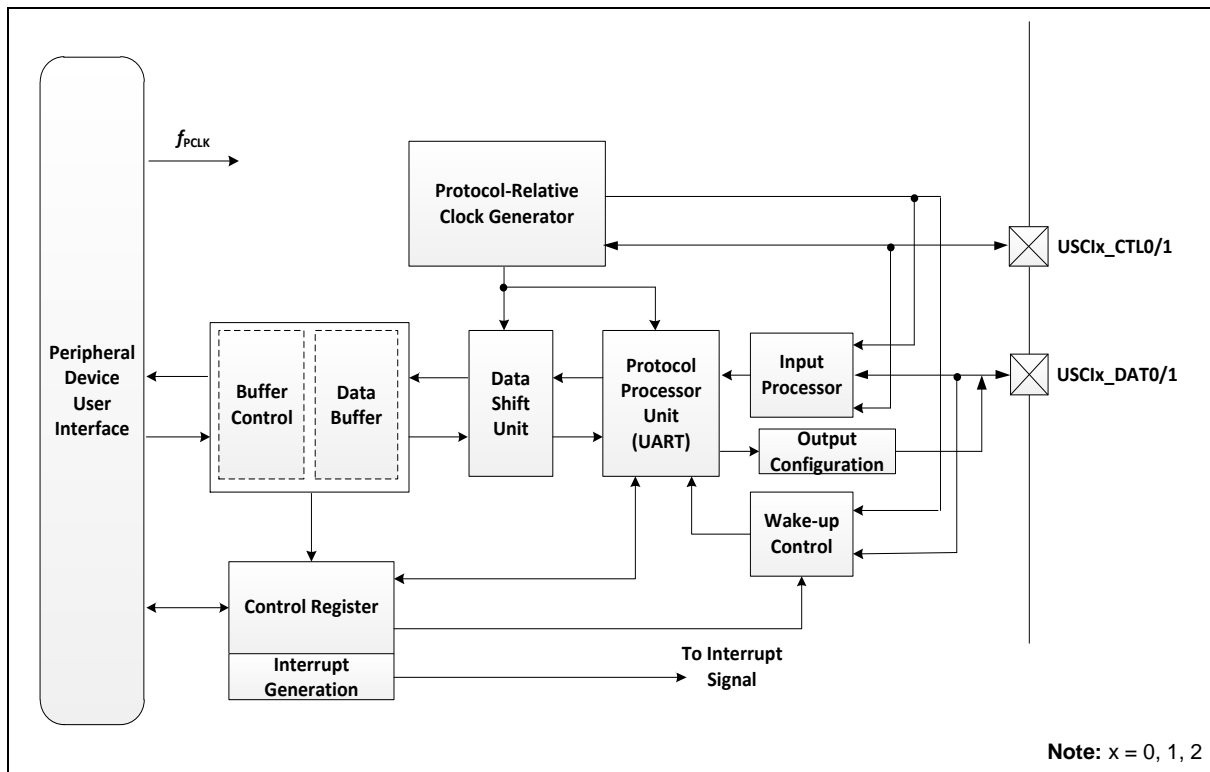

Figure 6.19-1 USCI-UART Mode Block Diagram

6.19.4 Basic Configuration

The basic configurations of USC10_UART are as follows:

- Clock Source Configuration
 - Enable USC10 peripheral clock in USC10CKEN (CLK_APBCLK1[8]).
 - Enable USC10_UART function UUART_CTL[2:0] register, UUART_CTL[2:0]=3'b010.
- Reset Configuration
 - Reset USC10 controller in USC10RST (SYS_IPRST2[8]).
- Pin Configuration

Group	Pin Name	GPIO	MFP
USC10	USC10_CTL0	PD.4	MFP3
		PC.14	MFP5
		PE.6	MFP7
	USC10_CTL1	PD.3	MFP3
		PB.15	MFP5
		PA.8	MFP6
		PE.5	MFP7

6.19.5 Functional Description

6.19.5.1 UART Common Function Description

Please refer to section USCI for detailed information.

6.19.5.2 Signal Description

An UART connection is characterized by the use of a single connection line between a transmitter and a receiver. The receiver input signal (RXD) is handled by the input stage USC1x_DAT0 and the transmit output (TXD) signal is handled by the output stage of USC1x_DAT1.

For full-duplex communication, an independent communication line is needed for each transfer direction. Figure 6.19-2 shows an example with a point-to-point full-duplex connection between two communication partners UART module A and UART module B.

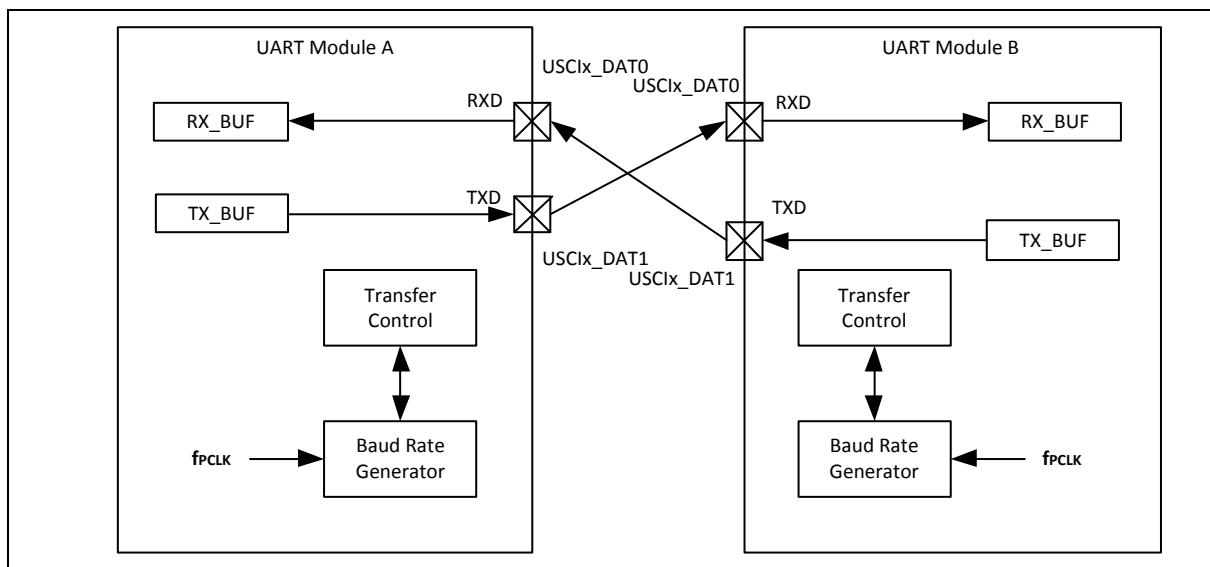

Figure 6.19-2 UART Signal Connection for Full-Duplex Communication

Input Signal

For UART protocol, the number of input signals is shown in Table 6.19-1. Each input signal is handled by an input processor for signal conditioning, such as signal inverse selection control, or a digital input filter. They can be classified according to their meaning for the protocols (see Table 6.19-1).

Selected Protocol		UART
Control Input	USC1x_CTL0	nCTS
	USC1x_CTL1	X
Data Input	USC1x_DAT0	RX
	USC1x_DAT1	X

Table 6.19-1 Input Signals for UART Protocol

Output Signals

For UART protocol, up to each protocol-related output signals are available. The number of actually used outputs depends on the selected protocol. They can be classified according to their meaning for the protocols.

Selected Protocol	UART
-------------------	------

Control Output	USCIx_CTL0	X
	USCIx_CTL1	nRTS
Data Output	USCIx_DAT0	X
	USCIx_DAT1	TX

Table 6.19-2 Output Signals for Different Protocol

6.19.5.3 Frame Format

A standard UART frame is shown in Figure 6.19-3. It consists of:

- An idle time with the signal level 1.
- One start of frame bit (SOF) with the signal level 0.
- 6~13 bit data
- A PARITY bit (P), programmable for either even or odd parity. It is optionally possible to handle frames without PARITY bit.
- One or two STOP bits with the signal level 1.

Figure 6.19-3 UART Standard Frame Format

The protocol specific bits (SOF, P, STOP) are automatically handled by the UART protocol state machine and do not appear in the data flow via the receive and transmit buffers.

Start Bit

The receiver input signal USCIx_DAT0 is checked for a falling edge. An SOF bit is detected when a falling edge occurs while the receiver is idle or after the sampling point of the last STOP bit. To increase noise immunity, the SOF bit timing starts with the first falling edge that is detected. If the sampled bit value of the SOF is 1, the previous falling edge is considered to be due to noise and the receiver is considered to be idle again.

Data Field

The length of the data field (number of data bits) can be programmed by the bit field of DWIDTH (UUART_LINECTL[11:8]). It can vary between 6 to 13 data bits.

Note: In UART protocol, the data transmission order is LSB first by setting LSB (UUART_LINECTL[0]) to 1.

Parity Bit

The UART allows parity generation for transmission and parity check for reception on frame base. The type of parity can be selected by bit field PARITYEN (UUART_PROTCTL[1]) and EVENPARITY (UUART_PROTCTL[2]), common for transmission and reception (no parity, even or odd parity). If the parity handling is disabled, the UART frame does not contain any PARITY bit. For consistency reasons, all communication partners have to be programmed to the same parity mode.

After the last data bit of the data field, the transmitter automatically sends out its calculated PARITY bit if parity generation has been enabled. The receiver interprets this bit as received parity and compares it to its internally calculated one. The result of the parity check and frame check (STOP bit) are monitored in the protocol status registers (UUART_PROTSTS). The register contains bits to monitor a protocol-

related status and protocol-related error indication (FRMERR, PARITYERR).

Stop Bit

Each UART frame is completed by 1 or 2 of STOP bits with the signal level 1 (same level as the idle level). The number of STOP bits is programmable by bit STOPB (UUART_PROTCTL[0]). A new START bit can be transferred directly after the last STOP bit.

Transfer Status Indication

RXBUSY (UUART_PROTSTS[10]) indicates the receiver status.

The receiver status can be monitored by RXBUSY bit. In this case, bit RXBUSY is set during a complete frame reception from the beginning of the start of frame bit to the end of the last STOP bit.

6.19.5.4 Operating Mode

To operate the UART protocol, the following issues have to be considered:

Select UART Mode

The UART protocol can be selected by setting FUNMODEOE (UUART_CTL[2:0]) to 010B and the UART protocol can be enabled by setting PROTEN (UUART_PROTCTL [31]) to 1. Note that the FUNMODE must be set 0 before protocol changing and it is recommended to configure all parameters of the UART before UART protocol is enabled.

Pin Connections

The USC1x_DAT0 pin is used for UART receive data input signal (RX) in UART protocol. The property of input data signal can be configured in UUART_DATIN0. It is suggested to set EDGEDET (UUART_DATIN0[4:3]) as 10B for START bit detection.

The USC1x_DAT1 pin is used for UART transmit data output signal (TX) in UART protocol. The property of output data signal can be configured in UUART_LINECTL.

The USC1x_CTL0 pin is used for UART clear to send signal (nCTS) in UART protocol. The property of input control signal can be configured in UUART_CTLIN0.

The USC1x_CTL1 pin is used for UART request to send signal (nRTS) in UART protocol. The property of output control signal can be configured in UUART_LINECTL.

Bit Timing Configuration

The desired baud rate setting has to be selected, comprising the baud rate generator and the bit timing.

Frame Format Configuration

The word length, the STOP bit number, and the parity mode has to be set up according to the application requirements by programming UUART_LINECTL and the UUART_PROTCTL register. If required by the application, the data input and output signals can be inverted. The data transmission order is LSB first by setting LSB (UUART_LINECTL[0]) to 1.

6.19.5.5 Bit Timing

In UART mode, each frame bit is divided into data sample time in order to provide granularity in the sub-bit range to adjust the sample point to the application requirements. The number of data sample time per bit is defined by bit fields DSCNT (UUART_BRGEN[14:10]) and the length of a data sample time is given by PDSCNT (UUART_BRGEN[9:8]).

In the example given in Figure 6.19-4, one bit time is composed of 16 data sample time DSCNT(UUART_BRGEN[14:10]) = 15. It is not recommended to program less and equal than 4 data sample time per bit time.

The position of the sampling point for the bit value is fixed in 1/2 samples time. It is possible to sample the bit value to take the average of samples.

The bit timing setup (number of data sample time) is common for the transmitter and the receiver because they use the same hardware circuit.

Figure 6.19-4 UART Bit Timing (data sample time)

6.19.5.6 Baud Rate Generation

The baud rate f_{UART} in UART mode depends on the number of data sample time per bit time and their timing. The baud rate setting should only be changed while the transmitter and the receiver are idle. The bits RCLKSEL, SPCLKSEL, PDSCNT, and DSCNT define the baud rate setting:

RCLKSEL (UART_BRGEN [0])

to define the input frequency f_{REF_CLK}

SPCLKSEL (UART_BRGEN[3:2])

to define the multiple source of the sample clock f_{SAMP_CLK}

PDSCNT (UART_BRGEN [9:8])

to define the length of a data sample time (division of f_{REF_CLK} by 1, 2, 3, or 4)

DSCNT (UART_BRGEN [14:10])

to define the number of data sample time per bit time

The standard setting is given by RCLKSEL = 0 ($f_{REF_CLK} = f_{PCLK}$), PTCLKSEL = 0 ($f_{PROT_CLK} = f_{REF_CLK}$) and SPCLKSEL = 2'b00 ($f_{SAMP_CLK} = f_{DIV_CLK}$). Under these conditions, the baud rate is given by:

$$f_{UART} = f_{REF_CLK} \times \frac{1}{CLKDIV + 1} \times \frac{1}{PDSCNT + 1} \times \frac{1}{DSCNT + 1}$$

In order to generate slower frequencies, additional divide-by-2 stages can be selected by PTCLKSEL = 1 ($f_{PROT_CLK} = f_{REF_CLK} / 2$), leading to:

$$f_{UART} = \frac{f_{REF_CLK}}{2} \times \frac{1}{CLKDIV + 1} \times \frac{1}{PDSCNT + 1} \times \frac{1}{DSCNT + 1}$$

If SPCLKSEL = 2'b10 ($f_{SAMP_CLK} = f_{SCLK}$), and RCLKSEL = 0 ($f_{REF_CLK} = f_{PCLK}$), PTCLKSEL = 0 ($f_{PROT_CLK} = f_{REF_CLK}$). The baud rate is given by:

$$f_{UART} = f_{REF_CLK} \times \frac{1}{CLKDIV + 1} \times \frac{1}{2} \times \frac{1}{PDSCNT + 1} \times \frac{1}{DSCNT + 1}$$

There is error tolerance for the UART baud rate after setting the baud rate parameter. Table 6.19-3 lists the relative error percentage examples for user to calculate his relative baud rate setting.

HCLK Source	PCLK Source	Expect Baud Rate	CLKDIV (UART_BRGEN[25:16])	DSCNT (UART_BRGEN[14:10])	PDSCNT	Active Baud Rate	Error Percentage
12 MHz	HCLK	115200	0xC	0x7	0x0	115384	0.16%
12 MHz	HCLK	9600	0x7C	0x9	0x0	9600	0%
12 MHz	HCLK	2400	0x1F3	0x9	0x0	2400	0%

Table 6.19-3 Baud Rate Relationship

Note: {SPCLKSEL, PTCLKSEL, RCLKSEL = 2'b0,1'b0,1'b0}

6.19.5.7 Auto Baud Rate Detection

The UART controller supports auto baud rate detection function. It is used to identify the input baud rate from the receiver signal (USCIx_DAT0) and then revised the baud rate clock divider CLKDIV (UUART_BRGEN[25:16]) after the baud rate function done to meet the detected baud rate information. According the section of Timing Measurement Counter, the timing measurement counter is used for time interval measurement of the input signal (USCIx_DAT0) and the actual timer value is captured into bit field BRDETIV (UUART_PROTCTL [24:16]) in each falling edge of the detected signal.

When the ABREN (UUART_PROTCTL[6]) bit is enabled, the 0x55 data patterns is necessary for auto baud rate detection. The falling edge of input signal starts the baud rate counter and it loads the timing measurement counter value into the BRDETIV (UUART_PROTCTL [24:16]) in the next falling edge. It is suggested to use the fDIV_CLK (TMCNTSRC (UUART_BRGENC[5]) =1) as the counter source.

The CLKDIV (UUART_BRGEN[25:16]) will be revised by BRDETIV (UUART_PROTCTL [25:16]) after the auto baud rate function done (the time of 4th falling edge of input signal). If the user want to receive the next successive frame correctly, it is better to set the value of CLKDIV (UUART_BRGEN[25:16]) and DSCNT (UUART_BRGEN[14:10]) as the same value (the value shall be among the rang of 0xF and 0x5 because the DSCNT is used to define the sample counter of each bit and the PDESCNT (UUART_BRGEN[9:8]) is 0x0.

During the auto baud rate detection, the ABRDETIF (UUART_PROTSTS[9]) and the BRDETIV (UUART_PROTCTL [24:16]) will be updated after each falling edge of input signal and the auto baud rate pattern, 0x55, won't be received into the receiver buffer after the frame done. The bit of ABREN will be cleared by hardware after the 4th falling edge of input signal is detected thus the user can read the status of ABREN to know the auto baud rate function is done or not.

If the CLKDIV and DSCNT are not set as the same value in calculation the auto baud rate function, the user shall calculate the proper average baud rate by the value of BRDETIV and CLKDIV after the auto baud rate function done.

If the baud rate of input signal is very slower and the bit time of timing measurement counter can't calculate the correct period of the input bit time, there is a ABERRSTS bit (UUART_PROTSTS[11]) to indicate the error information of the auto baud rate detection. At this time, the user shall revise the value of CLKDIV and require the Host device to send the 0x55 pattern again.

According the limitation of timing measurement counter, the maximum auto baud rate detection is 0x1FE for BRDETIV. The UART Auto Baud Rate Control is shown in Figure 6.19-5.

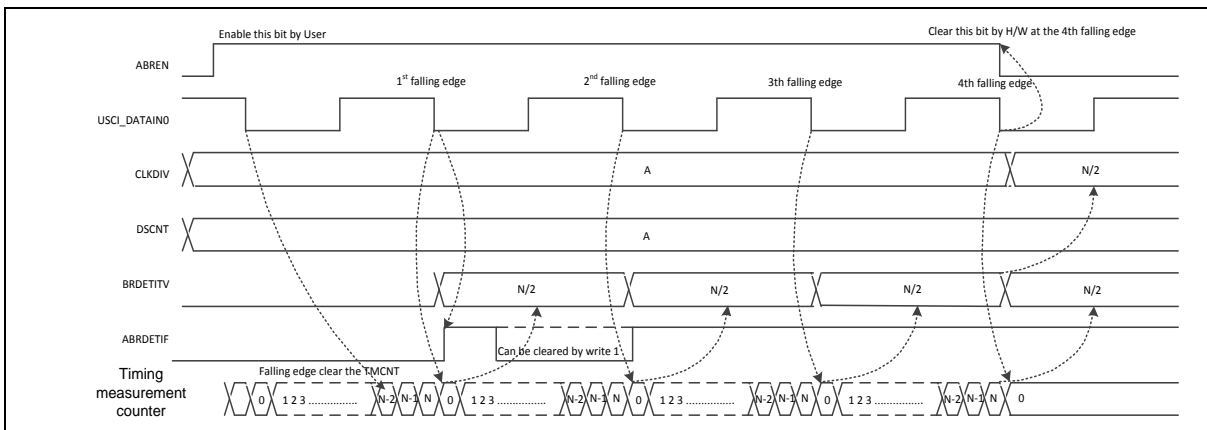

Figure 6.19-5 UART Auto Baud Rate Control

6.19.5.8 Auto Flow Control

The UART supports hardware auto-flow control that provides nRTS flow control by indicator RXFULL (UUART_BUFSTS[1]) on receiver buffer. When the buffer is full (RXFULL = 1), the nRTS is de-asserted.

The UART also provides nCTS flow control on transmitter. The nCTS is used to control the transmitted data is sent out when the nCTS is asserted.

6.19.5.9 RS-485 Support

The UART controller can play the role of the RS-485 master transmitter will identify an address character by setting the parity (9-th bit) to 1. For data characters, the parity is set to 0. Software can use the bit15 of each data to control the PARITY bit (PARITYEN (UUART_PROTCTL[1]) be set) when the STICKEN (UUART_PROTCTL[26]) is set. For example, if the STICKEN is set to 1 and data sequence are 0x8015, 0x8033, 0x0055, 0x0033 and 0x80AA the transmitted parity of data 0x15, 0x33, 0x55 0x33 and 0xAA will be 1, 1, 0, 0 and 1.

The UART controller can also play as an RS-485 addressable slave, the protocol-related error of PARITYERR (UUART_PROTSTS[5]) can be acted as the address bit detection when the PARITYEN (UUART_PROTCTL[1]), EVENPARITY (UUART_PROTCTL[2]) and STICKEN (UUART_PROTCTL[26]) were set. If the PARITYERR was set, it means that the address bit in the received bus is detected otherwise, the data is received into Buffer.

6.19.5.10 Wake-up Function

The USCI Controller in UART mode supports wake-up system function. The wake-up source includes incoming data and nCTS pin. Each wake-up source description is as follows:

- Incoming data wake-up

When system is in power-down and both of the WKEN (UUART_WKCTL [0]) and DATWKEN (UUART_PROTCTL[9]) are set, the toggle of incoming data pin can wake-up the system. In order to receive the incoming data after the system wake-up, the WAKECNT (UUART_PROTCTL[14:11]) shall be set. These bits field of WAKECNT (UUART_PROTCTL[14:11]) indicate how many clock cycle selected by fPDS_CNT do the controller can get the 1st bit (START bit) when the device is wakeup from Power-down mode. The incoming data wake-wp is shown in Figure 6.19-6.

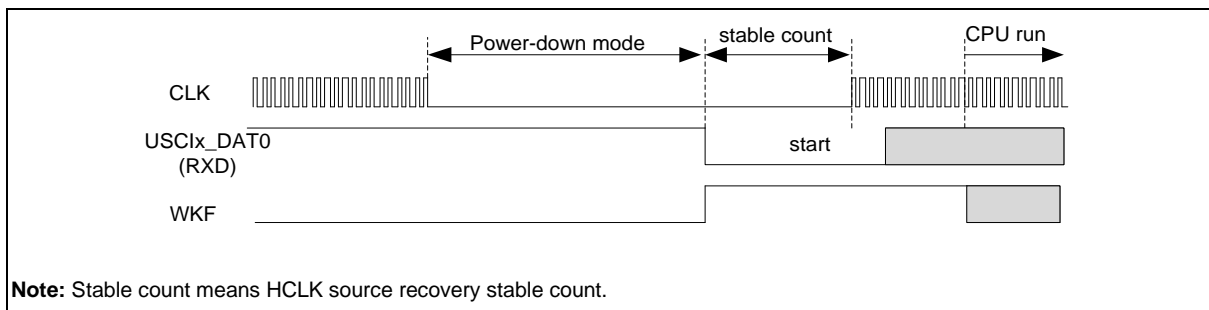

Figure 6.19-6 Incoming Data Wake-Up

- nCTS pin wake-up

When system is in power-down and both of the WKEN (UUART_WKCTL [0]) and CTSWKEN (UUART_PROTCTL[10]) are set, the toggle of nCTS pin can wake-up the system. The nCTS wake-wp is shown in Figure 6.19-7 and Figure 6.19-8.

Case 1(nCTS transition from low to high):

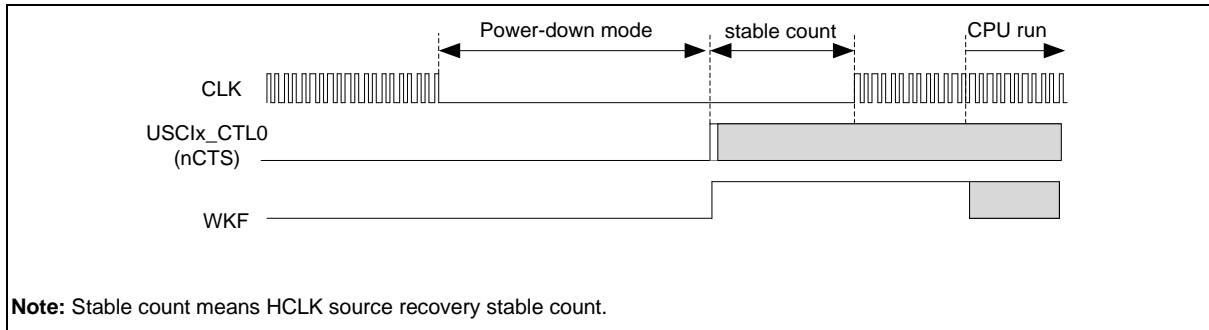

Figure 6.19-7 nCTS Wake-Up Case 1

Case 2 (nCTS transition from high to low):

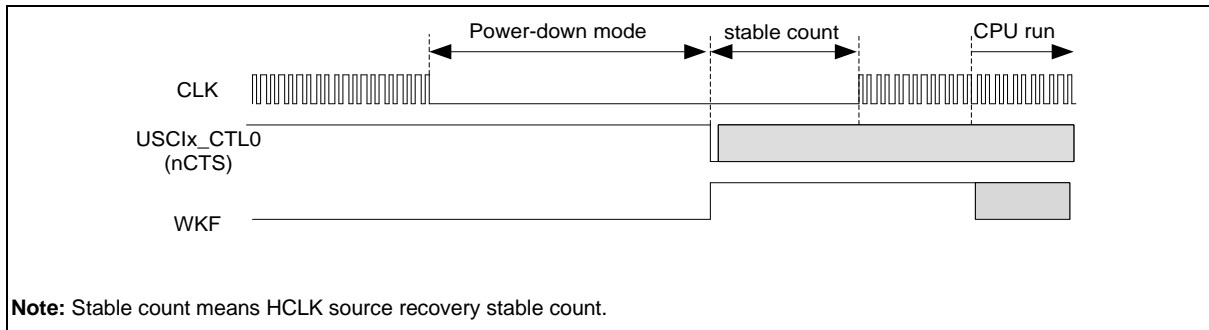

Figure 6.19-8 nCTS Wake-Up Case 2

6.19.5.11 Interrupt Events

The UART provided interrupt for protocol event and data transfer event. The description show below:

Protocol Interrupt Events

The following protocol-related events are generated in UART mode and can lead to a protocol interrupt.

Please note that the bits in register UUART_PROTSTS are not automatically cleared by hardware and have to be cleared by software in order to monitor new incoming events.

Receiver Line Status

The protocol-related error FRMERR (UUART_PROTSTS[6]) or PARITYERR (UUART_PROTSTS[5]) are two flags that are assigned to each received data word in the corresponding receiver buffer status registers.

In UART mode, the result of the parity check by the protocol-related error indication (0 = received PARITY bit equal to calculated parity value), and the result of frame check by the protocol-related error indication (0 = received STOP bit equal to the format value '1'). This information is elaborated for each data frame.

The break error flag BREAK (UUART_PROTSTS[7]) is assigned when the receive data is 0, the received parity and the STOP bit are also 0.

The interrupt indicates that there are parity error, frame error or the break data detection in the BREAK, FRMERR, PARITYERR (UUART_PROTSTS[7:5]) bits.

Auto Baud Rate Detection

The auto baud rate interrupt, ABRDETIF (UUART_PROTSTS [9]), indicates that the timing measurement counter has getting 2-bit duration for auto baud rate capture function.

The auto baud rate detection function will be enabled in the first falling edge of receiver signal. The auto baud rate detection function is measurement after the next following falling is detected and it is finished when the frame transfer done. After the transfer done, the timing measurement counter value divided by

twice is equal to the number of sample time per bit. The user can read the value of BRDETIV (UUART_PROTCTL[24:16]) and write into the baud rate generator register CLKDIV (UUART_BRGEN[25:16]).

Data Transfer Interrupt Handling

The data transfer interrupts indicate events related to UART frame handling.

Transmit Start Interrupt

Bit TXSTIF (UUART_PROTSTS [1]) is set after the START bit of a data word. In buffer mode, this is the earliest point in time when a new data word can be written to UUART_TXDAT.

Transmitter Finished

This interrupt indicates that the transmitter has completely finished all data in the buffer. Bit TXENDIF (UUART_PROTSTS [2]) becomes set at the end of the last STOP bit.

Receiver Starts Interrupt

Bit RXSTIF (UUART_PROTSTS [3]) is set after the sample point of the START bit.

Receiver Frame Finished

This interrupt indicates that the receiver has completely finished a frame. Bit RXENDIF (UUART_PROTSTS [4]) becomes set at the end of the last receive bit.

6.19.5.12 Programming Example

The following steps are used to configure the UART protocol setting and the data transmission.

1. Set FUNMODE (UUART_CTL[2:0]) to 0x2 to select UART protocol.
2. Write baud rate generator register UUART_BRGEN to select desired baud rate.
 - Set SPCLKSEL (UUART_BRGEN[3:2]), PTCLKSEL (UUART_BRGEN[1]) and RCLKSEL (UUART_BRGEN[0]) to select the clock source.
 - Configure CLKDIV (UUART_BRGEN[25:16]), DSCNT (UUART_BRGEN[14:10]) and
 - PDSCNT (UUART_BRGEN[9:8]) to determine the baud rate divider.
3. Write line control register UUART_LINECTL and protocol control register UUART_PROTCTL to configure the transmission data format and UART protocol setting.
 - Program data field length in DWIDTH (UUART_LINECTL[11:8]).
 - Enable PARITY bit and determine the PARITY bit type by setting EVENPARITY (UUART_PROTCTL[2]) and PARITYEN (UUART_PROTCTL[1]).
 - Configure STOP bit length by setting STOPB (UUART_PROTCTL[0]).
 - Enable LSB (UUART_LINECTL[0]) to select LSB first transmission for UART protocol.
- Set EDGEDET (UUART_DATIN0[4:3]) to “10” to select the detected edge as falling edge for receiver START bit detection.
4. Set PROTEN (UUART_PROTCTL[31]) to 1 to enable UART protocol.
5. Transmit and receive data.
 - Write transmit data register UUART_TXDAT to transmit data.
 - Wait until TXSTIF(UUART_PROTSTS[1]) is set and then user can write the next data in UUART_TXDAT.
 - When TXENDIF(UUART_PROTSTS[2]) is set, the transmit buffer is empty and the STOP bit of the last data has been transmitted.
 - If RXENDIF(UUART_PROTSTS[4]) is set, the receiver has finished a data frame completely. User can get the data by reading receive data register UUART_RXDAT.

6.19.6 Register Map

R: read only, W: write only, R/W: both read and write

Bits	Description	
[31]	PROTEN	UART Protocol Enable Bit 0 = UART Protocol Disabled. 1 = UART Protocol Enabled.
[30]	Reserved	Reserved.
[29]	BCEN	Transmit Break Control Enable Bit 0 = Transmit Break Control Disabled. 1 = Transmit Break Control Enabled. Note: When this bit is set to logic 1, the serial data output (TX) is forced to the Spacing State (logic 0). This bit acts only on TX line and has no effect on the transmitter logic.
[27]	Reserved	Reserved.
[26]	STICKEN	Stick Parity Enable Bit 0 = Stick parity Disabled. 1 = Stick parity Enabled. Note: Refer to RS-485 Support section for detailed information.
[25]	Reserved	Reserved.
[24:16]	BRDETIV	Baud Rate Detection Interval This bit fields indicate how many clock cycle selected by TMCNTSRC (UART_BRGEN [5]) does the slave calculates the baud rate in one bits. The order of the bus shall be 1 and 0 step by step (e.g. the input data pattern shall be 0x55). The user can read the value to know the current input baud rate of the bus whenever the ABRDETIF (UART_PROTCTL[9]) is set. Note: This bit can be cleared to 0 by software writing '0' to the BRDETIV.
[15]	Reserved	Reserved.
[14:11]	WAKECNT	Wake-up Counter These bits field indicate how many clock cycle selected by fPDS_CNT do the slave can get the 1 st bit (START bit) when the device is woken up from Power-down mode.
[10]	CTSWKEN	nCTS Wake-up Mode Enable Bit

		0 = nCTS wake-up mode Disabled. 1 = nCTS wake-up mode Enabled.
[9]	DATWKEN	Data Wake-up Mode Enable Bit 0 = Data wake-up mode Disabled. 1 = Data wake-up mode Enabled.
[6]	ABREN	Auto-baud Rate Detect Enable Bit 0 = Auto-baud rate detect function Disabled. 1 = Auto-baud rate detect function Enabled. Note: When the auto - baud rate detect operation finishes, hardware will clear this bit. The associated interrupt ABRDETIF (UUART_PROTSTS[9]) will be generated (If ARBIEN (UUART_PROTIEN [1]) is enabled).
[5]	RTSAUDIREN	nRTS Auto Direction Enable Bit When nRTS auto direction is enabled, if the transmitted bytes in the TX buffer is empty, the UART asserted nRTS signal automatically. 0 = nRTS auto direction control Disabled. 1 = nRTS auto direction control Enabled. Note 1: This bit is used for nRTS auto direction control for RS485. Note 2: This bit has effect only when the RTSAUTOEN is not set.
[4]	CTSAUTOEN	nCTS Auto-flow Control Enable Bit When nCTS auto-flow is enabled, the UART will send data to external device when nCTS input assert (UART will not send data to device if nCTS input is dis-asserted). 0 = nCTS auto-flow control Disabled. 1 = nCTS auto-flow control Enabled.
[3]	RTSAUTOEN	nRTS Auto-flow Control Enable Bit When nRTS auto-flow is enabled, if the receiver buffer is full (RXFULL (UUART_BUFSTS[1] =1), the UART will de-assert nRTS signal. 0 = nRTS auto-flow control Disabled. 1 = nRTS auto-flow control Enabled. Note: This bit has effect only when the RTSAUDIREN is not set.
[2]	EVENPARITY	Even Parity Enable Bit 0 = Odd number of logic 1's is transmitted and checked in each word. 1 = Even number of logic 1's is transmitted and checked in each word. Note: This bit has effect only when PARITYEN is set.
[1]	PARITYEN	Parity Enable Bit This bit defines the PARITY bit is enabled in an UART frame. 0 = The PARITY bit Disabled. 1 = The PARITY bit Enabled.
[0]	STOPB	STOP Bits This bit defines the number of STOP bits in an UART frame. 0 = The number of STOP bits is 1. 1 = The number of STOP bits is 2.

BREAK	FRMERR	PARITYERR	RXENDIF	RXSTIF	TXENDIF	TXSTIF	Reserved

Bits	Description	Description
[31:18]	Reserved	Reserved.
[17]	CTSLV	nCTS Pin Status (Read Only) This bit used to monitor the current status of nCTS pin input. 0 = nCTS pin input is low level voltage logic state. 1 = nCTS pin input is high level voltage logic state.
[16]	CTSSYNCLV	nCTS Synchronized Level Status (Read Only) This bit used to indicate the current status of the internal synchronized nCTS signal. 0 = The internal synchronized nCTS is low. 1 = The internal synchronized nCTS is high.
[15:12]	Reserved	Reserved.
[11]	ABERRSTS	Auto-baud Rate Error Status This bit is set when auto-baud rate detection counter overrun. When the auto-baud rate counter overrun, the user shall revise the CLKDIV (UUART_BRGEN[25:16]) value and enable ABREN (UUART_PROTCTL[6]) to detect the correct baud rate again. 0 = Auto-baud rate detect counter is not overrun. 1 = Auto-baud rate detect counter is overrun. Note 1: This bit is set at the same time of ABRDETIF. Note 2: This bit can be cleared by writing "1" to ABRDETIF or ABERRSTS.
[10]	RXBUSY	RX Bus Status Flag (Read Only) This bit indicates the busy status of the receiver. 0 = The receiver is Idle. 1 = The receiver is BUSY.
[9]	ABRDETIF	Auto-baud Rate Interrupt Flag This bit is set when auto-baud rate detection is done among the falling edge of the input data. If the ABRIEN (UUART_PROTCTL[6]) is set, the auto-baud rate interrupt will be generated. This bit can be set 4 times when the input data pattern is 0x55 and it is cleared before the next falling edge of the input bus.

		<p>0 = Auto-baud rate detect function is not done. 1 = One Bit auto-baud rate detect function is done. Note: This bit can be cleared by writing "1" to it.</p>
[8]	Reserved	Reserved.
[7]	BREAK	<p>Break Flag This bit is set to logic 1 whenever the received data input (RX) is held in the "spacing state" (logic 0) for longer than a full word transmission time (that is, the total time of "START bit" + data bits + parity + STOP bits). 0 = No Break is generated. 1 = Break is generated in the receiver bus. Note: This bit can be cleared by writing "1" among the BREAK, FRMERR and PARITYERR bits.</p>
[6]	FRMERR	<p>Framing Error Flag This bit is set to logic 1 whenever the received character does not have a valid "STOP bit" (that is, the STOP bit following the last data bit or PARITY bit is detected as logic 0). 0 = No framing error is generated. 1 = Framing error is generated. Note: This bit can be cleared by writing "1" among the BREAK, FRMERR and PARITYERR bits.</p>
[5]	PARITYERR	<p>Parity Error Flag This bit is set to logic 1 whenever the received character does not have a valid "PARITY bit". 0 = No parity error is generated. 1 = Parity error is generated. Note: This bit can be cleared by writing "1" among the BREAK, FRMERR and PARITYERR bits.</p>
[4]	RXENDIF	<p>Receive End Interrupt Flag 0 = A receive finish interrupt status has not occurred. 1 = A receive finish interrupt status has occurred. Note: It is cleared by software writing 1 into this bit.</p>
[3]	RXSTIF	<p>Receive Start Interrupt Flag 0 = A receive start interrupt status has not occurred. 1 = A receive start interrupt status has occurred. Note: It is cleared by software writing 1 into this bit.</p>
[2]	TXENDIF	<p>Transmit End Interrupt Flag 0 = A transmit end interrupt status has not occurred. 1 = A transmit end interrupt status has occurred. Note: It is cleared by software writing 1 into this bit.</p>
[1]	TXSTIF	<p>Transmit Start Interrupt Flag 0 = A transmit start interrupt status has not occurred. 1 = A transmit start interrupt status has occurred. Note 1: It is cleared by software writing one into this bit. Note 2: Used for user to load next transmit data when there is no data in transmit buffer.</p>
[0]	Reserved	Reserved.

6.20 USCI - SPI Mode

6.20.1 Overview

The SPI protocol of USCI controller applies to synchronous serial data communication and allows full duplex transfer. It supports both master and Slave operation mode with the 4-wire bi-direction interface. SPI mode of USCI controller performs a serial-to-parallel conversion on data received from a peripheral device, and a parallel-to-serial conversion on data transmitted to a peripheral device. The SPI mode is selected by FUNMODE (USPI_CTL[2:0]) = 0x1

This SPI protocol can operate as master or Slave mode by setting the SLAVE (USPI_PROTCTL[0]) to communicate with the off-chip SPI Slave or master device. The application block diagrams in master and Slave mode are shown below.

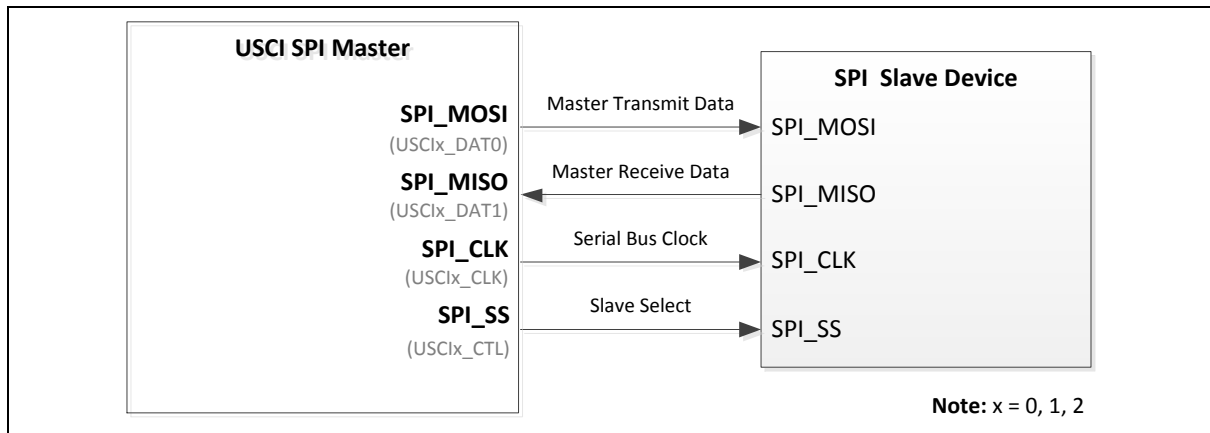

Figure 6.20-1 SPI Master Mode Application Block Diagram

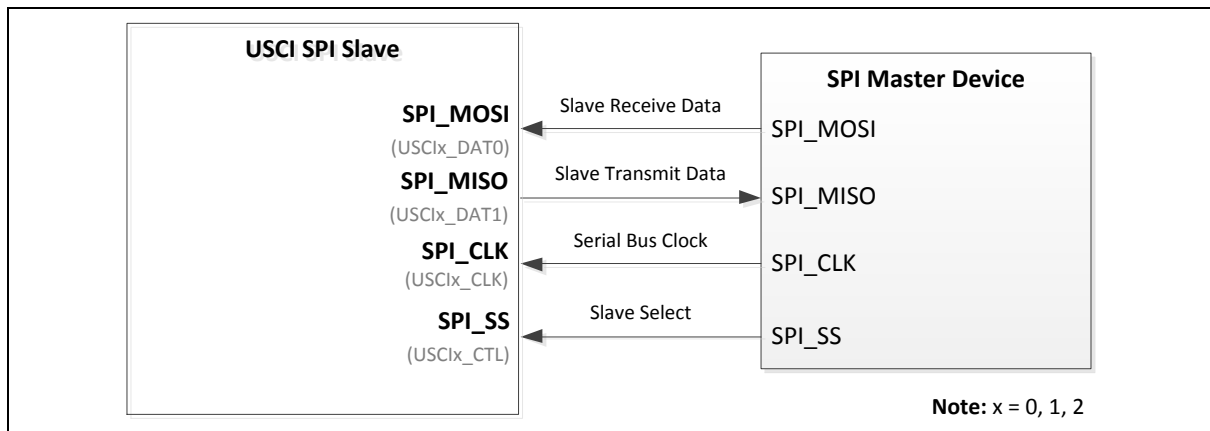

Figure 6.20-2 SPI Slave Mode Application Block Diagram

6.20.2 Features

- Configurable bit length of a transfer word from 4 to 16-bit
- Supports one transmit buffer and two receive buffers for data payload
- Supports MSB first or LSB first transfer sequence
- Supports Word Suspend function
- Supports PDMA transfer

- Supports 3-wire, no slave select signal, bi-direction interface
- Supports wake-up function by slave select signal in Slave mode
- Supports one data channel half-duplex transfer

6.20.3 Block Diagram

6.20.5 Functional Description

6.20.5.1 USPI Common Function Description

Please refer to section USCI for detailed information.

6.20.5.2 Signal Description

A device operating in Master mode controls the start and end of a data transfer, as well as the generation of the SPI bus clock and slave select signal. The slave select signal indicates the start and the end of a data transfer, and the master device can use it to enable the transmitting or receiving operations of Slave device. Slave device receives the SPI bus clock and optionally a slave select signal for data transaction. The signals for SPI communication are shown in Table 6.20-1.

SPI Mode	Receive Data	Transmit Data	Serial Bus Clock	Slave Select
Full-duplex SPI Master	SPI_MISO (USCIx_DAT1)	SPI_MOSI (USCIx_DAT0)	SPI_CLK (USCIx_CLK)	SPI_SS (USCIx_CTL0)
Full-duplex SPI Slave	SPI_MOSI (USCIx_DAT0)	SPI_MISO (USCIx_DAT1)	SPI_CLK (USCIx_CLK)	SPI_SS (USCIx_CTL0)
Half-duplex SPI Master/Slave	SPI_MOSI (USCIx_DAT0)	SPI_MOSI (USCIx_DAT0)	SPI_CLK (USCIx_CLK)	SPI_SS (USCIx_CTL0)

Table 6.20-1 Signals for SPI communication

- SPI Communication Signals

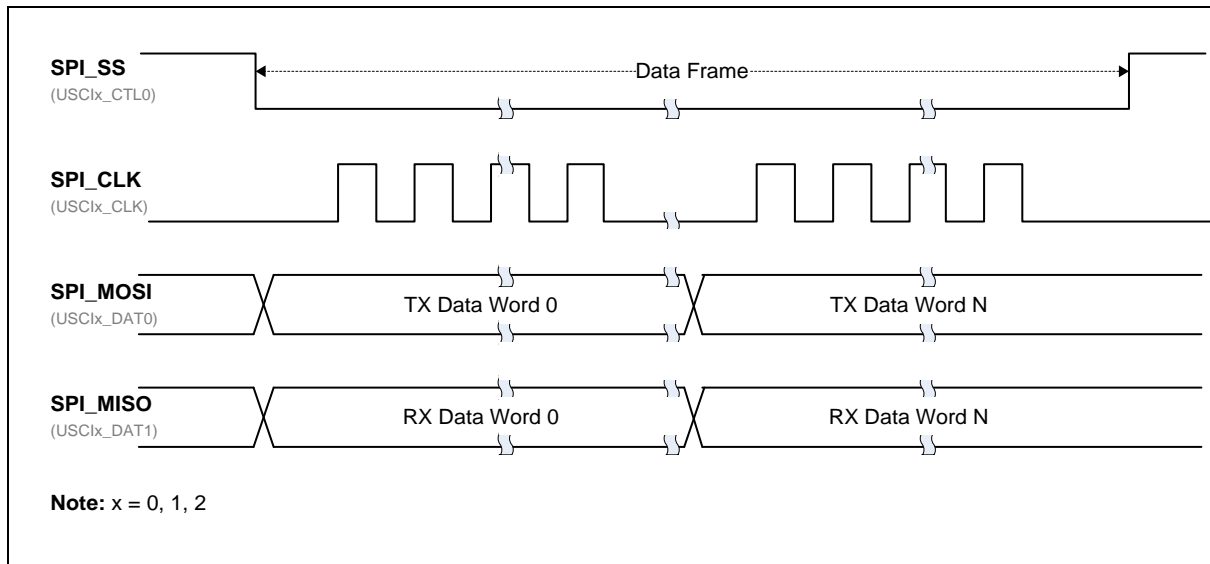

Figure 6.20-44-Wire Full-Duplex SPI Communication Signals (Master Mode)

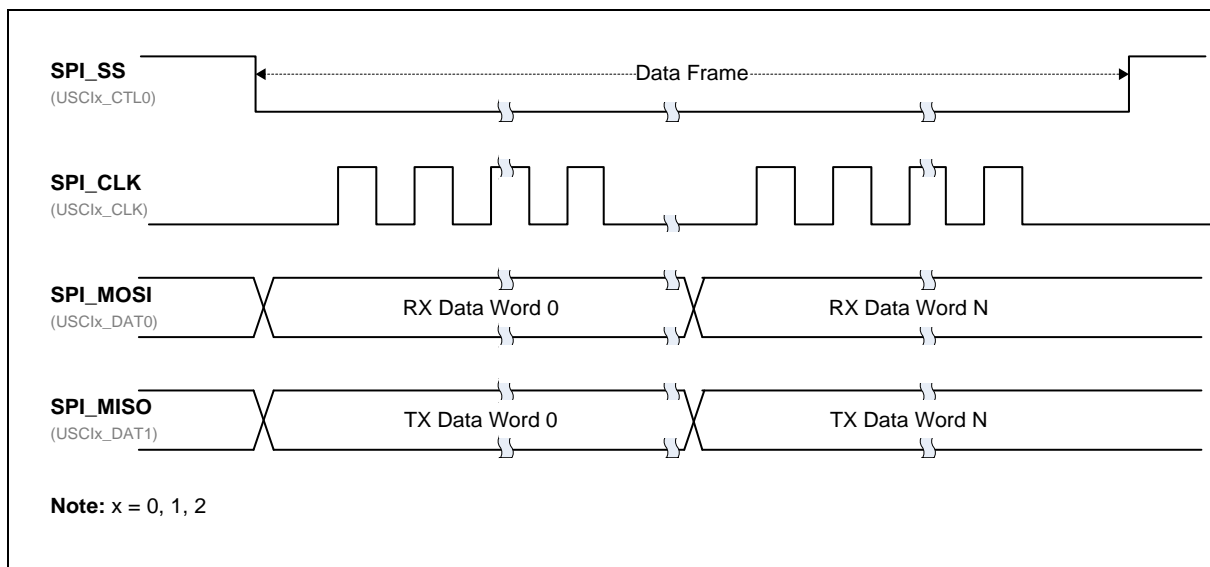

Figure 6.20-54-Wire Full-Duplex SPI Communication Signals (Slave Mode)

6.20.5.3 Serial Bus Clock Configuration

The USPI controller needs the peripheral clock to drive the USPI logic unit to perform the data transfer. The peripheral clock of USPI controller is from PCLK .

In Master mode, the frequency of the SPI bus clock is determined by protocol-relative clock generator. In general, the SPI bus clock is denoted as SPI clock. The frequency of SPI clock is half of f_{SAMP_CLK} , which can be selected by SPCLKSEL (USPI_BRGEN[3:2]).

In Slave mode, the SPI bus clock is provided by an off-chip Master device. The peripheral clock frequency, f_{PCLK} , of SPI Slave device must be 5-times faster than the serial bus clock rate of the SPI Master device connected together (i.e. the clock rate of serial bus clock < 1/5 peripheral clock f_{PCLK} in Slave mode).

In SPI protocol, SCLKMODE (USPI_PROTCTL[7:6]) defines not only the idle state of serial bus clock but also the serial clock edge used for transmit and receive data. Both Master and Slave devices on the same communication bus should have the same SCLKMODE configuration. The four kinds of serial bus

clock configuration are shown below.

SCLKMODE [1:0]	SPI Clock Idle State	Transmit Timing	Receive Timing
0x0	Low	Falling edge	Rising edge
0x1	Low	Rising edge	Falling edge
0x2	High	Rising edge	Falling edge
0x3	High	Falling edge	Rising edge

Table 6.20-2 Serial Bus Clock Configuration

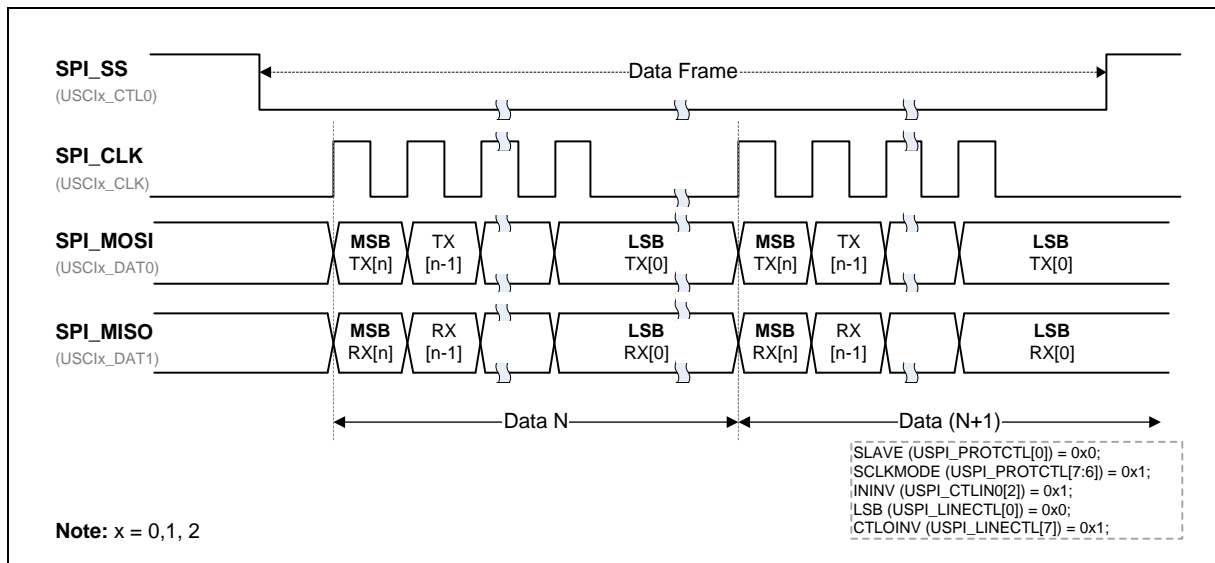

Figure 6.20-7 SPI Communication with Different SPI Clock Configuration (SCLKMODE=0x1)

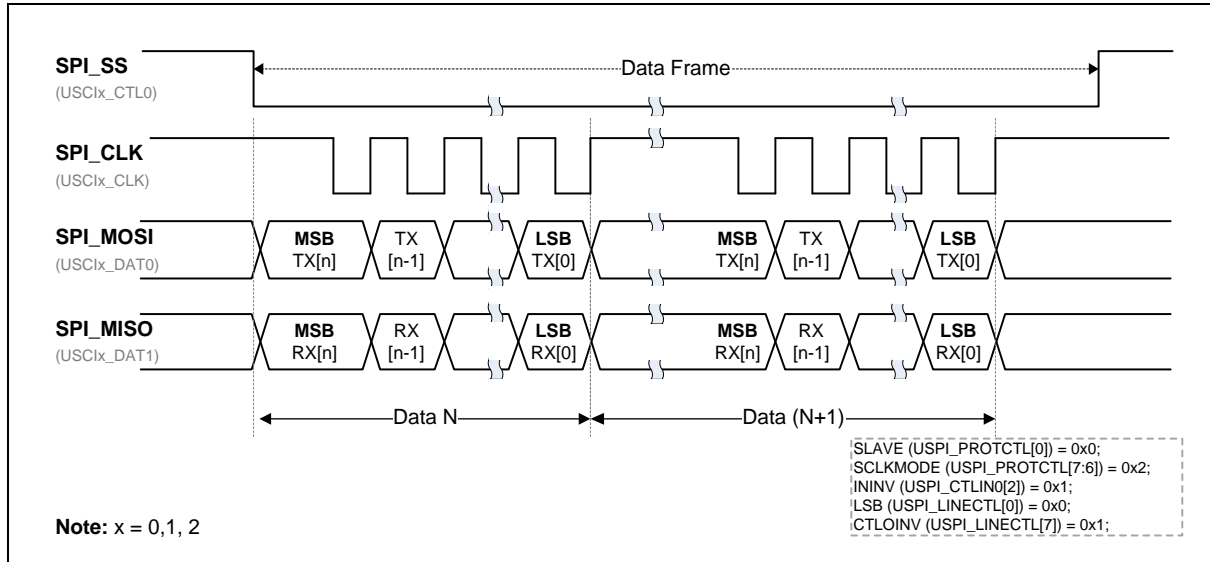

Figure 6.20-8 SPI Communication with Different SPI Clock Configuration (SCLKMODE=0x2)

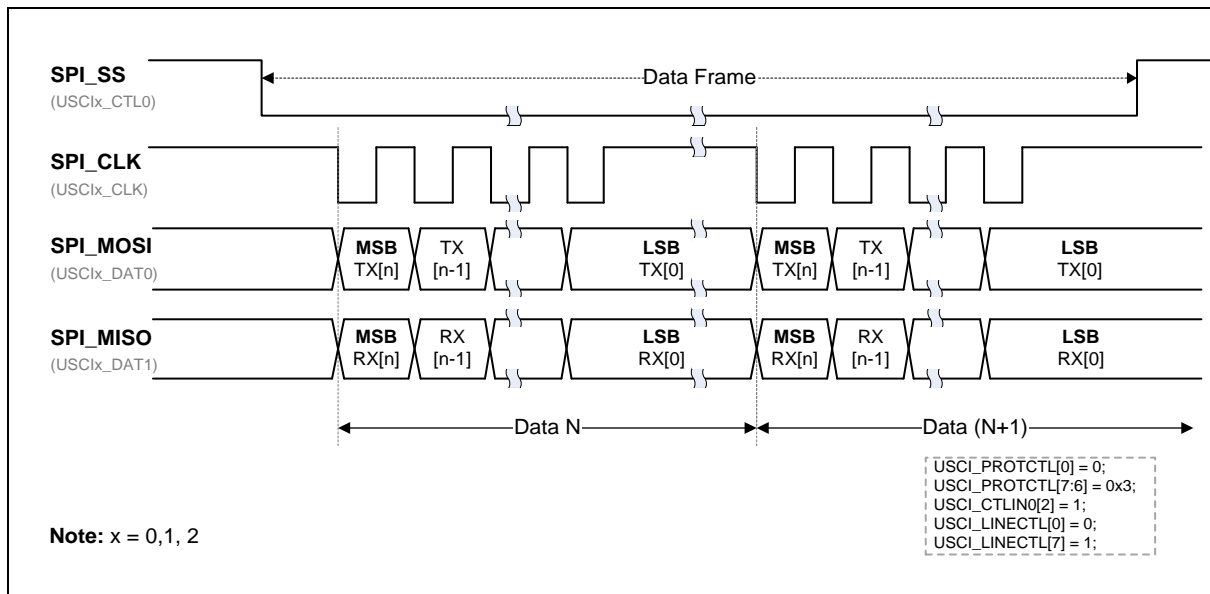

Figure 6.20-9 SPI Communication with Different SPI Clock Configuration (SCLKMODE=0x3)

6.20.5.4 Slave Select Signal

The slave selection signal of SPI protocol is active high by default. In SPI Master mode, the USPI controller can drive the control signal to off-chip SPI Slave device through slave select pin SPI_SS (USCIx_CTL0). In SPI Slave mode, the received slave select signal can be inverted by ININV (USPI_CTLIN0[2]).

If the slave select signal of external SPI Master device is low active, the ININV (USPI_CTLIN0[2]) setting of slave device should be set to 1 for the inversion of input control signal. If USPI operates as SPI Master mode, the output slave select inversion CTLOINV (USPI_LINECTL[7]) is also needed to set as 1

for the external SPI Slave device whose slave select signal is active low.

The duration between the slave select active edge and the first SPI clock input edge shall over 2 SPI bus clock cycles.

The input slave select signal of SPI Slave has to be kept inactive for at least 2 SPI bus clock cycles between two consecutive frames in order to correctly detect the end of a frame.

6.20.5.5 Transmit and Receive Data

The bit length of a transmit/receive data word in SPI protocol of USPI controller is defined in DWIDTH (USPI_LINECTL[11:8]), and it can be configured up to 16-bit length for transmitting and receiving data in SPI communication.

The LSB bit (USPI_LINECTL[0]) defines the order of transfer data bit. If the LSB bit is set to 1, the transmission data sequence is LSB first. If the LSB bit is cleared to 0, the transmission data sequence is MSB first.

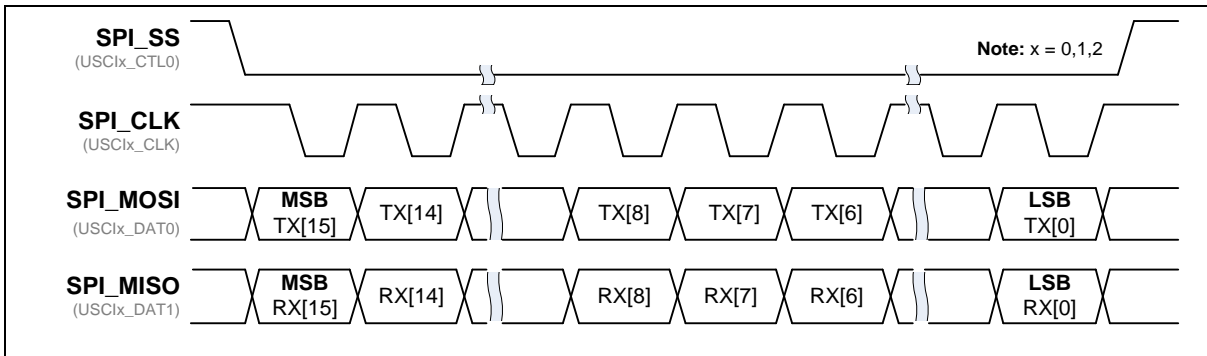

Figure 6.20-10 16-bit Data Length in One Word Transaction with MSB First Format

6.20.5.6 Word Suspend

SUSPITV (USPI_PROTCTL[11:8]) provides a configurable suspend interval, 0.5 ~ 15.5 SPI clock periods, between two successive transaction words in Master mode. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value of SUSPITV (USPI_PROTCTL[11:8]) is 0x3 (3.5 SPI clock cycles).

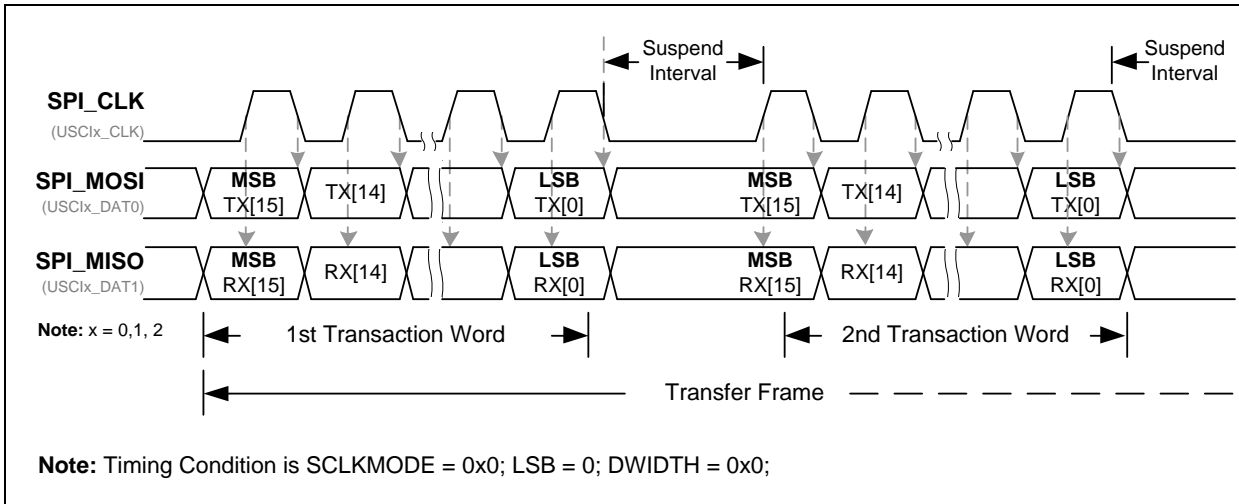

Figure 6.20-11 Word Suspend Interval between Two Transaction Words

6.20.5.7 Automatic Slave Select Function

AUTOSS (USPI_PROTCTL[3]) is used for SPI Master mode to enable the automatic slave select function. If the bit AUTOSS (USPI_PROTCTL[3]) is set, the slave select signal will be generated automatically and the setting value of SS (USPI_PROTCTL[2]) will not affect the output slave select (through USCIX_CTL0 line). This means that the slave select signal will be asserted by the USPI controller when the SPI data transfer is started by writing to the transmit buffer. And, it will be de-asserted after either all transaction is finished or one word transaction done if the value of SUSPITV (USPI_PROTCTL[11:8]) is equal to or greater than 3.

If the AUTOSS bit (USPI_PROTCTL[3]) is cleared, the slave select on USCIX_CTL0 pin will be asserted/de-asserted by setting/clearing the SS (USPI_PROTCTL[2]). The internal slave select signal is active high and the CTLOINV (USPI_LINECTL[7]) can be used for the inversion of the slave select signal.

In SPI Master mode, if the value of SUSPITV (USPI_PROTCTL[11:8]) is less than 3 and the AUTOSS (USPI_PROTCTL[3]) is set as 1, the slave select signal will be kept at active state between two successive word transactions.

In SPI Slave mode, to recognize the inactive state of the slave select signal, the inactive period of the received slave select signal must be larger than 2 peripheral clock cycles between two successive transactions.

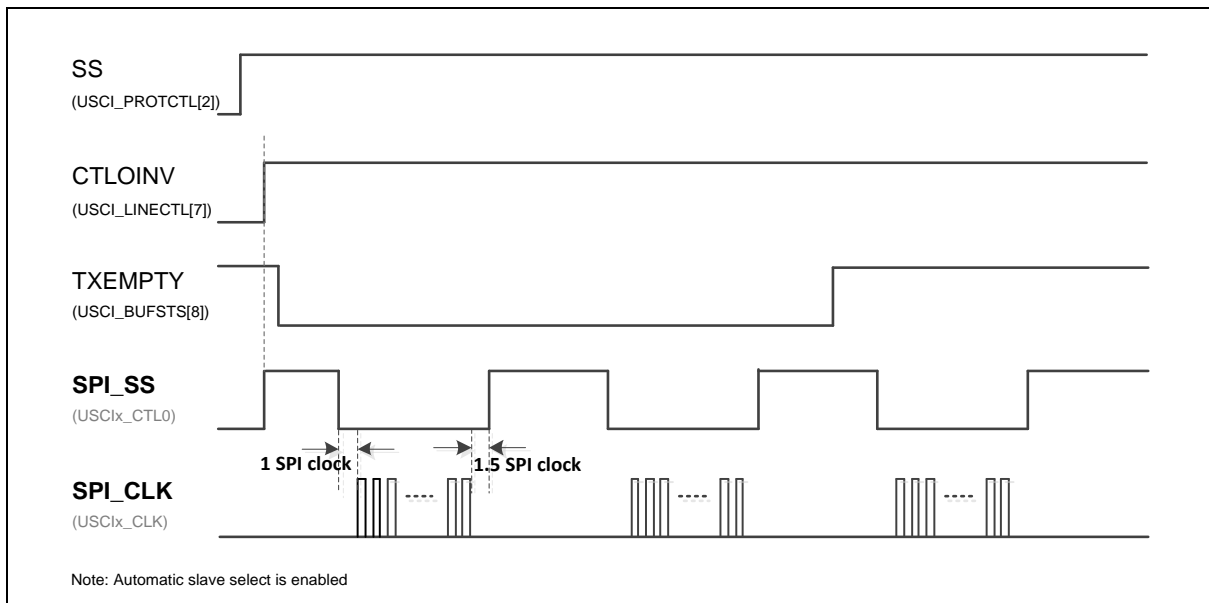

Figure 6.20-12 Auto Slave Select (SUSPITV ≥ 0x3)

Figure 6.20-13 Auto Slave Select (SUSPITV < 0x3)

6.20.5.8 Slave 3-wire Mode

When the SLV3WIRE (USPI_PROTCTL[1]) is set by software to enable the Slave 3-wire mode, the USCI SPI communication can work with no slave select signal in Slave mode. The SLV3WIRE (USPI_PROTCTL[1]) only takes effect in SPI Slave mode. Only three pins, SPI_CLK (through USCIX_CLK line), SPI_MOSI (through USCIX_DAT0 line), and SPI_MISO (through USCIX_DAT1 line), are required to communicate with a SPI Master. When the SLV3WIRE (USPI_PROTCTL[1]) is set to 1, the SPI Slave will be ready to transmit/receive data after the SPI protocol is enabled by setting FUNMODE(USPI_CTL [2:0]) to 0x1.

6.20.5.9 Data Transfer Mode

The USPI controller supports full-duplex SPI transfer and one data channel half-duplex SPI transfer.

- Full-duplex SPI transfer

In full-duplex SPI transfer, there are two data pins. One is used for transmitting data and the other is used for receiving data. Thus, data transmission and data reception can be performed simultaneously.

SCLKMODE (USPI_PROTCTL[7:6]) defines the transition timing of the data shift output signal on USCIX_DAT0 pin. The transition may happen at the corresponding edge of SPI bus clock or active edge of slave select signal. The level of the last data bit of a data word is held on USCIX_DAT0 pin until the next data word begins with the next corresponding edge of the serial bus clock.

- One data channel half-duplex SPI transfer

In one data channel half-duplex SPI transfer, there is only one data pin for data transfer. Thus, the data transmission and data reception are at different time interval. The data shift direction is determined by PORTDIR (USPI_TXDAT[16]). Refer to the register description for more detail information.

The function of one data channel half-duplex SPI transfer is similar to the full-duplex SPI protocol. All the transfer data timing is the same as the full-duplex SPI transfer.

Figure 6.20-14 shows the one output data channel and one input data channel half-duplex transfer diagrams with the external device.

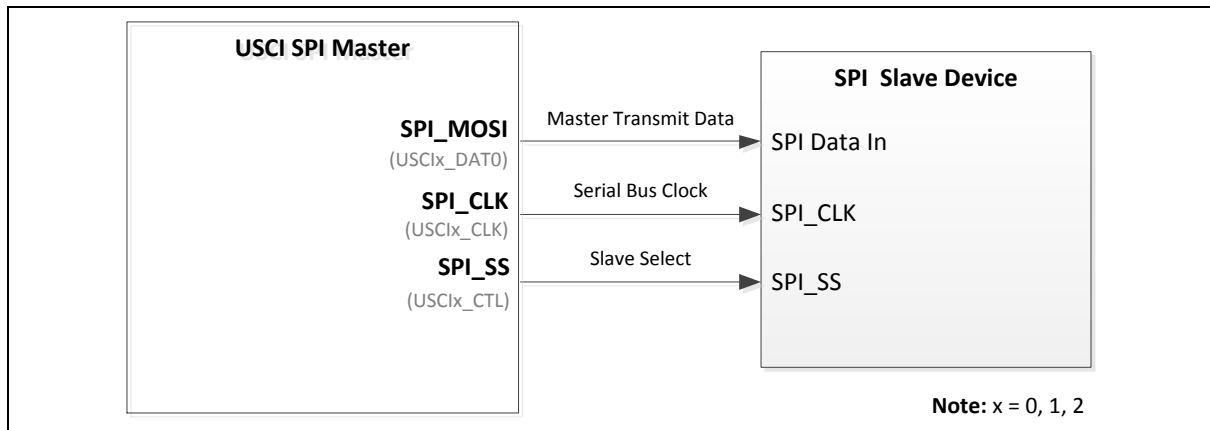

Figure 6.20-14 One Output Data Channel Half-duplex (SPI Master Mode)

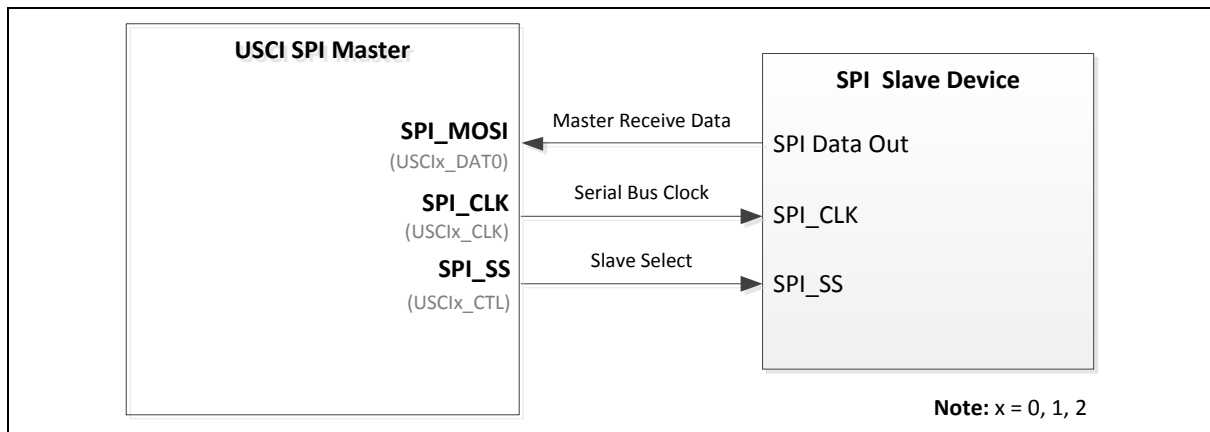

Figure 6.20-15 One Input Data Channel Half-duplex (SPI Master Mode)

The one data channel half-duplex transfer mode can be configured by TSMSEL[2:0] (USPI_PROTCTL[14:12]) and PORTDIR (USPI_TXDAT[16]) settings. When TSMSEL (USPI_PROTCTL[14:12]) is set to 0x4, one data channel half-duplex transfer mode is selected. The PORTDIR (USPI_TXDAT[16]) is used to define the direction of the corresponding transmit data. When the PORTDIR bit is set to 0, the USPI controller will send the corresponding data to external SPI device. When the PORTDIR bit is set to 1, the controller will read the corresponding data from the external SPI device.

For example, in one data channel half-duplex transfer mode with PORTDIR=0, USCI SPI transmits data through USCIX_DAT0 pin; if PORTDIR=1, USCI SPI receives data through USCIX_DAT0 pin.

6.20.5.10 Interrupt

Data Transfer Interrupts

- Transmit start interrupt

The interrupt event TXSTIF (USPI_PROTSTS[1]) is set after the start of the first data bit of a transmit data word. It can be cleared only by writing 1 to it.
- Transmit end interrupt

The interrupt event TXENDIF (USPI_PROTSTS[2]) is set after the start of the last data bit of the last transmit data which has been stored in transmit buffer. It can be cleared only by writing 1 to it.
- Receive start interrupt

The interrupt event RXSTIF (USPI_PROTSTS[3]) is set after the start of the first data bit of a receive data word. It can be cleared only by writing 1 to it.

- Receive end interrupt

The interrupt event RXENDIF (USPI_PROTSTS[4]) is set after the start of the last data bit of a receive data word. It can be cleared only by writing 1 to it.

Protocol-Related Interrupts

- SPI slave select interrupt

In SPI Slave mode, there are slave select active and in-active interrupt flags, SSACTIF (USPI_PROTSTS[9]) and SSINAIF (USPI_PROTSTS[8]), will be set to 1 when SLAVE (USPI_PROTCTL [0]) is set to 1 and Slave senses the slave select signal active or inactive. The SPI controller will issue an interrupt if SSINAIF (USPI_PROTIEN[0]) or SSACTIF (USPI_PROTIEN[1]), are set to 1. Because the internal slave select signal in SPI function is active high, the ININV (USPI_CTLIN0[2]) can be used for inverting the slave select signal comes from an active low device.

- Slave time-out interrupt

In SPI Slave mode, there is Slave time-out function for user to know that there is no serial clock input during the period of one word transaction. The Slave time-out function uses the timing measurement counter for the calculation of Slave time-out period which is defined by SLVTOCNT (USPI_PROTCTL[25:16]). TMCNTSRC (USPI_BRGEN[5]) can be used for clock frequency selection of timing measurement counter to calculate the Slave time-out period.

When the timing measurement counter is enabled by TMCNTEN (USPI_BRGEN[4]) and the setting value of SLVTOCNT (USPI_PROTCTL[25:16]) is not 0 in SPI Slave mode, the timing measurement counter will start counting after the first input serial clock of each received word data. This counter will be reset while receiving the following input serial clock and then keep counting. Finally, the timing measurement counter will be cleared and stopped after the finish of the current word transaction. If the value of the time-out counter is equal to or greater than the value of SLVTOCNT (USPI_PROTCTL[25:16]) before one word transaction is done, the Slave time-out interrupt event occurs and the SLVTOIF (USPI_PROTSTS[5]) will be set to 1.

Buffer-Related Interrupts

The buffer-related interrupts are available if there is transmit/receive buffer in USPI controller.

- Receive buffer overrun interrupt

If there is receive buffer overrun event, RXOVIF (USPI_BUFSTS[3]) will be set as 1. It can be cleared by write 1 into it.

- Transmit buffer under-run interrupt

If there is transmit buffer under-run event, TXUDRIF (USPI_BUFSTS[11]) will be set as 1. It can be cleared by write 1 into it.

6.20.5.11 Timing Diagram

The slave select signal of USPI SPI protocol is active high by default, and it can be inverted by CTLOINV (USPI_LINECTL[7]) setting.

The idle state of serial bus clock and the serial bus clock edge used for transmit/receive data can be configured by setting SCLKMODE (USPI_PROTCTL[7:6]). The bit length of a transaction word data is determined by DWIDTH (USPI_LINECTL[11:8]), and data bit transfer sequence is determined by LSB (USPI_LINECTL[0]). Four SPI timing diagrams for Master/Slave operations and the related settings are shown below.

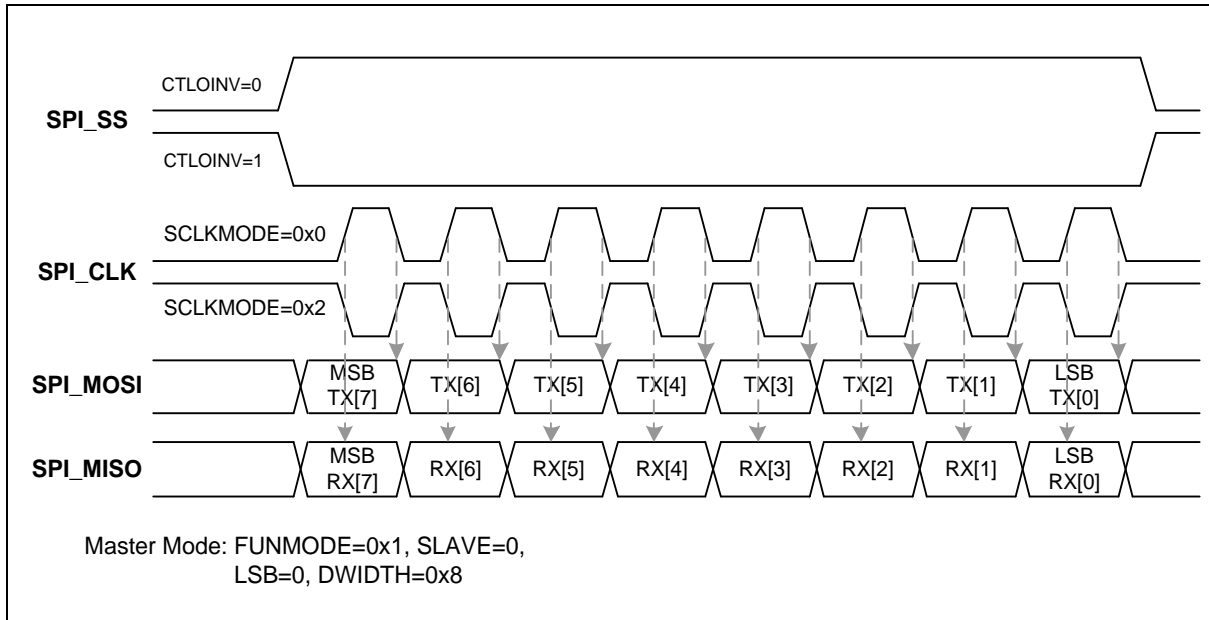

Figure 6.20-16 SPI Timing in Master Mode

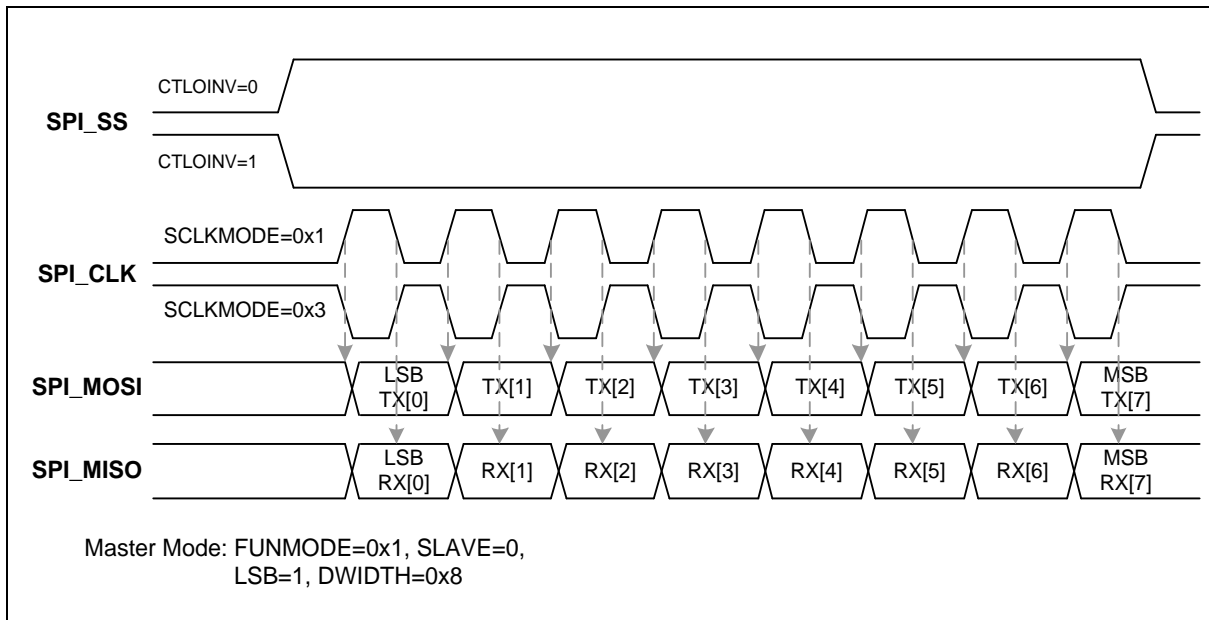

Figure 6.20-17 SPI Timing in Master Mode (Alternate Phase of Serial Bus Clock)

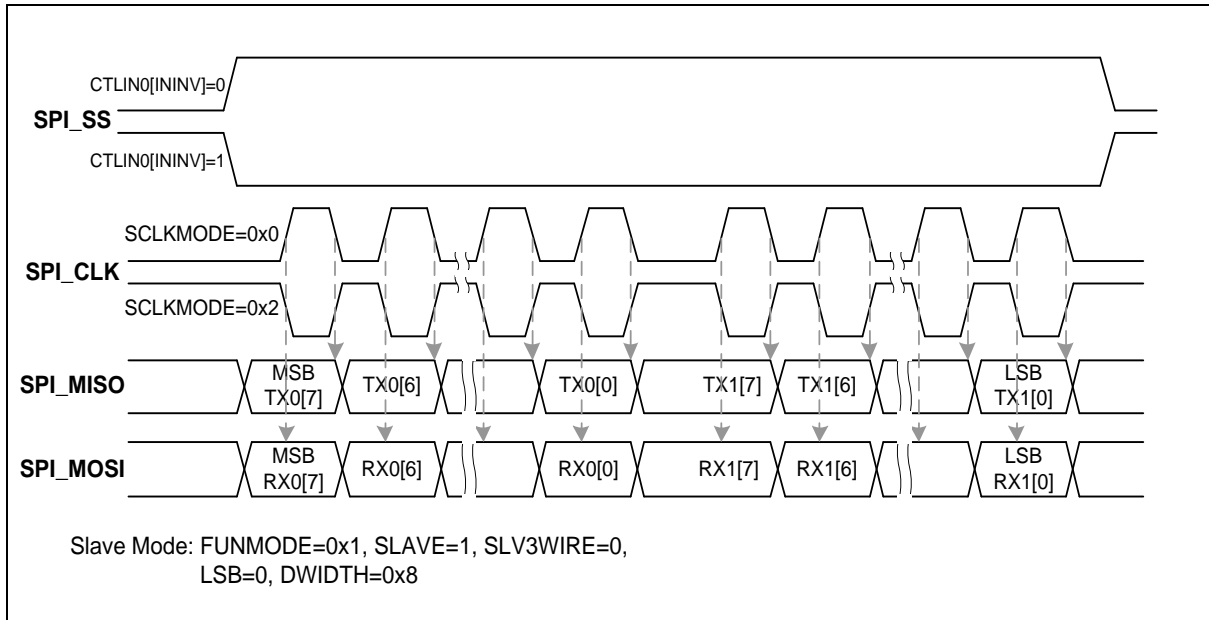

Figure 6.20-18 SPI Timing in Slave Mode

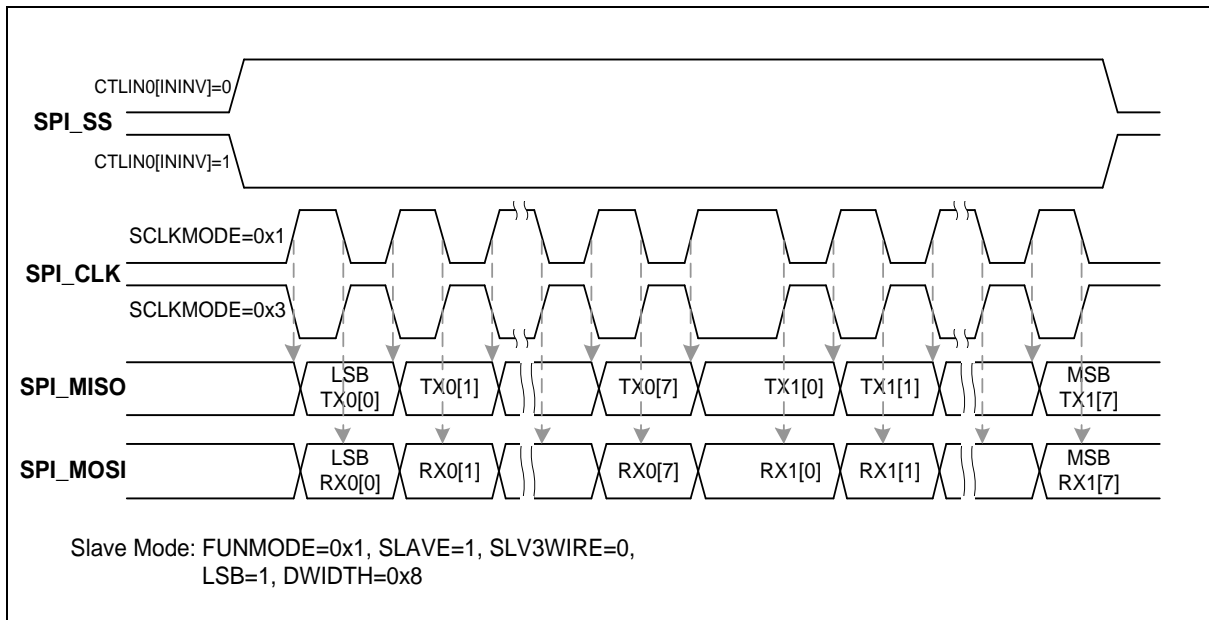

Figure 6.20-19 SPI Timing in Slave Mode (Alternate Phase of Serial Bus Clock)

6.20.5.12 Programming Flow

This section describes the programming flow for USCI SPI data transfer.

For Master mode:

1. Enable USPI peripheral clock by setting CLK_APBCLK1 register.
2. Configure user-specified pins as USPI function pins by setting corresponding multiple function control registers.
3. Set FUNMODE (USPI_CTL[2:0]) to 1 to select SPI mode.
4. Set USPI_BRGEN register to determine the SPI bus clock frequency.

5. According to the requirements of user's application, configure the settings as follows.
 - CTLOINV (USPI_LINECTL[7]): If the slave selection signal is active low, set this bit to 1; otherwise, set it to 0.
 - DWIDTH (USPI_LINECTL[11:8]): Data width setting.
 - LSB (USPI_LINECTL[0]): LSB first or MSB first.
 - TSMSEL (USPI_PROTCTL[14:12]): Full-duplex SPI transfer or one channel half-duplex SPI transfer.
 - SCLKMODE (USPI_PROTCTL[7:6]): Determine the clock timing.
 - AUTOSS (USPI_PROTCTL[3]): Enable automatic slave select function or not.
 - SLAVE (USPI_PROTCTL[0]): Set to 0 for Master mode.
 - Set PROTEN (USPI_PROTCTL[31]) to 1 to enable SPI protocol.
6. If automatic slave select function is disabled (AUTOSS=0), set SS (USPI_PROTCTL[2]) to 1 before data transfer; set SS to 0 to inactivate the slave selection signal by user's application.
7. Write USPI_TXDAT register to trigger SPI transfer. In half-duplex SPI transfer, the data pin direction is determined by PORTDIR (USPI_TXDAT[16]) setting.
8. User can get the received data by reading USPI_RXDAT register as long as RXEMPTY (USPI_BUFSTS[0]) is 0. The SPI data transfer can be triggered by writing USPI_TXDAT register as long as TXFULL (USPI_BUFSTS[9]) is 0.

For Slave mode:

1. Enable USPI peripheral clock by setting CLK_APBCLK1 register.
2. Configure user-specified pins as USPI function pins by setting corresponding multiple function control registers.
3. Set FUNMODE (USPI_CTL[2:0]) to 1 to select SPI mode.
4. According to the requirements of user's application, configure the settings as follows.
 - ININV (USPI_CTLIN0[2]): If the slave selection signal is active low, set this bit to 1; otherwise, set it to 0.
 - DWIDTH (USPI_LINECTL[11:8]): Data width setting.
 - LSB (USPI_LINECTL[0]): LSB first or MSB first.
 - TSMSEL (USPI_PROTCTL[14:12]): Full-duplex SPI transfer or one channel half-duplex SPI transfer.
 - SCLKMODE (USPI_PROTCTL[7:6]): Determine the clock timing.
 - SLAVE (USPI_PROTCTL[0]): Set to 1 for Slave mode.
5. Set PROTEN (USPI_PROTCTL[31]) to 1 to enable SPI protocol.
6. Write USPI_TXDAT register for transmission. In half-duplex SPI transfer, the data pin direction is determined by PORTDIR (USPI_TXDAT[16]) setting.
7. User can get the received data by reading USPI_RXDAT register as long as RXEMPTY (USPI_BUFSTS[0]) is 0. The next datum for transmission can be written to USPI_TXDAT register as long as TXFULL (USPI_BUFSTS[9]) is 0.

6.20.5.13 Wake-up Function

The USCI Controller in SPI mode supports wake-up system function. The wake-up source in SPI protocol is the transition of input slave select signal.

6.20.6 Register Map

R: read only, W: write only, R/W: both read and write

Bits	Description
[31:5]	Reserved Reserved.
[4]	RXENDIEN Receive End Interrupt Enable Bit This bit enables the interrupt generation in case of a receive finish event. 0 = The receive end interrupt Disabled. 1 = The receive end interrupt Enabled. Note: The receive finish event happens when hardware receives the last bit of RX data into shift data unit.
[3]	RXSTIEN Receive Start Interrupt Enable Bit This bit enables the interrupt generation in case of a receive start event. 0 = The receive start interrupt Disabled. 1 = The receive start interrupt Enabled. Note: For SPI master mode, the receive start event happens when SPI master sends slave select active and spi clock to the external SPI slave. For SPI slave mode, the receive start event happens when slave select of SPI slave is active and spi clock of SPI slave is inputted from the external SPI master.
[2]	TXENDIEN Transmit End Interrupt Enable Bit This bit enables the interrupt generation in case of a transmit finish event. 0 = The transmit finish interrupt Disabled. 1 = The transmit finish interrupt Enabled. Note: The transmit finish event happens when hardware sends the last bit of TX data from shift data unit.
[1]	TXSTIEN Transmit Start Interrupt Enable Bit This bit enables the interrupt generation in case of a transmit start event. 0 = The transmit start interrupt Disabled. 1 = The transmit start interrupt Enabled. Note: The transmit start event happens when hardware starts to move TX data from data buffer to shift data unit.
[0]	Reserved Reserved.

USCI Protocol Control Register – USPI_PROTCTL (SPI)

Register	Offset	R/W	Description	Reset Value
USPI_PROTCTL	USPIn_BA+0x5C	R/W	USCI Protocol Control Register	0x0000_0300

31	30	29	28	27	26	25	24
PROTEN	Reserved		TXUDRPOL	Reserved		SLVTOCNT	
23	22	21	20	19	18	17	16
SLVTOCNT							
15	14	13	12	11	10	9	8
Reserved	TSMSEL			SUSPITV			
7	6	5	4	3	2	1	0
SCLKMODE		Reserved		AUTOSS	SS	SLV3WIRE	SLAVE

Bits	Description	
[31]	PROTEN	SPI Protocol Enable Bit 0 = SPI Protocol Disabled. 1 = SPI Protocol Enabled.
[30:29]	Reserved	Reserved.
[28]	TXUDRPOL	Transmit Under-run Data Polarity (for Slave) This bit defines the transmitting data level of USCIx_DAT1 when no data is available for transferring. 0 = The output data level is 0 if TX under run event occurs. 1 = The output data level is 1 if TX under run event occurs.
[27:26]	Reserved	Reserved.
[25:16]	SLVTOCNT	Slave Mode Time-out Period (Slave Only) In Slave mode, this bit field is used for Slave time-out period. This bit field indicates how many clock periods (selected by TMCNTSRC, USPI_BRGEN[5]) between the two edges of input SCLK will assert the Slave time-out event. Writing 0x0 into this bit field will disable the Slave time-out function. Example: Assume SLVTOCNT is 0x0A and TMCNTSRC (USPI_BRGEN[5]) is 1, it means the time-out event will occur if the state of SPI bus clock pin is not changed more than (10+1) periods of f_{DIV_CLK} .
[15]	Reserved	Reserved.
[14:12]	TSMSEL	Transmit Data Mode Selection This bit field describes how receive and transmit data is shifted in and out. 000 = TSMSEL: Full-duplex SPI. 100 = TSMSEL: Half-duplex SPI. Others = Reserved. Note: Changing the value of this bit field will produce the TXRST and RXRST to clear the TX/RX data buffer automatically.
[11:8]	SUSPITV	Suspend Interval (Master Only) This bit field provides the configurable suspend interval between two successive transmit/receive transaction in a transfer. The definition of the suspend interval is the

		<p>interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value is 0x3. The period of the suspend interval is obtained according to the following equation.</p> $(SUSPITV + 0.5) * \text{period of SPI_CLK clock cycle}$ <p>Example: SUSPITV = 0x0 ... 0.5 SPI_CLK clock cycle. SUSPITV = 0x1 ... 1.5 SPI_CLK clock cycle. SUSPITV = 0xE ... 14.5 SPI_CLK clock cycle. SUSPITV = 0xF ... 15.5 SPI_CLK clock cycle.</p>
[7:6]	SCLKMODE	<p>Serial Bus Clock Mode</p> <p>This bit field defines the SCLK idle status, data transmit, and data receive edge.</p> <p>00 = MODE0. The idle state of SPI clock is low level. Data is transmitted with falling edge and received with rising edge.</p> <p>01 = MODE1. The idle state of SPI clock is low level. Data is transmitted with rising edge and received with falling edge.</p> <p>10 = MODE2. The idle state of SPI clock is high level. Data is transmitted with rising edge and received with falling edge.</p> <p>11 = MODE3. The idle state of SPI clock is high level. Data is transmitted with falling edge and received with rising edge.</p>
[5:4]	Reserved	Reserved.
[3]	AUTOSS	<p>Automatic Slave Select Function Enable (Master Only)</p> <p>0 = Slave select signal will be controlled by the setting value of SS (USPI_PROTCTL[2]) bit.</p> <p>1 = Slave select signal will be generated automatically. The slave select signal will be asserted by the SPI controller when transmit/receive is started, and will be de-asserted after each transmit/receive is finished.</p>
[2]	SS	<p>Slave Select Control (Master Only)</p> <p>If AUTOSS bit is cleared, setting this bit to 1 will set the slave select signal to active state, and setting this bit to 0 will set the slave select signal back to inactive state.</p> <p>If the AUTOSS function is enabled (AUTOSS = 1), the setting value of this bit will not affect the current state of slave select signal.</p> <p>Note: In SPI protocol, the internal slave select signal is active high.</p>
[1]	SLV3WIRE	<p>Slave 3-wire Mode Selection (Slave Only)</p> <p>The SPI protocol can work with 3-wire interface (without slave select signal) in Slave mode.</p> <p>0 = 4-wire bi-direction interface. 1 = 3-wire bi-direction interface.</p>
[0]	SLAVE	<p>Slave Mode Selection</p> <p>0 = Master mode. 1 = Slave mode.</p>

6.21 USCI - I²C Mode

6.21.1 Overview

On I²C bus, data is transferred between a Master and a Slave. Data bits transfer on the SCL and SDA lines are synchronously on a byte-by-byte basis. Each data byte is 8-bit. There is one SCL clock pulse for each data bit with the MSB being transmitted first, and an acknowledge bit follows each transferred byte. Each bit is sampled during the high period of SCL; therefore, the SDA line may be changed only during the low period of SCL and must be held stable during the high period of SCL. A transition on the SDA line while SCL is high is interpreted as a command (START or STOP). Please refer to Figure 6.21-1 for more detailed I²C BUS Timing.

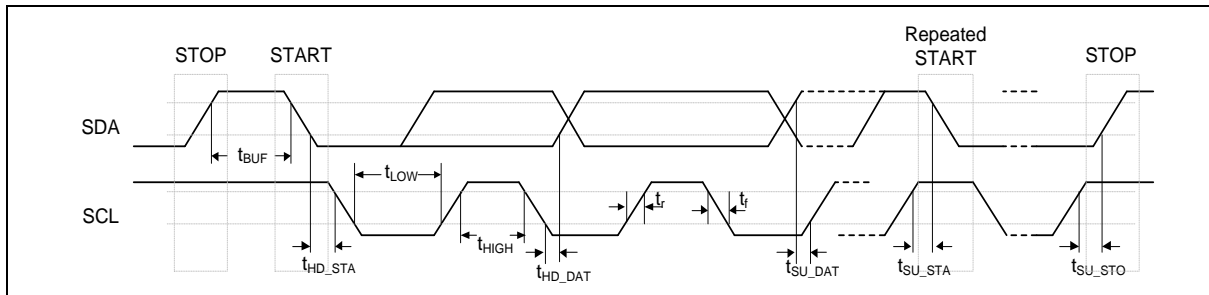

Figure 6.21-1 I²C Bus Timing

The device's on-chip I²C provides the serial interface that meets the I²C bus standard mode specification. The I²C port handles byte transfers autonomously. The I²C mode is selected by FUNMODE (UI2C_CTL [2:0]) = 100B. When enable this port, the USCI interfaces to the I²C bus via two pins: SDA and SCL. When I/O pins are used as I²C ports, user must set the pins function to I²C in advance.

Note: Pull-up resistor is needed for I²C operation because the SDA and SCL are set to open-drain pins when USCI is selected to I²C operation mode.

6.21.2 Features

- Full master and slave device capability
- Supports of 7-bit addressing, as well as 10-bit addressing
- Communication in standard mode (100 kBit/s) or in fast mode (up to 400 kBit/s)
- Supports multi-master bus
- Supports one transmit buffer and two receive buffer for data payload
- Supports 10-bit bus time-out capability
- Supports bus monitor mode.
- Supports Power down wake-up by data toggle or address match
- Supports setup/hold time programmable
- Supports multiple address recognition (two slave address with mask option)

6.21.3 Block Diagram

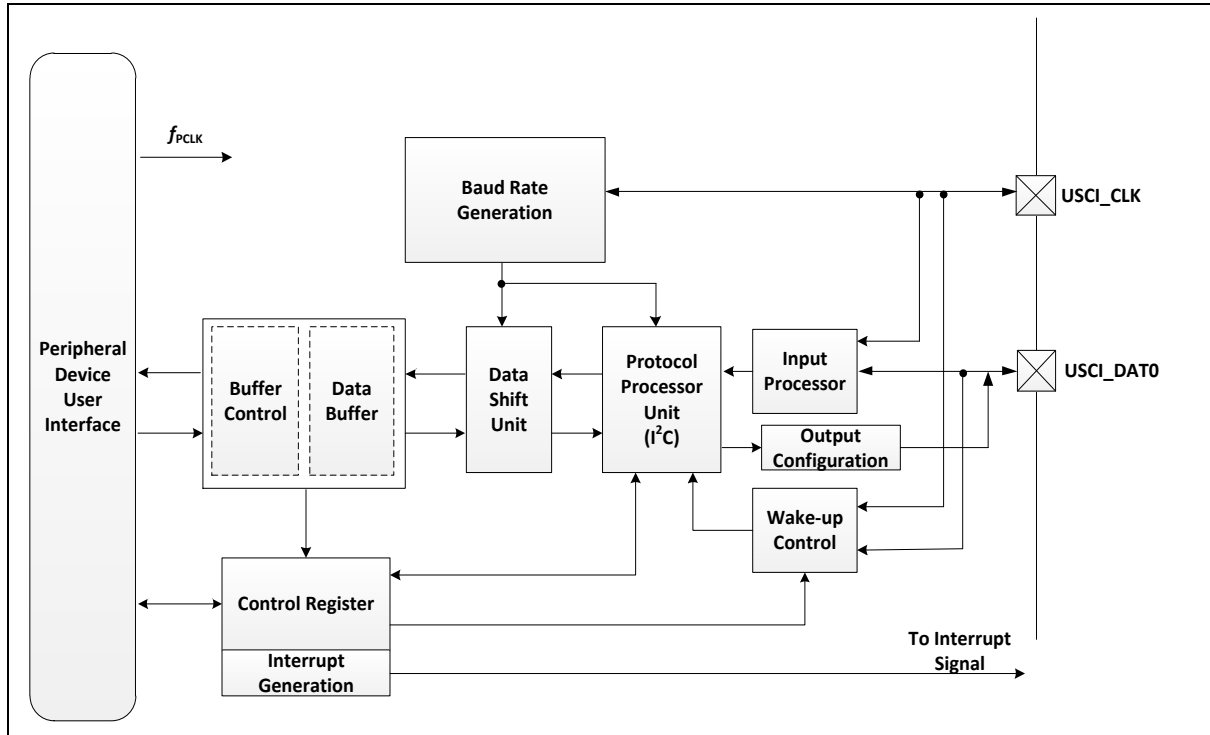

Figure 6.21-2 USC1 I²C Mode Block Diagram

6.21.4 Basic Configuration

6.21.4.1 USC10 I²C Basic Configurations

The basic configurations of USC10_I2C are as follows:

- Clock Source Configuration
 - Enable USC10 peripheral clock in USCIOCKEN (CLK_APBCLK1[8]).
 - Enable USC10_I2C function in UI2C_CTL[2:0] register, UI2C_CTL[2:0]=3'b100
- Reset Configuration
 - Reset USC10 controller in USC10RST (SYS_IPRST2[8]).
- Pin Configuration

Group	Pin Name	GPIO	MFP
USC10	USC10_CLK	PD.0	MFP3
		PB.12	MFP5
		PA.11	MFP6
		PE.2	MFP7
	USC10_DAT0	PD.1	MFP3
		PB.13	MFP5
		PA.10	MFP6
		PE.3	MFP7

The basic configurations of USCI1_I2C are as follows:

Clock Source Configuration

- Enable USCI1 peripheral clock in USCI1CKEN (CLK_APBCLK1[9]).
- Enable USCI1_I2C functi on UI2C_CTL[2:0]) register, UI2C_CTL[2:0]=3'b100
- Reset Configuration
 - Reset USCI1 controller in USCI1RST (SYS_IPRST2[9]).
- Pin Configuration

		GPC.1	MFP13

6.21.5 Functional Description

6.21.5.1 START or Repeated START Signal

Figure 6.21-3 shows the typical I²C protocol. Normally, a standard communication consists of four parts:

- START or Repeated START signal generation
- Slave address and R/W bit transfer

- Data transfer
- STOP signal generation

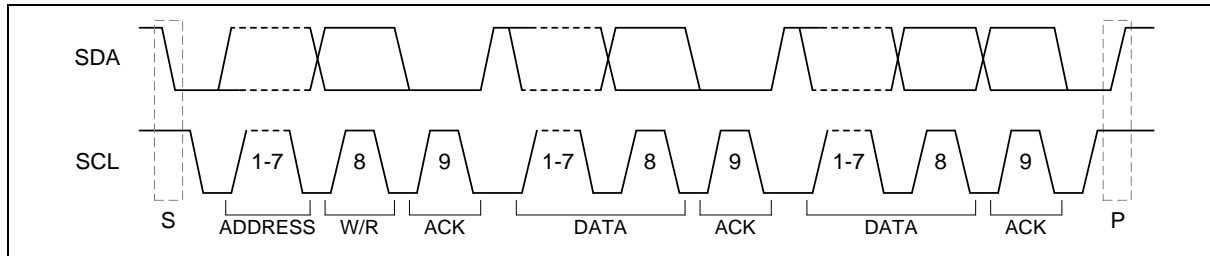

Figure 6.21-3 I²C Protocol

When the bus is free/idle, meaning no master device is engaging the bus (both SCL and SDA lines are high), a master can initiate a transfer by sending a START signal. A START signal, usually referred to as the “S” bit, is defined as a HIGH to LOW transition on the SDA line while SCL is HIGH. The START signal denotes the beginning of a new data transmission.

A Repeated START is not a STOP signal between two START signals and usually referred to as the “Sr” bit. The master uses this method to communicate with another slave or the same slave in a different transfer direction (e.g. from writing to a device to reading from a device) without releasing the bus idle flag.

6.21.5.2 STOP Signal

The master can terminate the communication by generating a STOP signal. A STOP signal, usually referred to as the “P” bit, is defined as a LOW to HIGH transition on the SDA line while SCL is HIGH. The section between STOP and START is called bus free.

Figure 6.21-4 shows the waveform of START, Repeat START and STOP.

Figure 6.21-4 START and STOP Conditions

6.21.5.3 Slave Address Transfer

After a (Repeated) START condition, the master sends a slave address to identify the target device of the communication. The start address can comprise one or two address bytes (for 7-bit or for 10-bit addressing schemes). After an address byte, a slave sensitive to the transmitted address has to acknowledge the reception.

Therefore, the slave’s address can be programmed in the device, where it is compared to the received address. In case of a match, the slave answers with an acknowledge (SDA = 0). Slaves that are not targeted answer with a non-acknowledge (SDA = 1). In addition to the match of the programmed address, another address byte value has to be answered with an acknowledge if the slave is capable to handle the corresponding requests. The address byte 00H indicates a general call address that can be acknowledged.

In order to allow selective acknowledges for the different values of the address byte(s), the following control mechanism is implemented:

- If the GCFUNC bit (UI2C_PROTCTL [0]) is set the I²C port hardware will respond to General Call address (00H). Clear GC bit to disable general call function.
- The I²C port is equipped with one device address registers, UI2C_DEVADDRn (n = 0~1). In 7-bit address mode, the first 7 bits of a received first address byte are compared to the programmed slave address (UI2C_DEVADDRn [6:0]). If these bits match, the slave sends an acknowledge.
- For 10 bit addressing mode, if the slave address is programmed to 1111 0XXB, the XX bits are compared to the bits UI2C_DEVADDR [9:8] to check for address match and also sends an acknowledge when ADDR10EN (UI2C_PROTCTL [4]) is set. The slave waits for a second address byte compares it with UI2C_DEVADDR [7:0] and sends an acknowledge accordingly to cover the 10 bit addressing mode. The user has to take care about reserved addresses (refer to I²C specification for more detailed description). Only the address 1111 0XXB is supported. Under each of these conditions, bit SLASEL (UI2C_PROTSTS [14]) will be set when the addressing delivered a match. This SLASEL (UI2C_PROTSTS [14]) bit is cleared automatically by a (Repeated) START or STOP condition.
- The I²C port is equipped with multiple address recognition with one address mask registers I2C_ADDRMSKn (n = 0~1). When the bit in the address mask register is set to 1, it means the received corresponding address bit is "Don't care". If the bit is set to 0, it means the received corresponding register bit should be exactly the same as address register.

6.21.5.4 Data Transfer

When a slave receives a correct address with an R/W bit, the data will follow R/W bit specified to transfer. Each transferred byte is followed by an acknowledge bit on the 9th SCL clock cycle. If the slave signals a Not Acknowledge (NACK), the master can generate a STOP signal to abort the data transfer or generate a Repeated START signal and start a new transfer cycle.

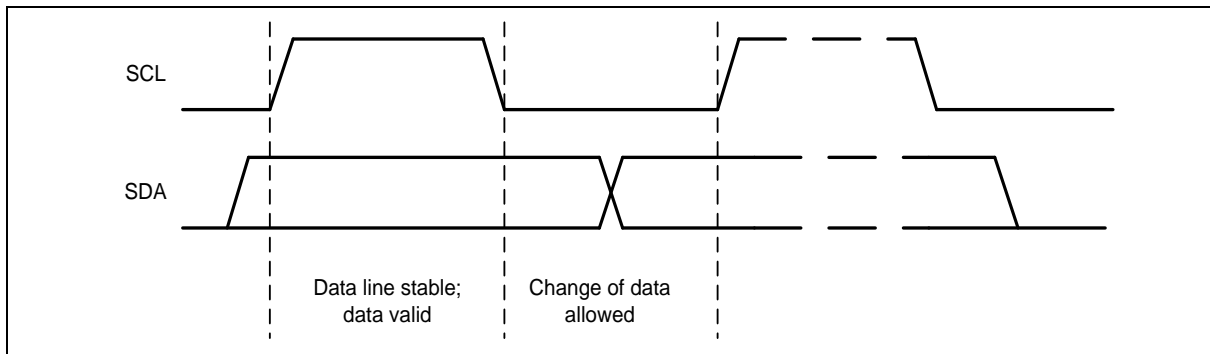

Figure 6.21-5 Bit Transfer on the I²C Bus

If the master receives data, does Not Acknowledge (NACK) the slave, the slave releases the SDA line for the master to generate a STOP or Repeated START signal.

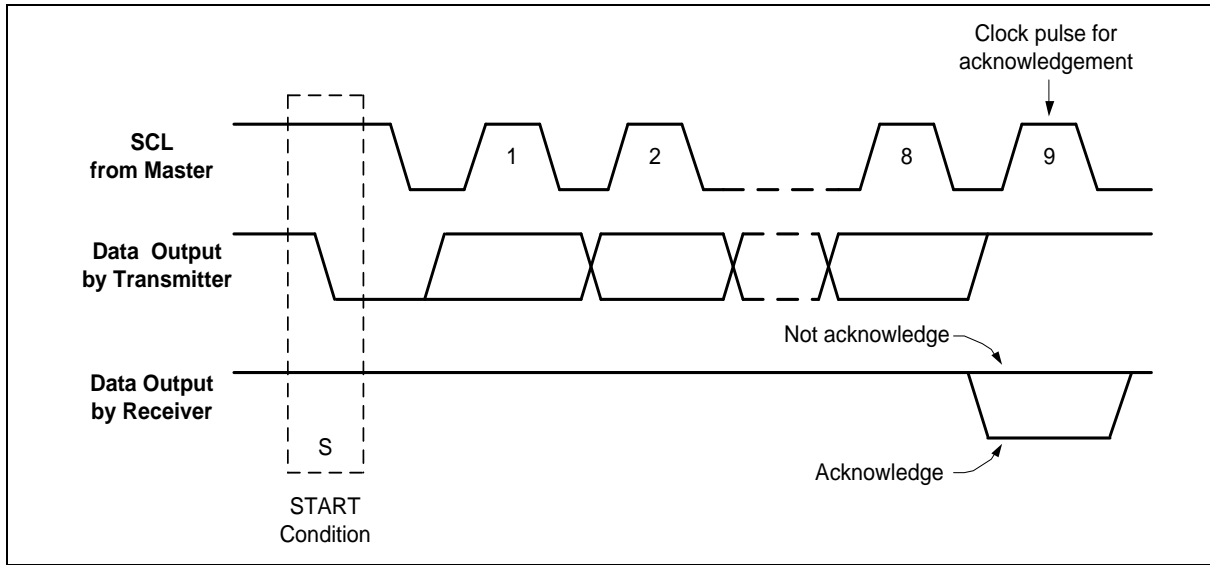

Figure 6.21-6 Acknowledge on the I²C Bus

6.21.5.5 Clock Baud Rate Bits

The data baud rate of I²C is determined by UI2C_BRGEN register when I²C is in Master Mode, and it is not necessary in a Slave mode. In the Slave mode, I²C will automatically synchronize it with any clock frequency from master I²C device. The bits RCLKSEL, SPCLKSEL, PDSCNT, and DSCNT define the baud rate setting:

- RCLKSEL (UI2C_BRGEN [0])
to define the input frequency f_{REF_CLK}
- SPCLKSEL (UI2C_BRGEN[3:2])
to define the multiple source of the sample clock f_{SAMP_CLK}
- PDSCNT (UI2C_BRGEN [9:8])
to define the length of a data sample time (division of f_{REF_CLK} by 1, 2, 3, or 4)
- DSCNT (UI2C_BRGEN [14:10])
to define the number of data sample time per bit time

The standard setting is given by RCLKSEL = 0 ($f_{REF_CLK} = f_{PCLK}$), PTCLKSEL = 0 ($f_{PROT_CLK} = f_{REF_CLK}$) and SPCLKSEL = 2'b00 ($f_{SAMP_CLK} = f_{DIV_CLK}$). Under these conditions, the baud rate is given by:

$$f_{I2C} = f_{REF_CLK} \times \frac{1}{CLKDIV + 1} \times \frac{1}{PDSCNT + 1} \times \frac{1}{DSCNT + 1}$$

In order to generate slower frequencies, additional divide-by-2 stages can be selected by PTCLKSEL = 1 ($f_{PROT_CLK} = f_{REF_CLK} / 2$), leading to:

$$f_{I2C} = \frac{f_{REF_CLK}}{2} \times \frac{1}{CLKDIV + 1} \times \frac{1}{PDSCNT + 1} \times \frac{1}{DSCNT + 1}$$

If SPCLKSEL = 2'b10 ($f_{SAMP_CLK} = f_{SCLK}$), and RCLKSEL = 0 ($f_{REF_CLK} = f_{PCLK}$), PTCLKSEL = 0 ($f_{PROT_CLK} = f_{REF_CLK}$). The baud rate is given by:

$$f_{I2C} = f_{REF_CLK} \times \frac{1}{CLKDIV + 1} \times \frac{1}{2} \times \frac{1}{PDSCNT + 1} \times \frac{1}{DSCNT + 1}$$

6.21.5.6 Byte Stretching

If a device is selected as master/slave transmit mode and should transmit a data byte but the transmit buffer TXDAT does not contain valid data to be transmitted, the device ties down SCL = 0 at the end of the previous acknowledge bit. The waiting period is finished if software writes 1 to PTRG (UI2C_PROTCTL [5]).

6.21.5.7 Multi-master Arbitration

In some applications, there are two or more masters on the same I²C bus to access slaves, and the masters may transmit data simultaneously. The I²C supports multi-master by including collision detection and arbitration to prevent data corruption.

If two masters sometimes initiate I²C command at the same time, the arbitration procedure determines which master wins and can continue with the command. Arbitration is performed on the SDA signal while the SCL signal is high. Each master checks if the SDA signal on the bus corresponds to the generated SDA signal. If the SDA signal on the bus is low but it should be high, then this master has lost arbitration. Master I²C device that has lost arbitration can generate SCL pulses until the byte ends and must then release the bus and go into slave mode. The arbitration procedure can continue until all the data is transferred. This means that in multi-master system each I²C master must monitor the I²C bus for collisions and act accordingly. Figure 6.21-7 describes master1 data and master2 data are compete arbitration.

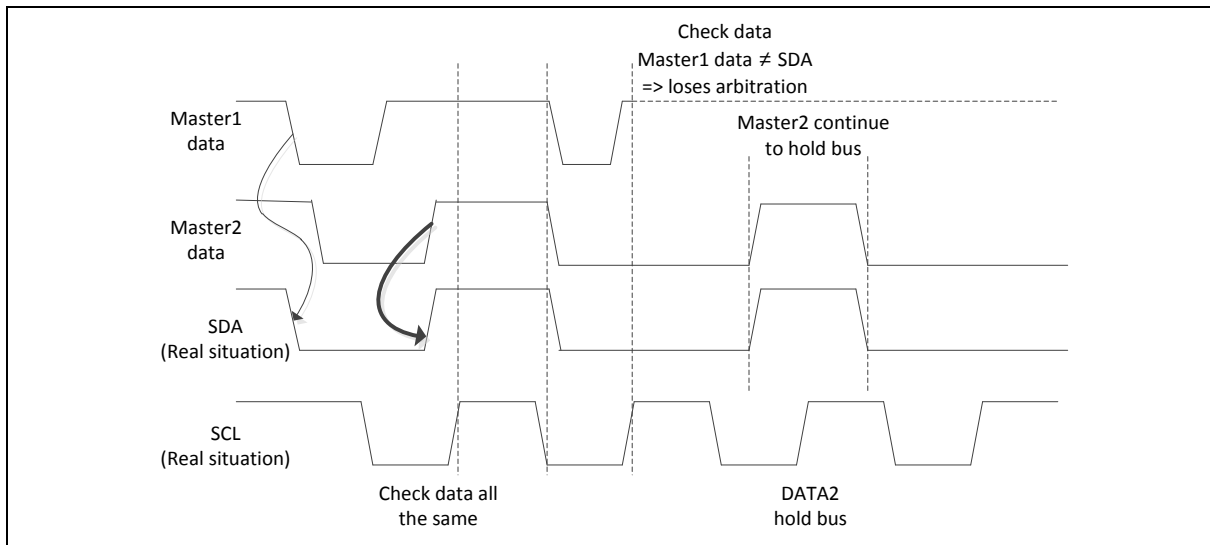

Figure 6.21-7 Arbitration Lost

In this case, during the address and data transmission, the master transmitter checks at the rising edge of SCL for each data bit if the value it is sending is equal to the value read on the SDA line. If yes, master can hold bus continuously. If this is not the case (transmitted value = 1, value read = 0), the master has lost the transmit arbitration. This is indicated by interrupt flag ARBLOIF (UI2C_PROTSTS [11]) and can generate a protocol interrupt if enabled by ARBLOIEN (UI2C_PROTIEN [4]).

When the transmit arbitration has been lost, the software has to initialize the complete frame again, starting with the first address byte together with the START condition for a new master transmit attempt. Arbitration also takes place for the ACK bit. If master arbitration lost and match the device address, then master will turn to slave.

6.21.5.8 Transmission Chain

The I²C bus protocol requiring a kind of in-bit-response during the arbitration phase and while a slave is transmitting, the resulting loop delay of the transmission chain can limit the reachable maximal baud rate, strongly depending on the bus characteristics (bus load, module frequency, etc.).

The shift clock SCL is generated by the master device, output on the wire, then it passes through the

input stage and the input filter. Now, the edges can be detected and the SDA data signal can be generated accordingly. The SDA signal passes through the output stage and the wire to the master receiver part. There, it passes through the input stage and the input filter before it is sampled.

This complete loop has to be finished (including all settling times to obtain stable signal levels) before the SCL signal changes again. The delays in this path have to be taken into account for the calculation of the baud rate as a function of f_{PCLK} and f_{PROT_CLK} . We suggest user adopt f_{PCLK} .

6.21.5.9 Non-Acknowledge and Error Conditions

In case of a non-acknowledge (NACKIF (UI2C_PROTSTS [10])) or an error (ERRIF(UI2C_PROTSTS [12])), no further transmission will take place. User software doesn't invalidate the transmit buffer and disable transmissions, before configuring the transmission (by writing TXDAT) again with appropriate values to react on the previous event.

6.21.5.10 I²C Protocol Interrupt Events

The following protocol-related events are generated in I²C mode and can lead to a protocol interrupt.

Please note that the bits in register UI2C_PROTSTS are not all automatically cleared by hardware and have to be cleared by software in order to monitor new incoming events.

- START condition received at a correct position in a frame (STARIF (UI2C_PROTSTS [8]))
- STOP condition transferred at a correct position in a frame (STORIF (UI2C_PROTSTS [9]))
- Master arbitration lost (ARBLOIF (UI2C_PROTSTS [11]))
- Slave read requested (SLAREAD (UI2C_PROTSTS [15]))
- Acknowledge received (ACKIF (UI2C_PROTSTS [13]))
- Non-acknowledge received (NACKIF (UI2C_PROTSTS [10]))
- START condition not at the expected position in a frame (ERRIF (UI2C_PROTSTS [12]))
- STOP condition not at the expected position in a frame (ERRIF (UI2C_PROTSTS [12]))

6.21.5.11 Operating the I2C

To operate the I²C protocol, the following issues have to be considered:

Select I²C Mode

It is recommended to configure all parameters of the I²C that do not change during run time while FUNMODE (UI2C_CTL [2:0]) = 000B. The I²C control flow has to be done while FUNMODE (UI2C_CTL [2:0]) = 000B to avoid unintended edges of the input signals and the I²C mode can be enabled by FUNMODE (UI2C_CTL [2:0]) = 100B afterwards.

Step 1. Set FUNMODE (UI2C_CTL [2:0]) = 000B

Step 2. Set FUNMODE (UI2C_CTL [2:0]) = 100B

Pin Connections

The pins used for SDA and SCL have to be set to open-drain mode by USCI controller to support the wired-AND structure of the I²C bus lines.

Note: The step to enable the alternate output port functions should only be done after the I²C mode is enabled, to avoid unintended spikes on the output.

Bit Timing Configuration

In standard mode (100 kBit/s) a minimum module frequency of 2 MHz is necessary, whereas in fast mode (400 kBit/s) a minimum of 10 MHz is required. Additionally, if the digital filter stage should be used to eliminate spikes up to 50 ns, a filter frequency of 20 MHz is necessary. There could be an uncertainty in the SCL high phase timing of maximum $1/f_{PROT_CLK}$ if another I²C participant lengthens the SCL low phase on the bus. Note that the SCL maximum frequency is $f_{SAMP_CLK}/2$ and the SPCLKSEL

(UI2C_BRGEN [3:2]) must be set to 0 for selecting $f_{SAMP_CLK} = f_{DIV_CLK}$.

Data Format Configuration

The data format has to be configured for 8 data bits (DWIDTH (UI2C_LINECTL [11:8]) = 8), and MSB shifted first (LSB (UI2C_LINECTL [0]) = 0). As a result, UI2C_LINECTL has to be set to 0x800.

Control Flow

The on-chip I²C ports support three operation modes, Master, Slave, and General Call Mode.

In a given application, I²C port may operate as a master or as a slave. In Slave mode, the I²C port hardware looks for its own slave address and the general call address. If one of these addresses is detected, and if the slave is willing to receive or transmit data from/to master (by setting the AA bit), acknowledge pulse will be transmitted out on the 9th clock, hence an interrupt is requested on both master and slave devices if interrupt is enabled. When the microcontroller wishes to become the bus master, hardware waits until the bus is free before entering Master mode so that a possible slave action is not be interrupted. If address arbitration is lost in Master mode, I²C port switches to Slave mode immediately and can detect its own slave address in the same serial transfer.

To control the I²C bus transfer in each mode, user needs to set UI2C_PROTCTL, UI2C_PROTIEN, TXDAT registers according to current status of UI2C_PROTSTS register. In other words, for each I²C bus action, user needs to check current status by UI2C_PROTSTS register, and then set UI2C_PROTCTL, UI2C_PROTIEN, TXDAT registers to take bus action. Finally, check the response status by UI2C_PROTSTS.

The bits, STA, STO and AA in UI2C_PROTCTL register are used to control the next state of the I²C hardware after interrupt signal is cleared. Upon completion of the new action, a new status will be updated in UI2C_PROTSTS register will be set. If the I²C interrupt control bit of UI2C_PROTIEN is set, appropriate action or software branch of the new status can be performed in the Interrupt service routine.

Figure 6.21-8 shows the current I²C STARIF (UI2C_PROTSTS [8]) is set to 1 by hardware, and then set TXDAT = SLA+W (Slave address + Write bit), (PTRG, STA, STO, AA) = (1, 0, 0, x) to send the address to I²C bus, and write 1 to STARIF (UI2C_PROTSTS [8]) to clear flag. If a slave on the bus matches the address and response ACK, the UI2C_PROTSTS will be updated by ACKIF (UI2C_PROTSTS [13]) setting.

Figure 6.21-8 Control I²C Bus according to Current I²C Status

Data Transfer on the I²C Bus

Figure 6.21-9 shows a master transmits data to slave. A master addresses a slave with a 7-bit address and 1-bit write index to denote that the master wants to transmit data to the slave. The master keeps transmitting data after the slave returns acknowledge to the master.

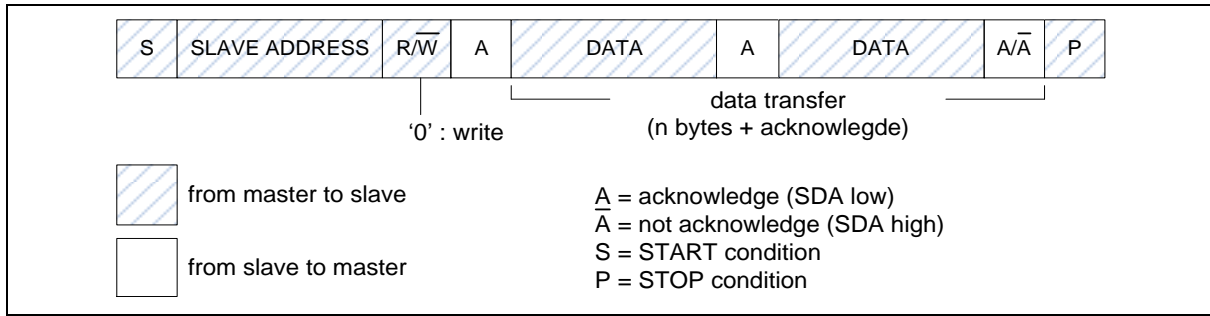

Figure 6.21-9 Master Transmits Data to Slave with a 7-bit Address

Figure 6.21-10 shows a master read data from slave. A master addresses a slave with a 7-bit address and 1-bit read index to denote that the master wants to read data from the slave. The slave will start transmitting data after the slave returns acknowledge to the master.

Figure 6.21-10 Master Reads Data from Slave with a 7-bit Address

Figure 6.21-11 shows a master transmits data to slave by 10-bit address. A master addresses a slave with a 10-bit address. First byte contains 10-bit address indicator (5'b11110) and 2-bit address with write index, second byte contains 8-bit address. The master keeps transmitting data after the second byte end. Note that 7-bit and 10-bit address device can work on the same bus.

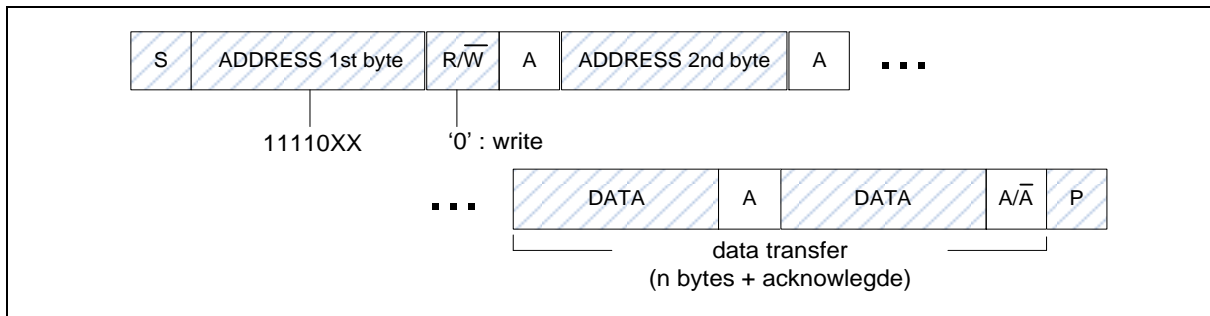

Figure 6.21-11 Master Transmits Data to Slave by 10-bit Address

Figure 6.21-12 shows a master read data from slave by 10-bit address. A master addresses a slave with a 10-bit address. First master transmits 10-bit address to slave, after that master transmits first byte with read index. The slave will start transmitting data after the first byte with read index.

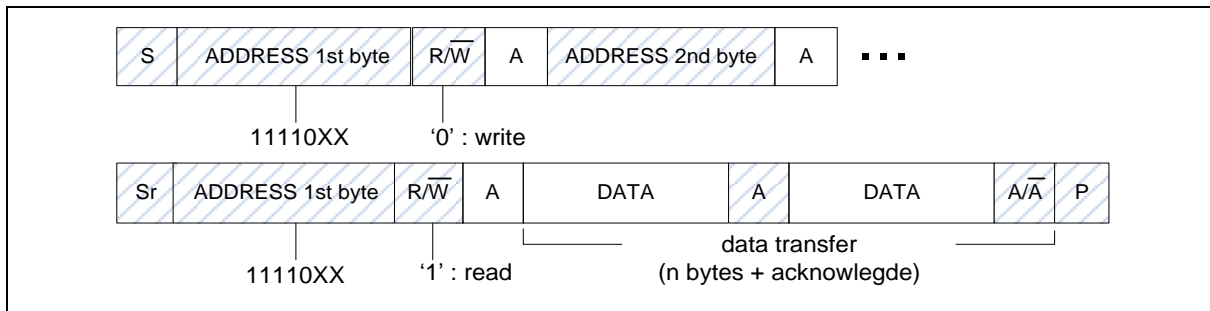

Figure 6.21-12 Master Reads Data from Slave by 10-bit Address

Master Mode

In Figure 6.21-13 and Figure 6.21-14, all possible protocols for I²C master are shown. User needs to follow proper path of the flow to implement required I²C protocol.

In other words, user can send a START signal to bus and I²C will be in Master Transmitter mode (Figure 6.21-13) or Master receiver mode (Figure 6.21-14) after START signal has been sent successfully and new status register would be set STARIF (UI2C_PROTSTS [8]). Followed by START signal, user can send slave address, read/write bit, data and Repeat START, STOP to perform I²C protocol.

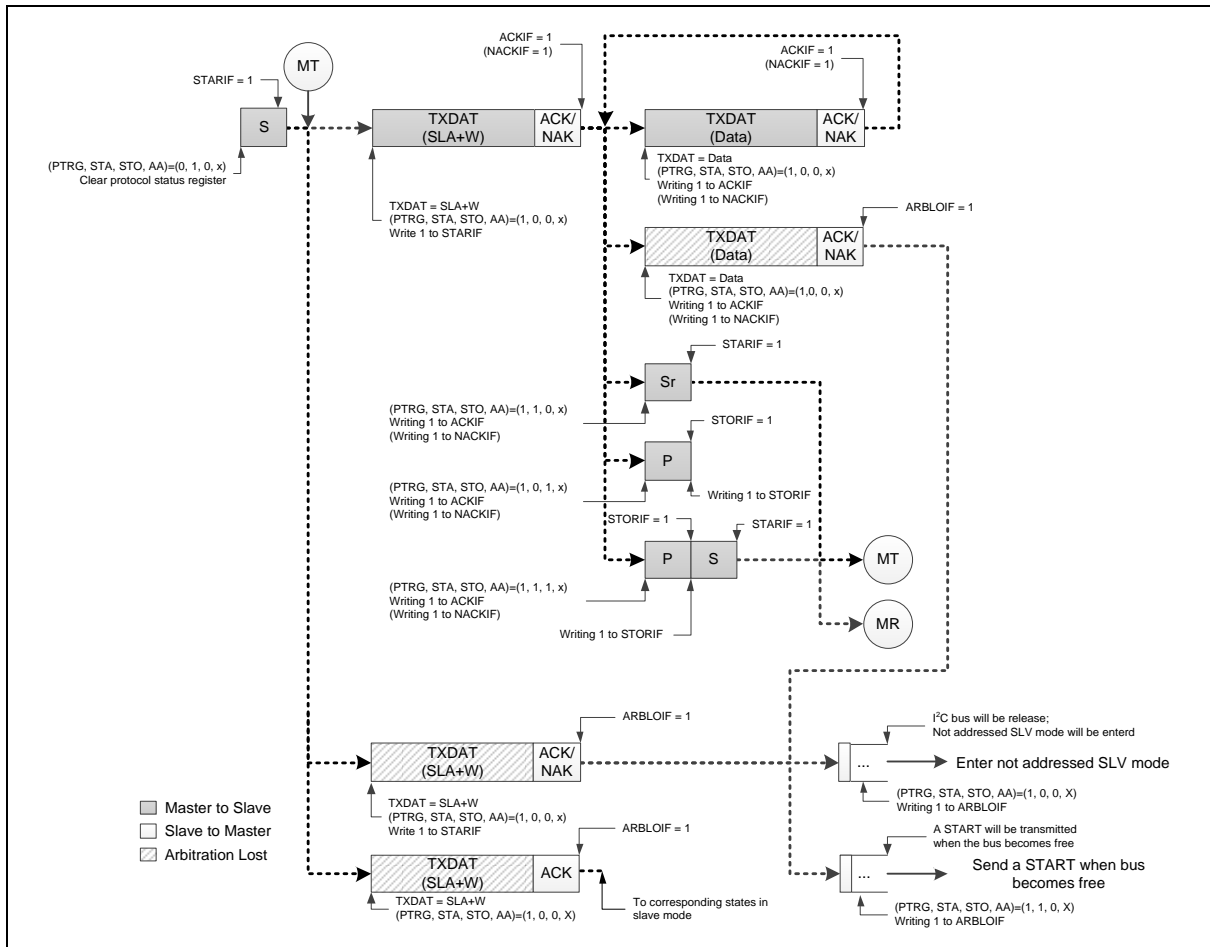

Figure 6.21-13 Master Transmitter Mode Control Flow with 7-bit Address

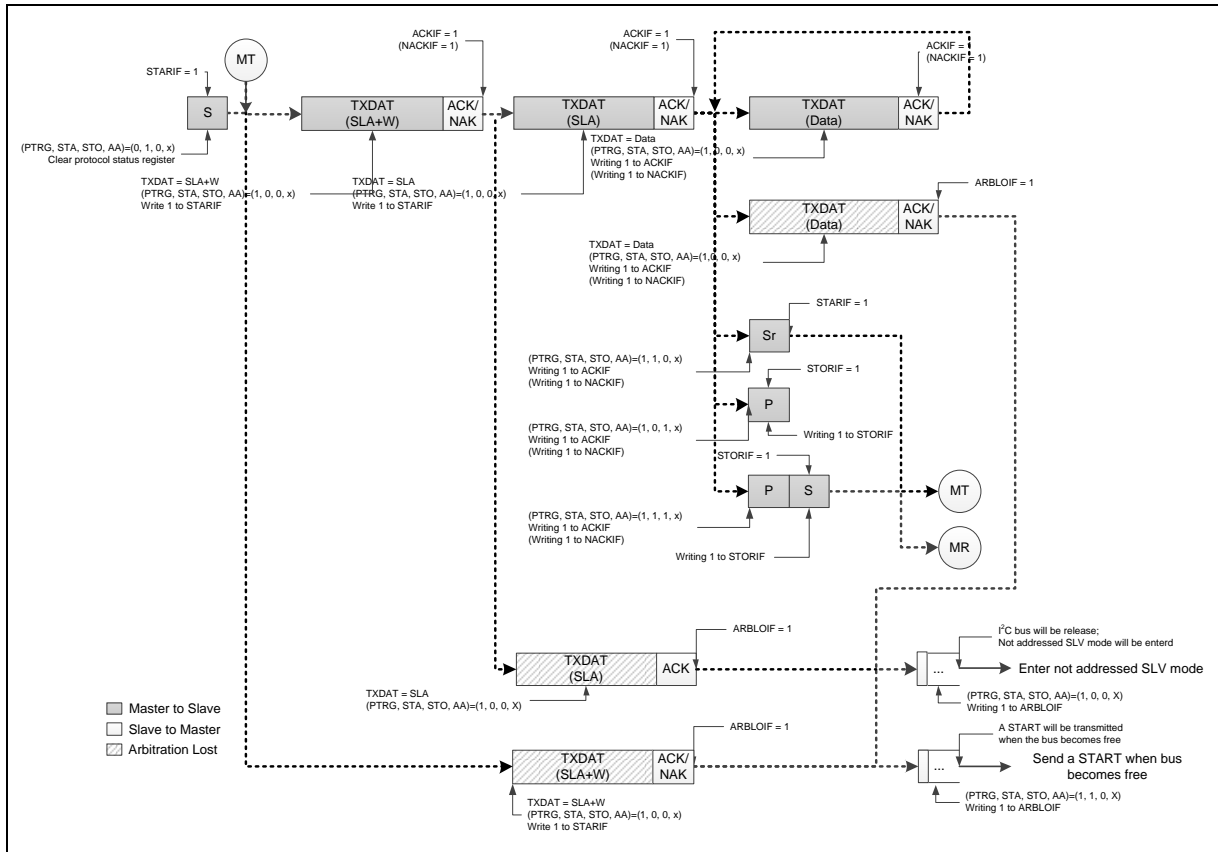

Figure 6.21-15 Master Transmitter Mode Control Flow with 10-bit Address

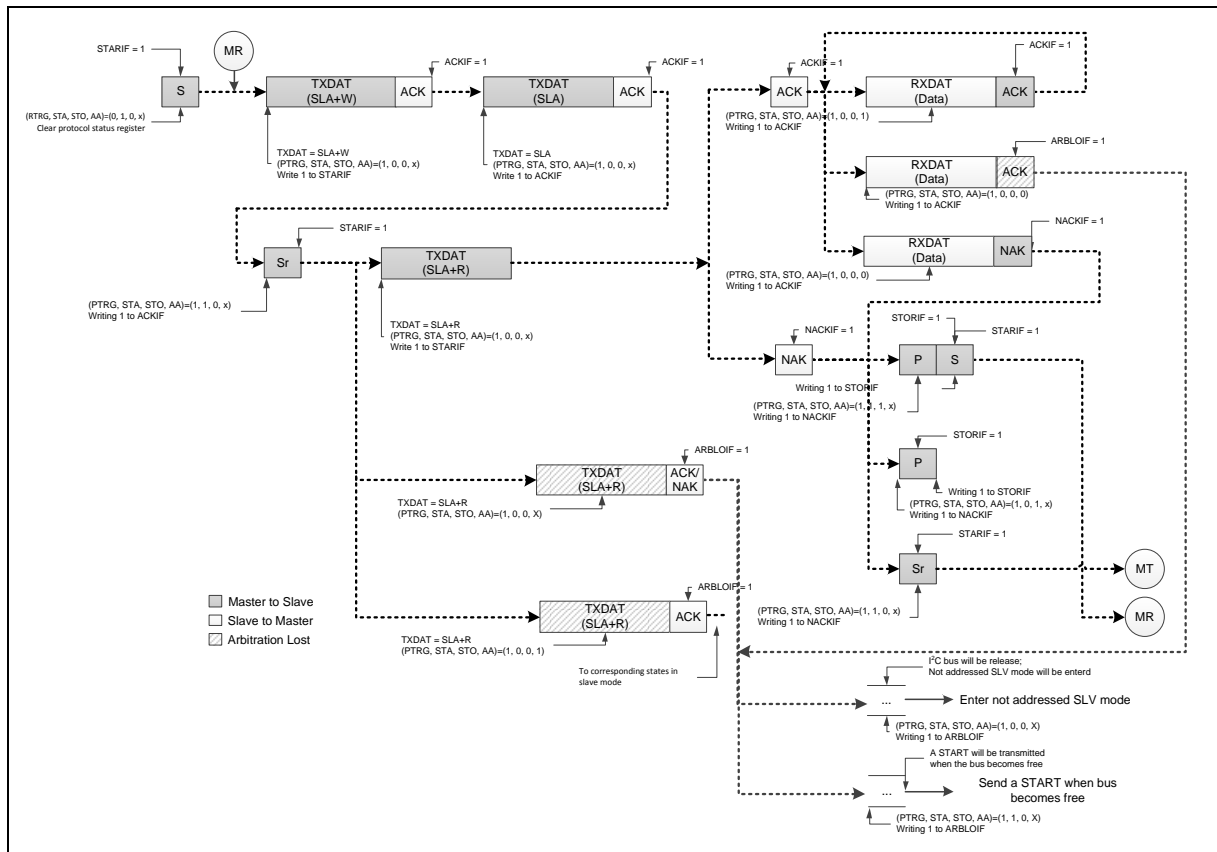

Figure 6.21-16 Master Receiver Mode Control Flow with 10-bit Address

If the I²C is in Master mode and gets arbitration lost, the bit of ARBLOIF (UI2C_PROTSTS [11]) will be set. User may writing 1 to ARBLOIF (UI2C_PROTSTS [11]) and set (PTRG, STA, STO, AA) = (1, 1, 0, X) to send START to re-start Master operation when bus becomes free. Otherwise, user may write 1 to ARBLOIF (UI2C_PROTSTS [11]) and set (PTRG, STA, STO, AA) = (1, 0, 0, X) to release I²C bus and enter not addressed Slave mode.

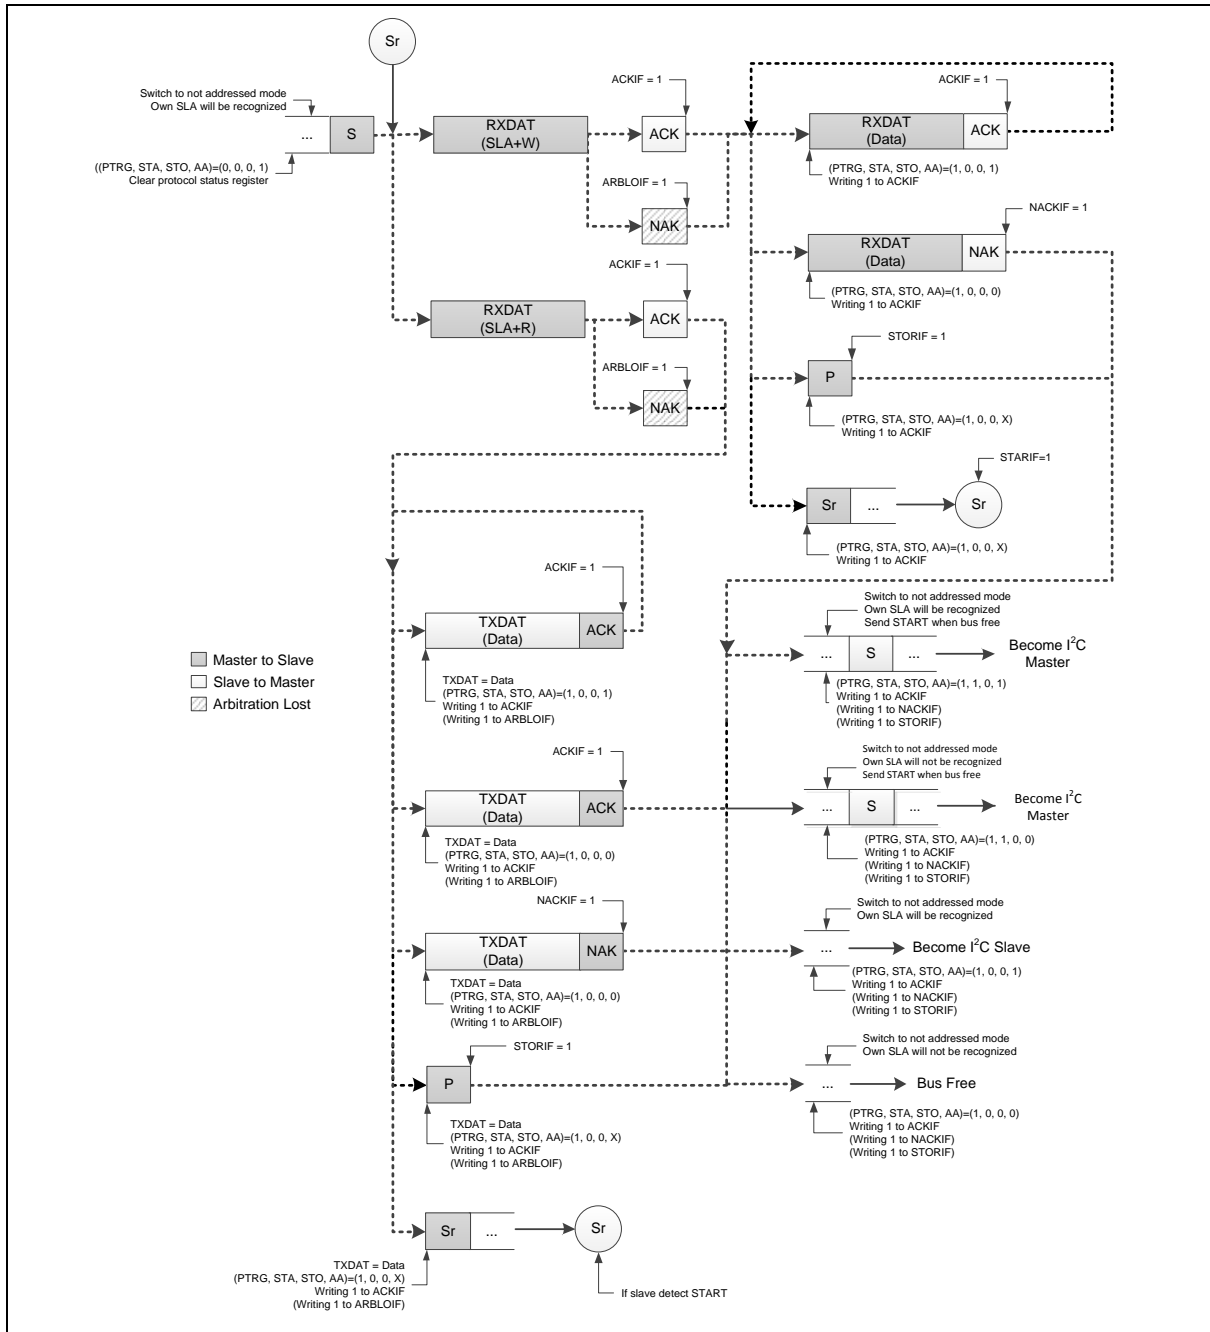

Slave Mode

When reset, I²C is not addressed and will not recognize the address on I²C bus. User can set device address by UI2C_DEVADDRn and set (PTRG, STA, STO, AA) = (1, 0, 0, 1) to let I²C recognize the address sent by master. Figure 6.21-17 shows all the possible flow for I²C in Slave mode. Users need to follow a proper flow (as shown in Figure 6.21-17) to implement their own I²C protocol.

If bus arbitration is lost in Master mode, I²C port switches to Slave mode immediately and can detect its own slave address in the same serial transfer. If the detected address is SLA+W (Master want to write data to Slave) or SLA+R (Master wants to read data from Slave) after arbitration lost, the ARBLOIF will be set to 1.

The I²C controller supports two slave address match flags, ADMAT0 and ADMAT1 on UI2C_ADMAT[1:0] register. Every control register represents which address is used and set 1 to inform software.

Note: During I²C communication, the SCL clock will be released when writing ‘1’ to PTRG (UI2C_PROTCTL [5]) in Slave mode.

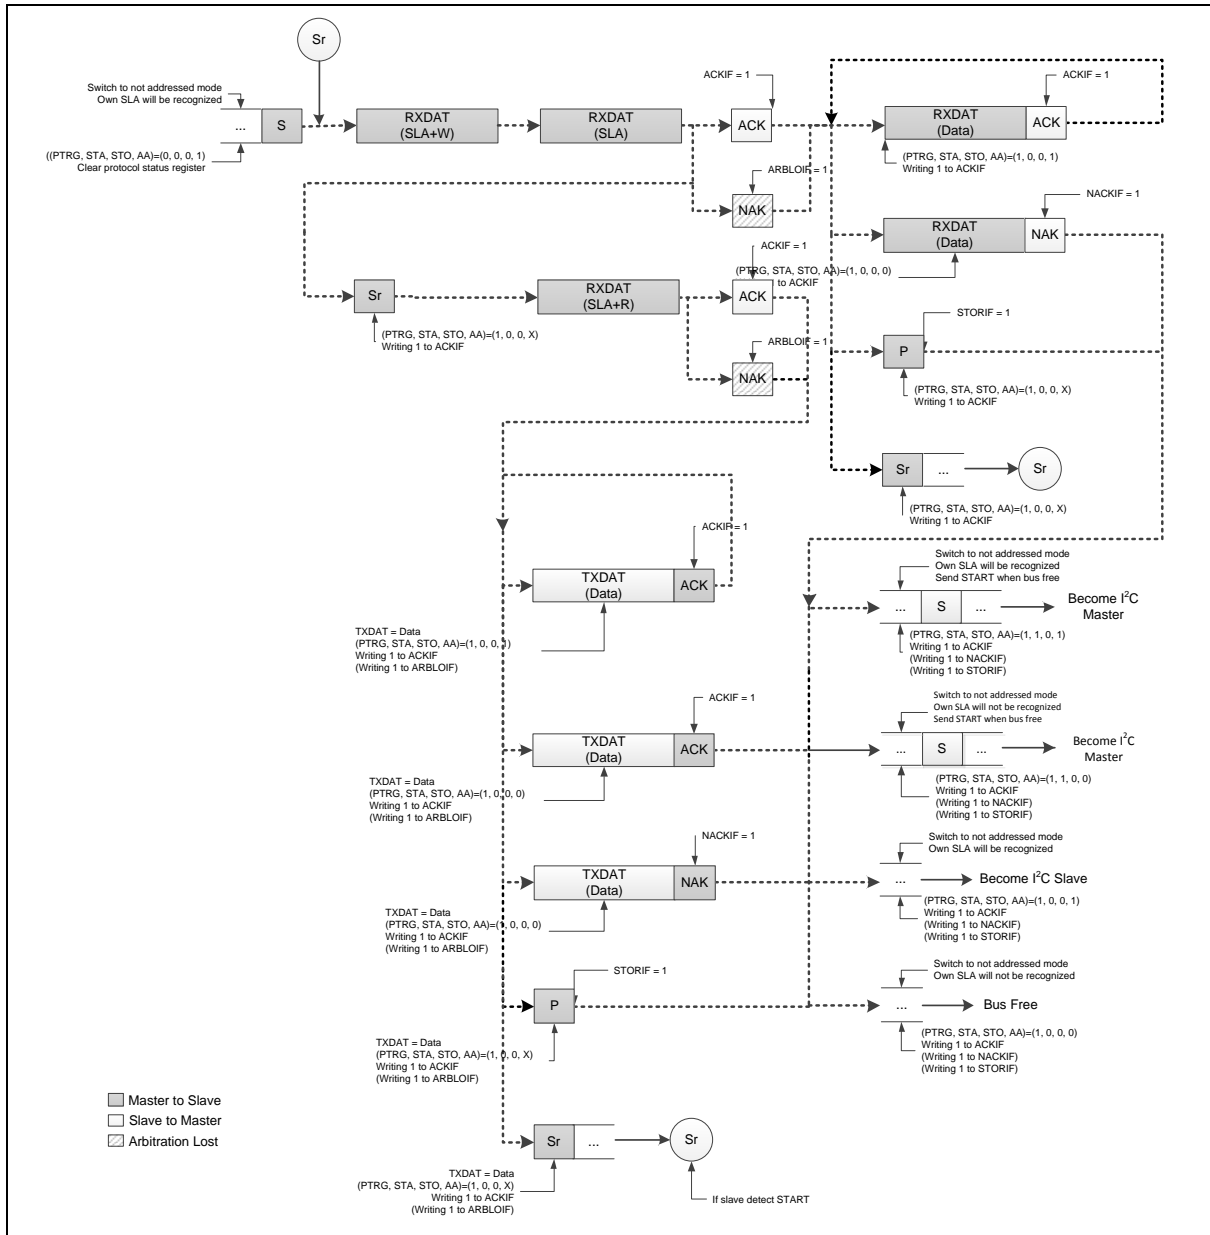

Figure 6.21-18 Save Mode Control Flow with 10-bit Address

If I²C is still transmitting and receiving data in addressed Slave mode but got a STOP or Repeat START, the register STORIF (UI2C_PROTSTS [9]) or STARIF (UI2C_PROTSTS [8]) will be set. User could follow the action for NACKIF (UI2C_PROTSTS [10]) as shown in the above figure when got STARIF (UI2C_PROTSTS [8]) is set.

Note: After slave gets interrupt flag of NACKIF (UI2C_PROTSTS [10]) and start/stop symbol including STARIF (UI2C_PROTSTS [8]) and STORIF (UI2C_PROTSTS [9]), slave can switch to not address mode and own SLA will not be recognized. If setting this interrupt flag, slave will not receive any I²C signal or address from master. At this status, I²C should be reset by setting FUNMODE (UI2C_CTL [2:0]) = 000B to leave this status.

General Call (GC) Mode

If the GCFUNC bit (UI2C_PROTCTL [0]) is set, the I²C port hardware will respond to General Call address (00H). User can clear GC bit to disable general call function. When the GC bit is set and the I²C

in slave mode, it can receive the general call address by 0x00 after master send general call address to I²C bus, and then it also will follow protocol status register.

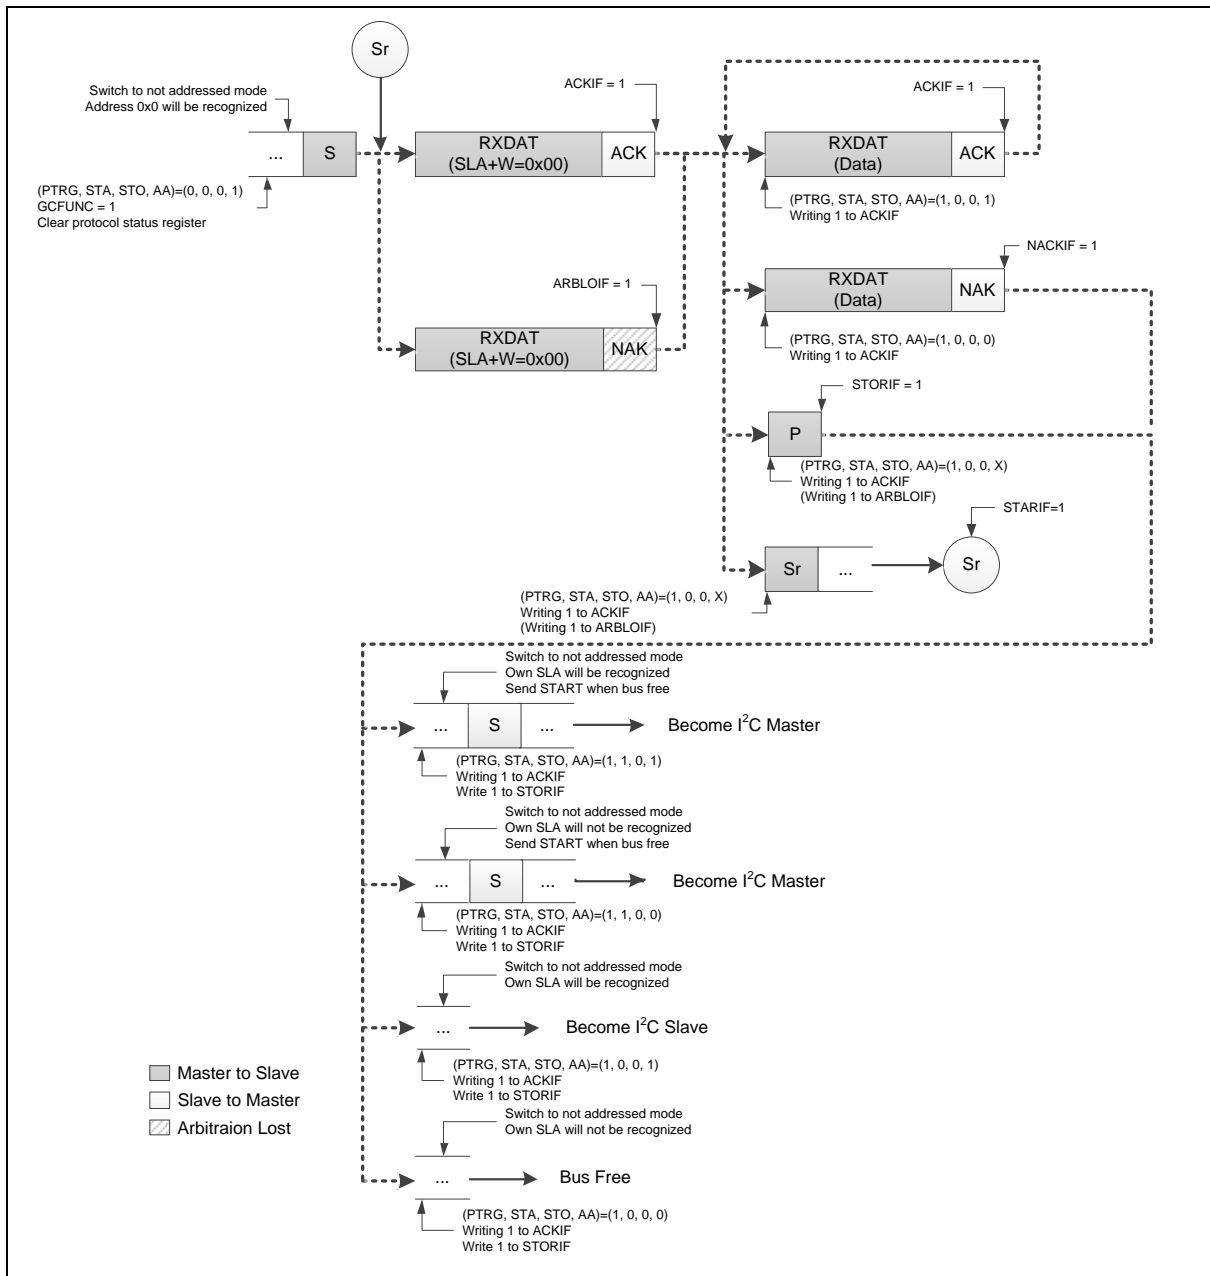

Figure 6.21-19 GC Mode with 7-bit Address

If I²C is still receiving data in GC mode but got a STOP or Repeat START, the STORIF (UI2C_PROTSTS [9]) or STARIF (UI2C_PROTSTS [8]) will be set. User could follow the action for NACKIF (UI2C_PROTSTS [10]) in above figure when got STORIF (UI2C_PROTSTS [9]) or STARIF (UI2C_PROTSTS [8]) is set.

Note: After slave gets interrupt flag of NACKIF (UI2C_PROTSTS [10]) and start/stop symbol including STARIF (UI2C_PROTSTS [8]) and STORIF (UI2C_PROTSTS [9]), slave can switch to not address mode and own SLA will not be recognized. If setting this interrupt flag, slave will not receive any I²C signal or address from master. At this time, I²C controller should be reset by setting FUNMODE (UI2C_CTL [2:0]) = 000B to leave this status.

Protocol Functional Description

Monitor Mode

When I²C enters monitor mode, this device always returns NACK to master after each frame reception even address matching. Moreover, this device will store any receive data including address, command code, and data.

Interrupt in Monitor Mode

All interrupts will occur as normal process when the MONEN (UI2C_PROTCTL [9]) is set. Note that the first interrupt will occur when initial START, it not the same as I²C slave, but the other interrupts are the same.

Subsequent to the address-match detection, interrupts will be generated after each data byte is received as slave mode control flow, or after each byte that the module believes it has transmitted for a slave-read transfer. In this second case, the data register will actually contain data transmitted by some other slave on the bus which was actually addressed by the master. If user wants to watch other device, user can set address mask and monitor.

If the monitor has not had time to respond to interrupt, the SCL signal will be pulled to low when SCLOUTEN (UI2C_PROTCTL [8]) is set to 1. User must set PTRG (UI2C_PROTCTL [5]) to release bus when SCLOUTEN (UI2C_PROTCTL [8]) is set to 1. If SCLOUTEN (UI2C_PROTCTL [8]) is not set to 1, user doesn't need to set PTRG (UI2C_PROTCTL [5]) to 1.

When device address match, but the device response NACK, this address will be received into buffer and NACK interrupt will be generated.

Following all of these interrupts, the processor may read the data register to see what was actually transmitted on the bus.

Loss of Arbitration in Monitor Mode

In monitor mode, the I²C module will not be able to respond to a request for information by the bus master or issue an ACK. Some other slave on the bus will respond instead. Software should be aware of the fact that the module is in monitor mode and should not respond to any loss of arbitration state that is detected.

Programmable Setup and Hold Time

In order to guarantee a correct data setup and hold time, the timing must be configured. By programming HTCTL (UI2C_TMCTL[24:16]) to configure hold time and STCTL (UI2C_TMCTL[8:0]) to configure setup time.

The delay timing refer peripheral clock (PCLK). When device stretch master clock, the setup and hold time configuration value will not affected by stretched.

User should focus the limitation of setup and hold time configuration, the timing setting must follow I²C protocol. Once setup time configuration greater than design limitation, that means if setup time setting make SCL output less than three PCLKs, I²C controller can't work normally due to SCL must sample three times. And once hold time configuration greater than I²C clock limitation, I²C will occur bus error. Suggest that user calculate suitable timing with baud rate and protocol before setting timing. Table 6.21-1 shows the relationship between I²C baud rate and PCLK, the number of table represent one clock duty contain how many PCLKs. Setup and hold time configuration even can program some extreme values in the design, but user should follow I²C protocol standard.

I ² C Baud Rate PCLK	100k	200k	400k	800k	1200k
12 MHz	120	60	30	15	10
24 MHz	240	120	60	30	20

48 MHz	480	240	120	60	40
72 MHz	720	360	180	90	60

Table 6.21-1 Relationship between I²C Baud Rate and PCLK

For setup time wrong adjustment example, assuming one SCL cycle contains ten PCLKs and set STCTL (UI2C_TMCTL[8:0]) to 3 that stretch three PCLKs for setup time setting. The setup time setting limitation: $ST_{limit} = (UI2C_BRGEN[25:16]+1) - 6$.

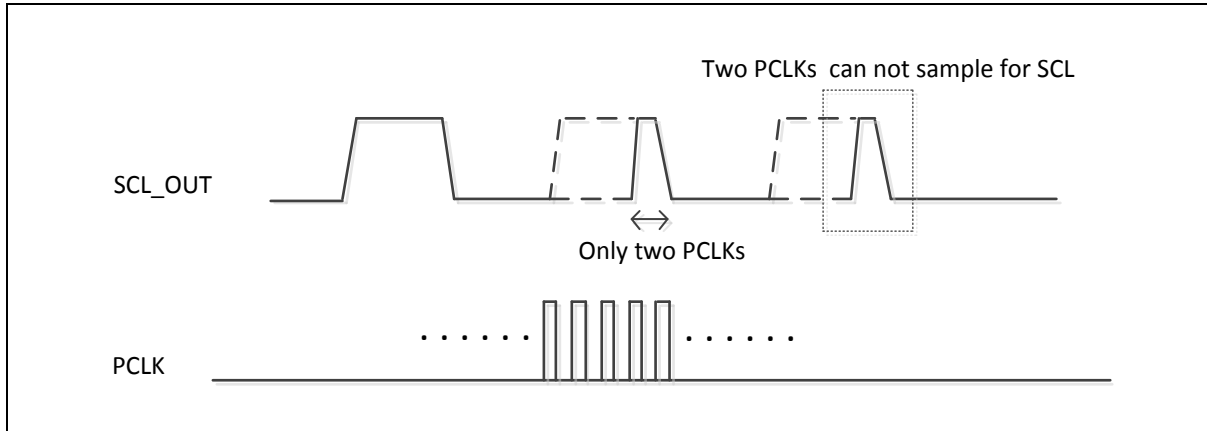

Figure 6.21-20 Setup Time Wrong Adjustment

For hold time wrong adjustment example, use I²C Baud Rate = 1200k and PCLK = 72 MHz, the SCL high/low duty = 60 PCLK. When HTCTL (UI2C_TMCTL[24:16]) is set to 63 and STCTL (UI2C_TMCTL[8:0]) is set to 0, then SDA output delay will over SCL high duty and cause bus error. The hold time setting limitation: $HT_{limit} = (UI2C_BRGEN[25:16]+1) - 9$.

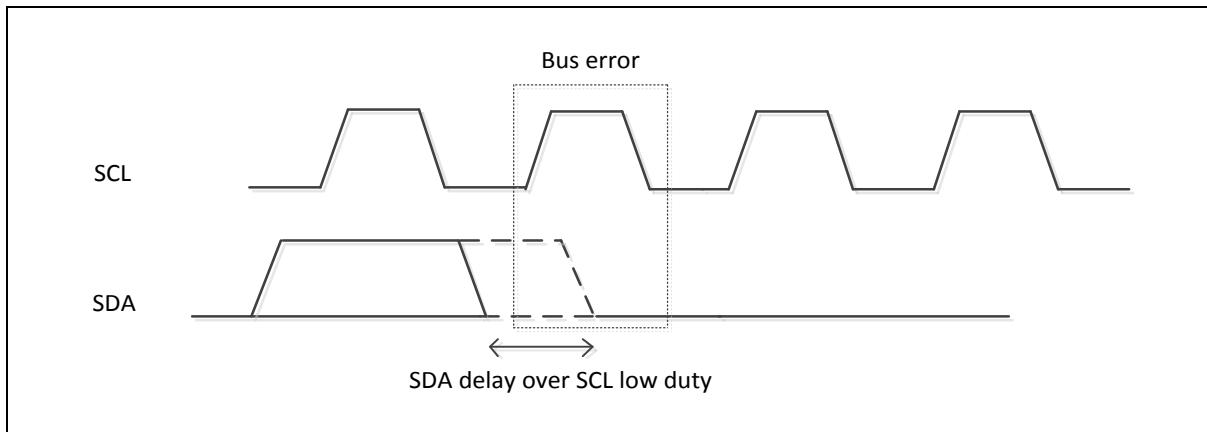

Figure 6.21-21 Hold Time Wrong Adjustment

I²C Time-out Function

There is a 10 bits time-out counter TOCNT (UI2C_PROTCTL [25:16]) which can be used to deal with the I²C bus hang-up. If the time-out counter is enabled, the counter starts up counting until it equals TOCNT (UI2C_PROTCTL [25:16]) and generates I²C interrupt to CPU or stops counting by clearing TOIEN (UI2C_PROTIEN [0]) to 0 or setting all I²C interrupt signal (ACKIF, ERRIF, ARBLOIF, NACKIF, STORIF, STARIF). User may write 1 to clear TOIF(UI2C_PROTSTS[5]) to 0. When time-out counter is enabled, writing 1 to the TOIF will reset counter and re-start up counting after TOIF is cleared. Refer to Figure 6.21-22 for the time-out counter TOCNT (UI2C_PROTCTL [25:16]). $T_{TOCNT} = (TOCNT (UI2C_PROTCTL [25:16]) + 1) \times 32 (5\text{-bit}) \times T_{PCLK}$. Note that the time counter clock source TMCNTSRC

(UI2C_BRGEN [5]) must be set as 0.

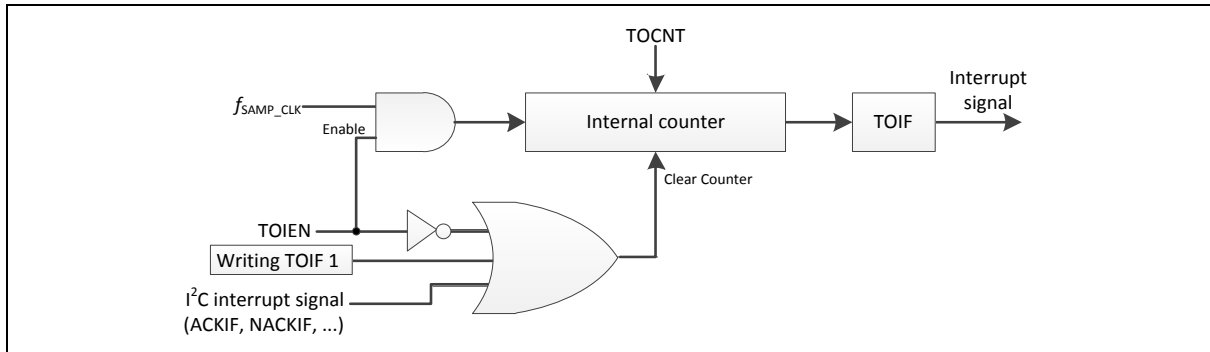

Figure 6.21-22 I²C Time-out Count Block Diagram

Wake-up Function

When chip enters Power-down mode and sets WKEN (WKCTL[0]) to 1, other I²C master can wake up the chip by addressing the I²C device. User must configure the related setting before entering sleep mode. The ACK bit cycle of address match frame is done in power-down. The controller will stretch the SCL to low when the address is matched the device's address and the ACK cycle done. The SCL is stretched until the bit is clear by user. If the frequency of SCL is low speed and the system has wakeup from address match frame, the user shall check this bit to confirm this frame has transaction done and then to do the wake-up procedure. Therefore, when the chip is woken up by address match with one of the device address register (UI2C_DEVADDRn), the user shall check the WKAKDONE (UI2C_PROTSTS [16]) bit is set to 1 to confirm if the address wakeup frame has been done. The WKAKDONE bit indicates that the ACK bit cycle of address match frame is done in power-down. The controller will stretch the SCL to low when the address is matched the device's slave address and the ACK cycle done. The SCL is stretched until the WKAKDONE bit is clear by user. If the frequency of SCL is low speed and the system has wakeup from address match frame, the user shall check this bit to confirm this frame has transaction done and then to do the wake-up procedure. Note that user must clear WKUPIF after clearing the WKAKDONE bit to 0.

The WRSTSWK (UI2C_PROTSTS [17]) bit records the Read/Write command on the address match wake-up frame. The user can use read this bit's status to prepare the next transmitted data (WRSTSWK = 0) or to wait the incoming data (WRSTSWK = 1) can be stored in time after the system is woken up by the address match frame.

When system is woken up by other I²C master device, WKF (UI2C_WKSTS [0]) is set to indicate this event. User needs write "1" to clear this bit.

Example for Random Read on EEPROM

The following steps are used to configure the USCI0_I2C related registers when using I²C protocol to read data from EEPROM.

1. Set USCI0_I2C the multi-function pin as SCL and SDA pins. The multi-function configuration reference Basic Configuration.
2. Enable USCI0 APB clock. The multi-function configuration reference Basic Configuration.
3. Set USCI0RST=1 to reset USCI controller then set USCI0RST=0 let USCI controller to normal operation. The reset controller configuration reference Basic Configuration.
4. Set FUNMODE =100 to enable USCI0_I2C controller in the "UI2C_CTL" register.
5. Give USCI0_I2C clock a divided register value for USCI0_I2C clock rate in the "UI2C_BRGEN".
6. Enable system I2C0 IRQ in system "NVIC" control register.
7. Set ACKIEN, ERRIEN, ARBLOIEN, NACKIEN, STORIEN, STARIEN, and TOIEN to enable I²C Interrupt in the "UI2C_PROTIEN" register.

8. Set USCI address registers “UI2C_ADDR0 ~ UI2C_ADDR1”.

Random read operation is one of the methods of access EEPROM. The method allows the master to access any address of EEPROM space. Figure 6.21-23 shows the EEPROM random read operation.

Figure 6.21-23 EEPROM Random Read

Figure 6.21-24 shows how to use I²C controller to implement the protocol of EEPROM random read.

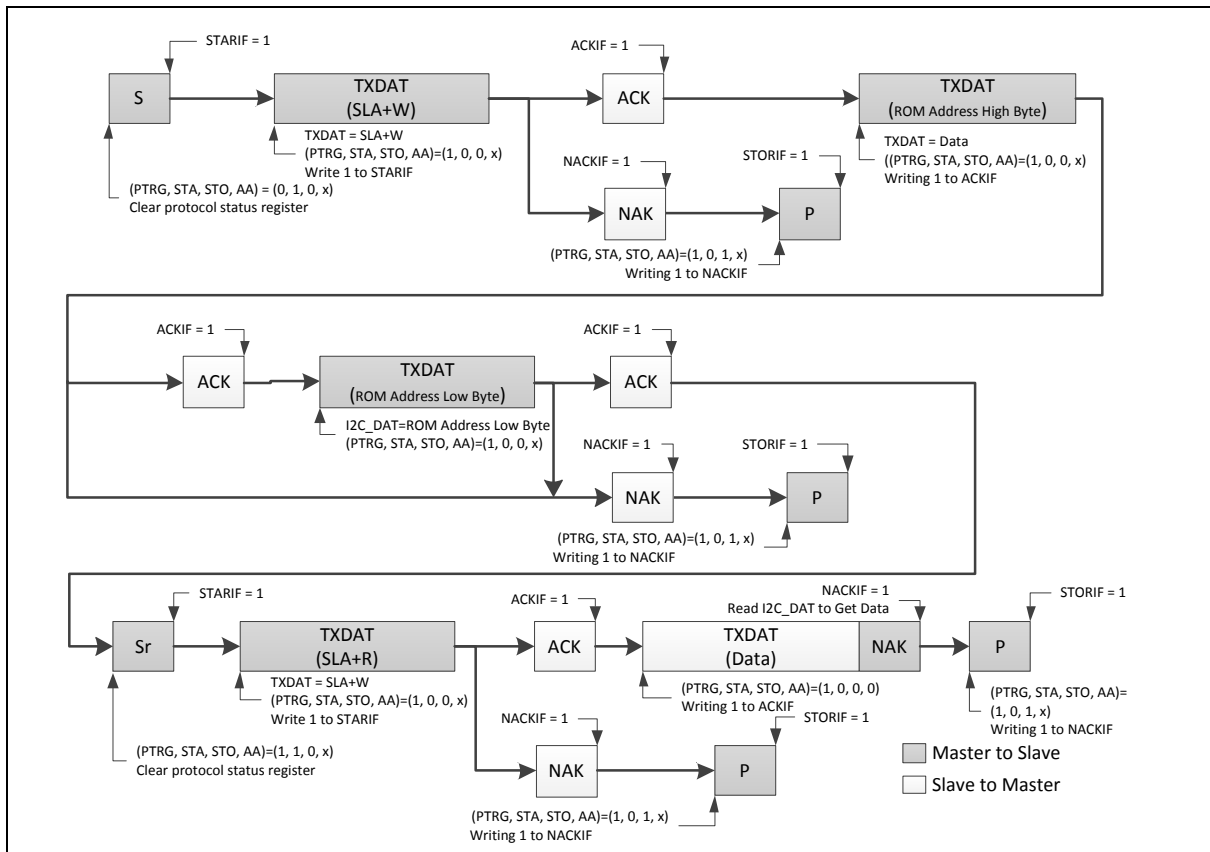

Figure 6.21-24 Protocol of EEPROM Random Read

The I²C controller, which is a master, sends START to bus. Then, it sends a SLA+W (Slave address + Write bit) to EEPROM followed by two bytes data address to set the EEPROM address to read. Finally, a Repeat START followed by SLA+R is sent to read the data from EEPROM.

6.21.6 Register Map

R: read only, W: write only, R/W: both read and write

Bits	Description	
[31]	PROTEN	I²C Protocol Enable Bit 0 = I ² C Protocol Disabled. 1 = I ² C Protocol Enabled.
[30:26]	Reserved	Reserved.
[25:16]	TOCNT	Time-out Clock Cycle This bit field indicates how many clock cycle selected by TMCNTSRC (UI2C_BRGEN [5]) when each interrupt flags are clear. The time-out is enable when TOCNT bigger than 0. Note: The TMCNTSRC (UI2C_BRGEN [5]) must be set zero on I ² C mode.
[15:10]	Reserved	Reserved.
[9]	MONEN	Monitor Mode Enable Bit This bit enables monitor mode. In monitor mode the SDA output will be put in high impedance mode. This prevents the I ² C module from outputting data of any kind (including ACK) onto the I ² C data bus. 0 = The monitor mode Disabled. 1 = The monitor mode Enabled. Note: Depending on the state of the SCLOUTEN bit, the SCL output may be also forced high, preventing the module from having control over the I ² C clock line.
[8]	SCLOUTEN	SCL Output Enable Bit This bit enables monitor pulling SCL to low. This monitor will pull SCL to low until it has had time to respond to an I ² C interrupt. 0 = SCL output will be forced high due to open drain mechanism. 1 = I ² C module may act as a slave peripheral just like in normal operation, the I ² C holds the clock line low until it has had time to clear I ² C interrupt.
[7:6]	Reserved	Reserved.

[5]	PTRG	<p>I²C Protocol Trigger (Write Only)</p> <p>When a new state is present in the UI2C_PROTSTS register, if the related interrupt enable bits are set, the I²C interrupt is requested. It must write one by software to this bit after the related interrupt flags are set to 1 and the I²C protocol function will go ahead until the STOP is active or the PROTEN is disabled.</p> <p>0 = I2C's stretch disabled and the I²C protocol function will go ahead. 1 = I2C's stretch active.</p>
[4]	ADDR10EN	<p>Address 10-bit Function Enable Bit</p> <p>0 = Address match 10 bit function Disabled. 1 = Address match 10 bit function Enabled.</p>
[3]	STA	<p>I²C START Control</p> <p>Setting STA to logic 1 to enter Master mode, the I²C hardware sends a START or repeat START condition to bus when the bus is free.</p>
[2]	STO	<p>I²C STOP Control</p> <p>In Master mode, setting STO to transmit a STOP condition to bus then I²C hardware will check the bus condition if a STOP condition is detected this bit will be cleared by hardware automatically. In a slave mode, setting STO resets I²C hardware to the defined "not addressed" slave mode when bus error (UI2C_PROTSTS.ERRIF = 1).</p>
[1]	AA	<p>Assert Acknowledge Control</p> <p>When AA =1 prior to address or data received, an acknowledged (low level to SDA) will be returned during the acknowledge clock pulse on the SCL line when 1.) A slave is acknowledging the address sent from master, 2.) The receiver devices are acknowledging the data sent by transmitter. When AA=0 prior to address or data received, a Not acknowledged (high level to SDA) will be returned during the acknowledge clock pulse on the SCL line.</p>
[0]	GCFUNC	<p>General Call Function</p> <p>0 = General Call Function Disabled. 1 = General Call Function Enabled.</p>

Reserved	ONBUSY	TOIF	Reserved				

Bits	Description
[31:20]	Reserved Reserved.
[19]	ERRARBLO Error Arbitration Lost This bit indicates bus arbitration lost due to bigger noise which is can't be filtered by input processor. The I ² C can send start condition when ERRARBLO is set. Thus this bit doesn't be cared on slave mode. 0 = The bus is normal status for transmission. 1 = The bus is error arbitration lost status for transmission. Note: This bit has no interrupt signal, and it will be cleared automatically by hardware when a START condition is present.
[18]	BUSHANG Bus Hang-up This bit indicates bus hang-up status. There is 4-bit counter count when SCL hold high and refer f _{SAMP_CLK} . The hang-up counter will count to overflow and set this bit when SDA is low. The counter will be reset by falling edge of SCL signal. 0 = The bus is normal status for transmission. 1 = The bus is hang-up status for transmission. Note: This bit has no interrupt signal, and it will be cleared automatically by hardware when a START condition is present.
[17]	WRSTSWK Read/Write Status Bit in Address Wake-up Frame 0 = Write command is recorded on the address match wake-up frame. 1 = Read command is recorded on the address match wake-up frame.
[16]	WKAKDONE Wake-up Address Frame Acknowledge Bit Done 0 = The ACK bit cycle of address match frame isn't done. 1 = The ACK bit cycle of address match frame is done in power-down. Note: This bit can't release when WKUPIF is set.
[15]	SLAREAD Slave Read Request Status This bit indicates that a slave read request has been detected. 0 = A slave R/W bit is 1 has not been detected. 1 = A slave R/W bit is 1 has been detected.

		Note: This bit has no interrupt signal, and it will be cleared automatically by hardware.
[14]	SLASEL	<p>Slave Select Status</p> <p>This bit indicates that this device has been selected as slave.</p> <p>0 = The device is not selected as slave.</p> <p>1 = The device is selected as slave.</p> <p>Note: This bit has no interrupt signal, and it will be cleared automatically by hardware.</p>
[13]	ACKIF	<p>Acknowledge Received Interrupt Flag</p> <p>This bit indicates that an acknowledge has been received in master mode. A protocol interrupt can be generated if UI2C_PROTCTL.ACKIEN = 1.</p> <p>0 = An acknowledge has not been received.</p> <p>1 = An acknowledge has been received.</p> <p>Note: It is cleared by software writing 1 into this bit.</p>
[12]	ERRIF	<p>Error Interrupt Flag</p> <p>This bit indicates that a Bus Error occurs when a START or STOP condition is present at an illegal position in the formation frame. Example of illegal position are during the serial transfer of an address byte, a data byte or an acknowledge bit. A protocol interrupt can be generated if UI2C_PROTCTL.ERRIEN = 1.</p> <p>0 = An I²C error has not been detected.</p> <p>1 = An I²C error has been detected.</p> <p>Note 1: It is cleared by software writing 1 into this bit</p> <p>Note 2: This bit is set for slave mode, and user must write 1 into STO register to the defined "not addressed" slave mode.</p>
[11]	ARBLOIF	<p>Arbitration Lost Interrupt Flag</p> <p>This bit indicates that an arbitration has been lost. A protocol interrupt can be generated if UI2C_PROTCTL.ARBLOIEN = 1.</p> <p>0 = An arbitration has not been lost.</p> <p>1 = An arbitration has been lost.</p> <p>Note: It is cleared by software writing 1 into this bit.</p>
[10]	NACKIF	<p>Non - Acknowledge Received Interrupt Flag</p> <p>This bit indicates that a non - acknowledge has been received in master mode. A protocol interrupt can be generated if UI2C_PROTCTL.NACKIEN = 1.</p> <p>0 = A non - acknowledge has not been received.</p> <p>1 = A non - acknowledge has been received.</p> <p>Note: It is cleared by software writing 1 into this bit.</p>
[9]	STORIF	<p>Stop Condition Received Interrupt Flag</p> <p>This bit indicates that a stop condition has been detected on the I²C bus lines. A protocol interrupt can be generated if UI2C_PROTCTL.STORIEN = 1.</p> <p>0 = A stop condition has not yet been detected.</p> <p>1 = A stop condition has been detected.</p> <p>Note 1: It is cleared by software writing 1 into this bit.</p>
[8]	STARIF	<p>Start Condition Received Interrupt Flag</p> <p>This bit indicates that a start condition or repeated start condition has been detected on master mode. However, this bit also indicates that a repeated start condition has been detected on slave mode.</p> <p>A protocol interrupt can be generated if UI2C_PROTCTL.STARIEN = 1.</p> <p>0 = A start condition has not yet been detected.</p> <p>1 = A start condition has been detected.</p> <p>Note: It is cleared by software writing 1 into this bit.</p>
[7]	Reserved	Reserved.

[6]	ONBUSY	<p>On Bus Busy</p> <p>Indicates that a communication is in progress on the bus. It is set by hardware when a START condition is detected. It is cleared by hardware when a STOP condition is detected</p> <p>0 = The bus is IDLE (both SCLK and SDA High).</p> <p>1 = The bus is busy.</p>
[5]	TOIF	<p>Time-out Interrupt Flag</p> <p>0 = A time-out interrupt status has not occurred.</p> <p>1 = A time-out interrupt status has occurred.</p> <p>Note: It is cleared by software writing 1 into this bit</p>
[4:0]	Reserved	Reserved.

6.22 Programmable Serial IO (PSIO)

6.22.1 Overview

Programmable Serial I/O (PSIO) provides a simple way to implement simple serial signal processing, e.g. UART and IR. The PSIO can control when the pin will output high or low and how long the pin need to output high or low. It also provides the easy way to sample the pin state.

6.22.2 Features

- Supports up to 8 PSIO pins, from PSIO pin0 to PSIO pin7
- Supports 6 clock sources, they are HXT, LXT, HIRC, LIRC, PLL, PCLK1
- Supports one clock divider, which can be divided from 1 to 255
- Supports slot controller for timing sequence control
 - Supports 4 slot controllers, 8 slots in each slot controller
 - Supports counting from 1 PSIO clock to 15 PSIO clocks in each slot
 - Supports 3 slot repeat modes:
 - ◆ Normal repeat mode
 - ◆ Normal repeat mode with infinity loops
 - ◆ Whole repeat mode
 - Supports 4 slot trigger conditions:
 - ◆ Triggered by software
 - ◆ Triggered by falling edge
 - ◆ Triggered by rising edge
 - ◆ Triggered by rising edge or falling edge
- Supports PSIO PIN for pin state control
 - Supports 8 check points to connect with slots in each pin
 - Supports 8 check point actions in each check point.
 - Supports 7 kinds of check point action to setting
 - ◆ Output high
 - ◆ Output low
 - ◆ Output data
 - ◆ Output toggle
 - ◆ Input data
 - ◆ Input status
 - ◆ Input status update
 - Supports 4 I/O modes, input, output, open-drain, and quasi
 - Supports switch I/O mode in different check points
- Supports 4 kinds of Interrupt trigger conditions
 - Two sets of configurable slot interrupt controllers
 - Mismatch interrupt when PSIO is enabled with PDMA

- Transfer Error interrupt
- Slot controller counting done interrupt
- Supports PDMA function

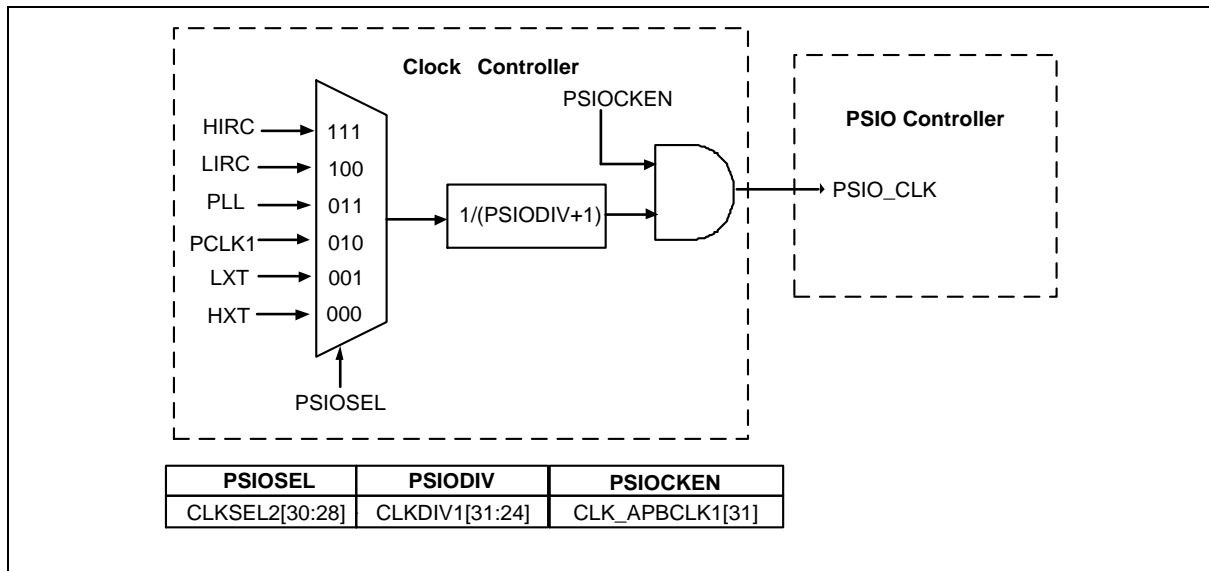

Figure 6.22-2 PSIO Clock Control Diagram (8-bit Pre-scale Counter in Clock Controller)

6.22.4 Basic Configuration

- Clock Source Configuration
 - Select the source of PSIO peripheral clock on PSIO SEL (CLK_CLKSEL2[30:28]).
 - Select the clock divider number of PSIO peripheral clock on PSIODIV(CLK_CLKDIV1[31:24]).
 - Enable PSIO peripheral clock in PSIOCKEN (CLK_APBCLK1[31]).
- Reset Configuration
 - Reset PSIO controller in PSIORST (SYS_IPRST2[31]).
- Pin Configuration

Table 6.22-1 PSIO MTFP Table

6.22.5 Data Rate Limitation

Due to only one PDMA channel for Tx and Rx independently, there is a data rate limitation for Tx and Rx in PDMA mode. The data rate is inversely proportional to the number of pins with PDMA enable. Table shows the fastest internal clock frequency and the maximum data rate with PDMA in the busy bus cases.

	1Pin	2Pin	3Pin	4Pin	5Pin	6Pin	7Pin	8Pin
Fastest Slot controller CLK Frequency	40.42 MHz	20.21 MHz	13.47 MHz	10.10 MHz	8.08 MHz	6.73 MHz	5.77 MHz	5.05 MHz
Data rate (bit/s)	40.42 Mbps	20.21 Mbps	13.47 Mbps	10.10 Mbps	8.08 Mbps	6.73 Mbps	5.77 Mbps	5.04 Mbps
Data rate (byte/s)	5.05 Mbps	2.52 Mbps	1.68 Mbps	1.26 Mbps	1.01 Mbps	0.84 Mbps	0.72 Mbps	0.63 Mbps

Table 6.22-2 PSIO Output Data Rate when Bus Traffic is Heavy

Note: Assuming it takes 18 cycles to read a data from SRAM and write it to peripheral or read it from

peripheral and write it to SRAM,(Consider PDMA takes 2 cycles to access SRAM, 13 cycles for PDMA transfer data, and 3 cycles for PDMA access PSIO) and 2 cycles for PSIO sync flag. Assuming that when PSIO sends a request to the PDMA, the PDMA is just starting to execute another request. So it would take $18 \times 2 + 2 = 38$ cycles per data. The CPU clock frequency is 48 MHz, and 1 cycle period is 20.48 ns. And the buffer data size is 32 bit.

$$Data\ Rates = \frac{PSIO\ Buffer\ Data\ size\ (bits)}{PSIO\ pin\ numbers \times PDMA\ channels \times CPU\ Cycles\ of\ transfer\ data(ns)}$$

When pin numbers = 1, and the data size is 32 bit,

$$Data\ Rates = \frac{32(bits)}{1 \times 1 \times 38\ Cycles(ns)} = \frac{32(bits)}{38 \times 20.83(ns)} = 40.42 \left(\frac{Mbits}{sec}\right) = 5.05 \left(\frac{Mbytes}{sec}\right)$$

the fastest slot controller clock frequency is 40.42 MHz

When pin numbers = 2, and the data size is 32 bit,

$$Data\ Rates = \frac{32(bits)}{2 \times 1 \times 38\ Cycles(ns)} = \frac{32(bits)}{2 \times 38 \times 20.83(ns)} = 20.21 \left(\frac{Mbits}{sec}\right) = 2.52 \left(\frac{Mbytes}{sec}\right)$$

the fastest slot controller clock frequency is 20.21 MHz

Assuming it takes 16 cycles to read a data from SRAM and write it to peripheral or read it from peripheral and write it to SRAM.(Consider PDMA takes 1 cycles to access SRAM, 13 cycles for PDMA transfer data, and 2 cycles for PDMA access PSIO) and 2 cycles for PSIO sync flag. Assuming that when PSIO sends a request to the PDMA, the PDMA is free. So it would take $16 + 2 = 18$ cycles per data. Table shows the fastest internal clock frequency and the maximum date rate with PDMA in the best bus cases. Transfer data size is 32-bit and the CPU clock frequency is 48 MHz.

	1Pin	2Pin	3Pin	4Pin	5Pin	6Pin	7Pin	8Pin
Fastest slot controller CLK frequency	48 Mhz	42.66 MHz	28.44 MHz	21.33 MHz	17.06 MHz	14.22 MHz	12.19 MHz	10.66 MHz
Data rate (bit/s)	48 Mbps	42.66 Mbps	28.44 Mbps	21.33 Mbps	17.06 Mbps	14.22 Mbps	12.19 Mbps	10.66 Mbps
Data rate (byte/s)	6 Mbps	5.33 Mbps	3.55 Mbps	2.66 Mbps	2.13 Mbps	1.77 Mbps	1.52 Mbps	1.33 Mbps

Table 6.22-3 PSIO Output Data Rate With Bus Is Free

When pin numbers = 2, and the data size is 32 bit,

$$Data\ Rates = \frac{32(bits)}{2 \times 1 \times 18\ Cycles(ns)} = \frac{32(bits)}{18 \times 20.83(ns)} = 42.66 \left(\frac{Mbits}{sec}\right) = 5.33 \left(\frac{Mbytes}{sec}\right)$$

the fastest slot controller clock frequency is 42.66 MHz

When pin numbers = 8, and the data size is 32 bit,

$$Data\ Rates = \frac{32(bits)}{8 \times 1 \times 18\ Cycles(ns)} = \frac{32(bits)}{8 \times 18 \times 20.83(ns)} = 10.66 \left(\frac{Mbits}{sec}\right) = 1.33 \left(\frac{Mbytes}{sec}\right)$$

the fastest slot controller clock frequency is 10.66 MHz

For the fastest input data rate, consider the PDMA will read the PSIO then update it to SRAM. The last pin that PDMA read will only takes 8 cycles to finish the whole data transfer. So when we calculated the fastest input data frequency, the total cycles that PDMA need to read data from PSIO can subtract 8 cycles. Note that the fastest input data rate does not represent the sample rate that the PSIO can sample in input pin.

	1Pin	2Pin	3Pin	4Pin	5Pin	6Pin	7Pin	8Pin
Fastest slot controller CLK frequency	48 Mhz	48 MHz	33.39 MHz	24 MHz	18.73 MHz	15.36 MHz	13.01 MHz	11.29 MHz
Data rate (bit/s)	48 Mbps	48 Mbps	33.39 Mbps	24 Mbps	18.73 Mbps	15.36 Mbps	13.01 Mbps	11.29 Mbps
Data rate (byte/s)	6 Mbps	6 Mbps	4.17 Mbps	3 Mbps	2.34 Mbps	1.92 Mbps	1.62 Mbps	1.41 Mbps

Table 6.22-4 PSIO Input Data Rate With Bus Is Free

When pin numbers = 3, and the data size is 32 bit,

$$Data\ Rates = \frac{32(bits)}{(3 \times 18 - 8) Cycles(ns)} = \frac{32(bits)}{(46) \times 20.83(ns)} = 33.39 \left(\frac{Mbits}{sec} \right) = 4.17 \left(\frac{Mbytes}{sec} \right)$$

the fastest slot controller clock frequency is 42.66 MHz

When pin numbers = 8, and the data size is 32 bit,

$$Data\ Rates = \frac{32(bits)}{(8 \times 18 - 8) Cycles(ns)} = \frac{32(bits)}{(136) \times 20.83(ns)} = 11.29 \left(\frac{Mbits}{sec} \right) = 1.41 \left(\frac{Mbytes}{sec} \right)$$

the fastest slot controller clock frequency is 11.29 MHz

6.22.6 Functional Description

There are a total of 4 slot controllers and 8 pins in PSIO. Each pin can choose one of the 4 slot controllers as the counting source. The slot controller has 8 slots. Each Slot can set counting cycles from 0 to 15. There have slot period repeat mode, which can choose some slot repeat counting. There also have I/O mode switch point, which can change I/O mode type at the selected check point.

The PSIO provides data transfer with PDMA, it can support up to 8 pins transfer data.

6.22.6.1 Basic Operation

Each slot can set counting cycles in PSIO_SCnSLOT. After filling the slot controller slot in PSIO_SCnSLOT, trigger source of slot controller is set from TRIGSRC(PSIO_SCnCTL[15:14]). There are four kind of trigger source, software trigger, START(PSIO_SCnCTL[16]), falling edge trigger from related input PIN, rising edge trigger from related input PIN, and rising edge or falling edge trigger from related input PIN.

Each PSIO pin can be linked to one of the slot controllers by SCSEL(PSIOOn_GENCTL[25:24]). The pin can link the check point to the slot of related slot controller by setting CKPT0(PSIOOn_CPCTL0[3:0]) to CKPT7 (PSIOOn_CPCTL0[31:28]). After the slot controller start counting, pin will do the corresponding check point action filled in PSIOOn_CPCTL1 when the slot of the slot controller is the same as the pin's check point.

When the slot controller finishes all setting slots, BUSY(PSIO_SCnCTL[24]) will be cleared to 0, and the BUSY flag will be cleared to 0 ,too.

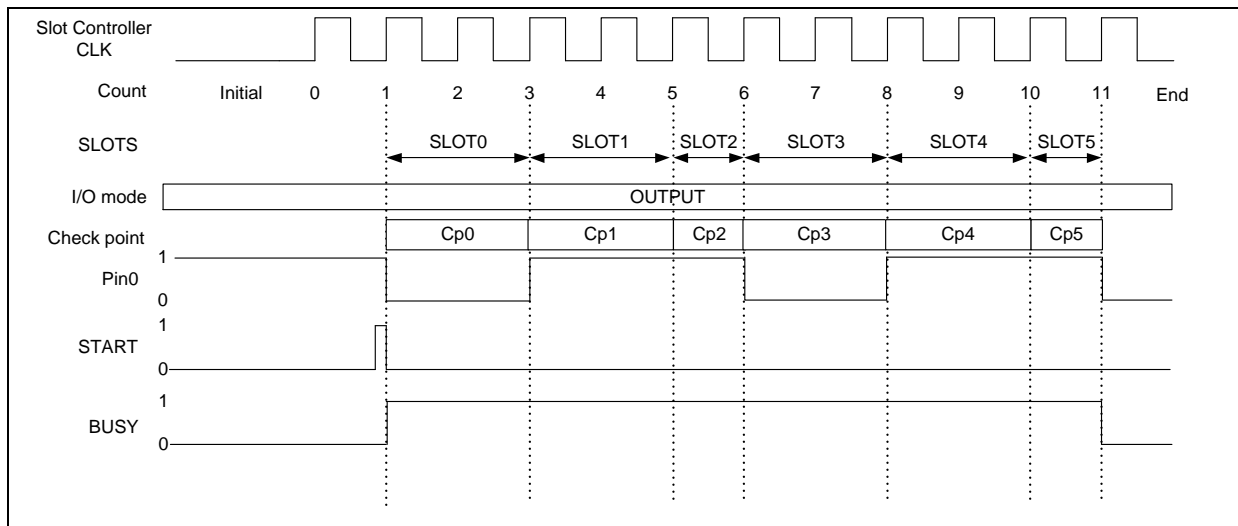

Figure 6.22-3 Basic Operation

6.22.6.2 Slot Controller Trigger Condition

There are two ways to trigger Slot Controller. First way to trigger slot controller is by programming 1 to START (PSIO_SCnCTL[16]), then the slot controller will be trigger immediately. If the slot controller also enable the PDMA function to transfer data from memory space to the PSIO pin which is intend to output data, then the slot controller will not start counting until the output data is ready.

The second way to trigger slot controller is by external pin edge detection. PSIO provides three kinds of edge trigger , they are falling edge trigger, rising edge trigger and both edge trigger. When the pin rises or fall, it must keep it pin state at least 2 PSIO_CLK or the edge variation will not be detect.

If the slot controller is triggered and the related pin action is output data, but there is no output data in output data buffer, then the output data underflow flag will be set.

6.22.6.3 Slot Controller Repeat Mode

There are three kinds of repeat mode for slot controller in PSIO. The first kind is partial repeat mode with finite loops. Initial repeat slot (INISLOT, PSIO_SCnCTL[3:0]) and end repeat slot (ENDSLOT, PSIO_SCnCTL[7:4]) decide which slots to repeat. Slot period loop count (SPLCNT, PSIO_SCnCTL[13:8]) decides how many times slots should be repeated.

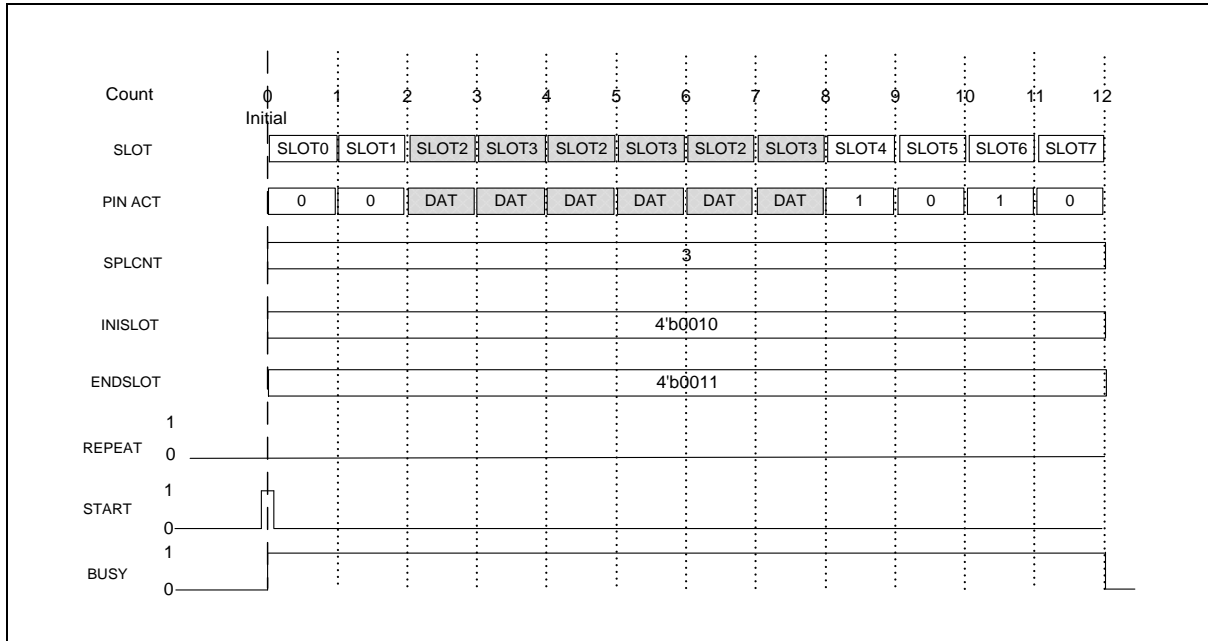

Figure 6.22-4 Slot Controller Normal Repeat Mode

The second kind is normal repeat mode with infinite loops. Filling 6'b111111 to SPLCNT(PSIO_SCnCTL[13:8]) will set slot controller enter partial repeat mode with infinite loops. In partial repeat mode with infinite loops, the slot controller will repeat counting until output data buffer is underflow or input data buffer is overflow or configuring 0 to START(PSIO_SCnCTL[16]), then the slot controller will stop at the end repeat slot when it receives stop signal.

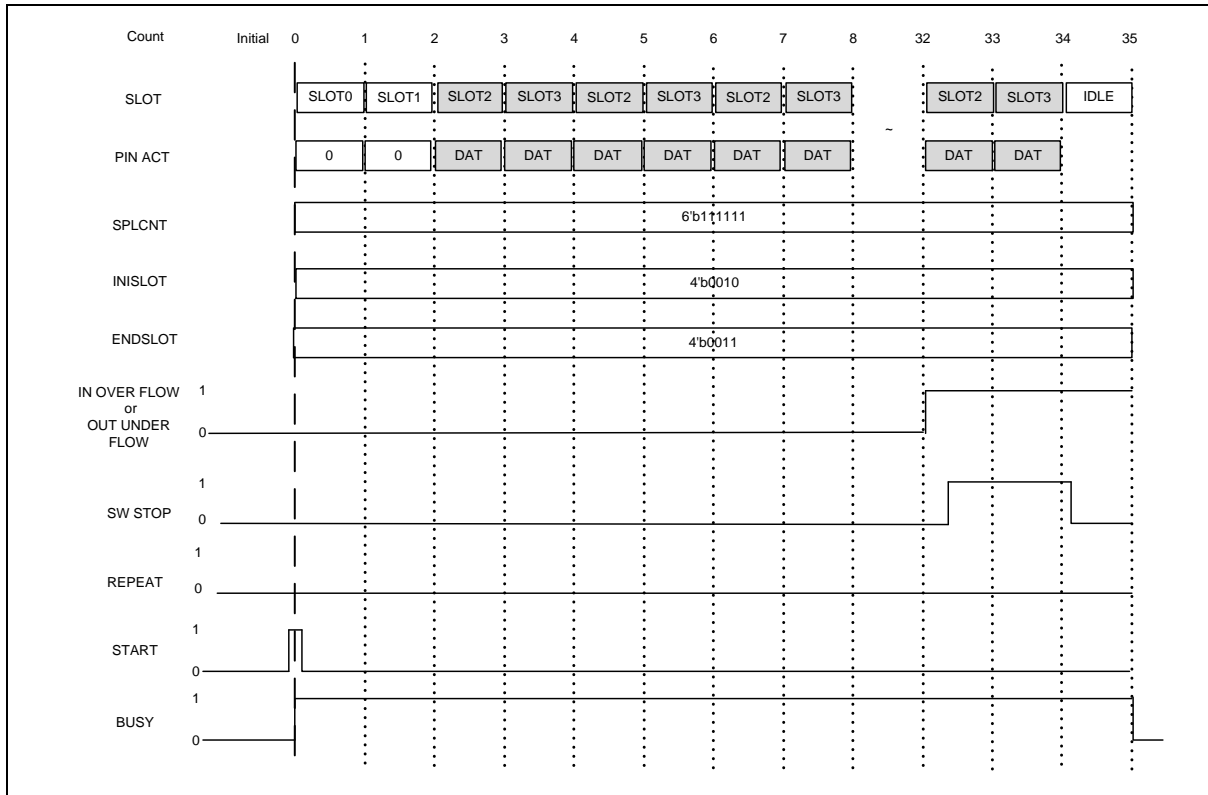

Figure 6.22-5 Slot Controller Normal Repeat Mode with Infinite Loops

The third kind of setting repeat mode with infinite loops is whole slots repeat mode. Configuring 1 to Repeat bit (PSIO_SCnCTL[17]) enables the whole repeat endless mode. In this mode, the enabled slot controller counts the slots enabled in PSIO_SCnSLOT in infinite loop. Only when the output data buffer is underflow or input data buffer is overflow or configuring 0 to START(PSIO_SCnCTL[16]), then the slot controller will stop at the last enable slot when it receives stop signal.

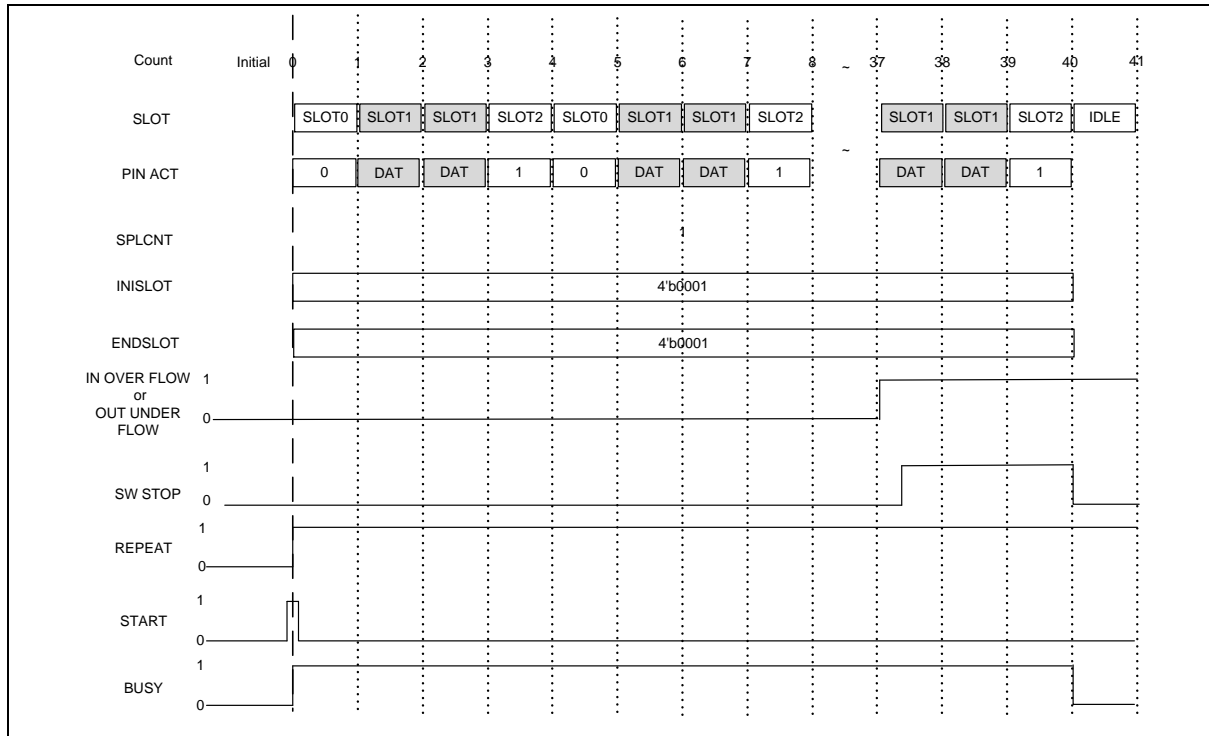

Figure 6.22-6 Slot Controller Repeat Mode with Whole Repeat Mode

If the pin enables input data and output data in the same loop with switch point function, the slot controller is set in repeat mode with finite loops, the conditions of stop counting is the output data underflow or input data overflow occurs.

6.22.6.4 Pin Initial State, Interval State and IDLE Flag

There are two control bits that determine the pin state is Initial or interval. The pin uses initial or interval as default setting depending on the IDLE(PSIO_SCNCTL[25]) and the slot controller has started or not. Before the slot controller starts counting, the pin state is determined by the initial bit. After the slot controller finishes counting and the IDLE(PSIO_SCNCTL[25]) is 0, the pin state is determined by the interval bit. As long as the slot controller starts counting, the IDLE(PSIO_SCNCTL[25]) will be cleared to 0 automatically. Only when software writes 1 to set IDLE(PSIO_SCNCTL[25]) to 1, the IDLE(PSIO_SCNCTL[25]) will be set to 1 or it will always keep 0.

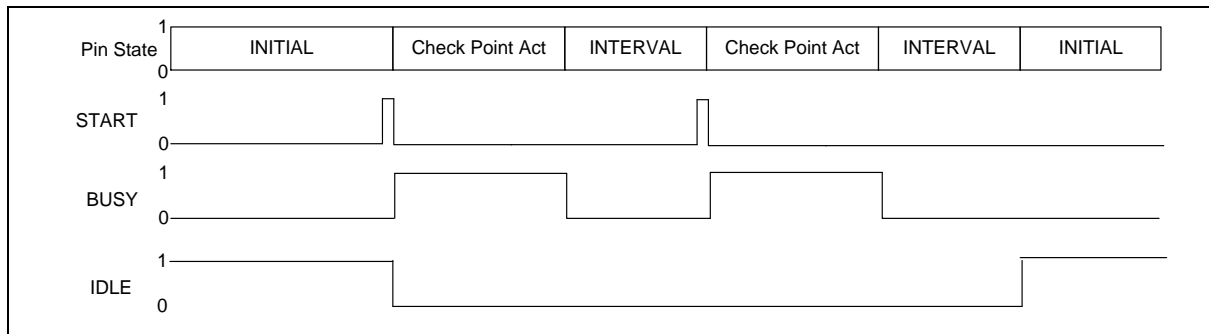

Figure 6.22-7 Initial State, Interval State And IDLE Flag

6.22.6.5 Pin Switch I/O State during Counting

In Slot action, user can use switch point function to change the I/O state at different slot. PSIO supports at most switching I/O operation mode twice in a loop. User can configure MODESW1, MODESW0,

SW0CP, and SW1CP in PSIO_n_GENCTL.

There is a hardware limitation for mode switch from output to input. We need to consider the pad delay and the device response time to choose the slot length of input check point which can affect the time PSIO sample the device responds. The input delay from input pin to input data buffer is 4 PSIO_CLK. The PADOUT delay represents the delay from PSIO to chip pin. The device response time represents the time that device responds the PSIO. The PADIN delay represents the delay from chip pin to PSIO. For PSIO switch the I/O mode at check point 2, and the device respond is transfer before count 4. PSIO input data buffer will sample it at count 8. Due to the input data sample delay and PADOUT DELAY, PADIN DELAY, device response time, the shortest slot length of check point 2 is 8 for the switch I/O mode in input mode to sample the device responds.

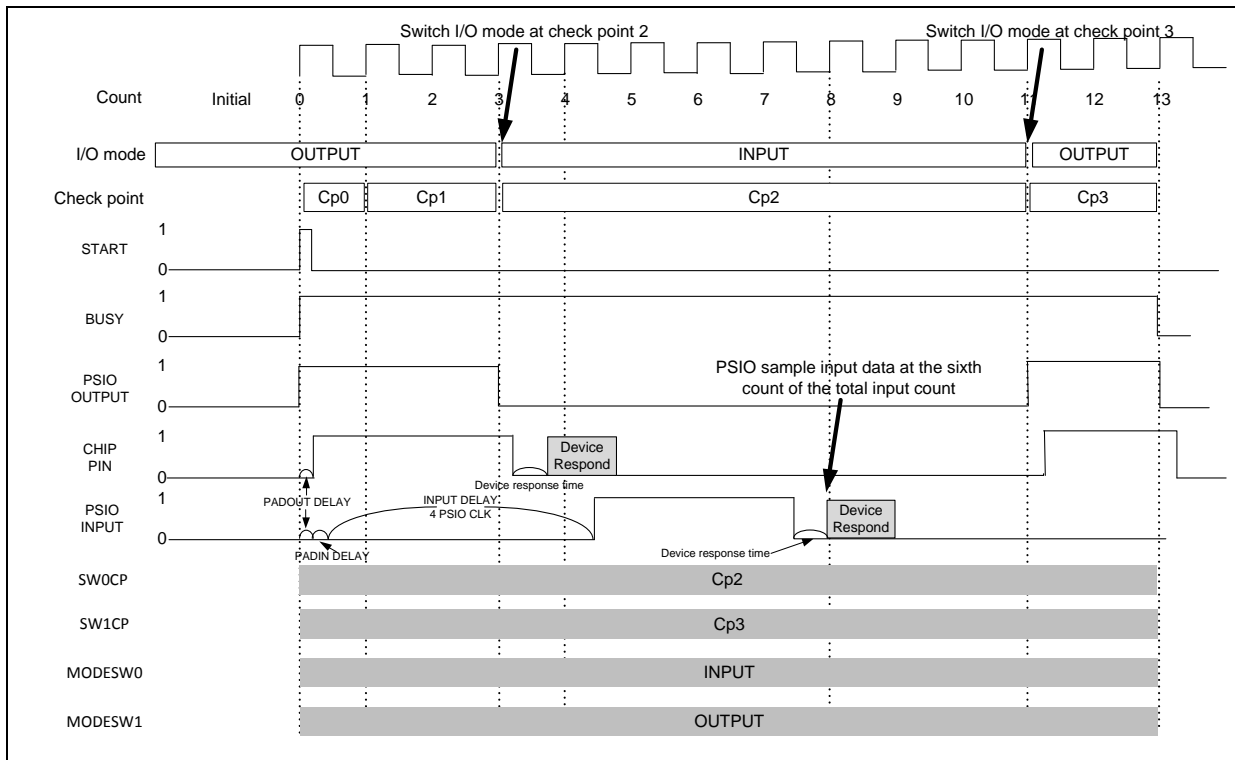

Figure 6.22-8 Switch I/O Mode

The relationship between PSIO, PADOUT DELAY, PADIN DELAY, Device response time and Device is shown in Figure 6.22-9.

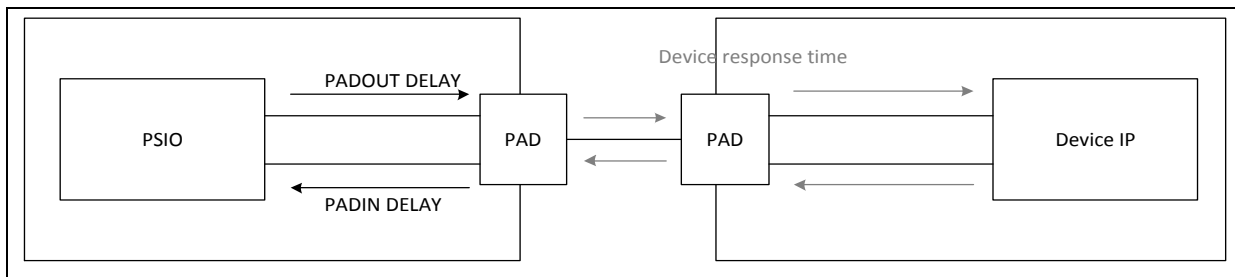

Figure 6.22-9 PAD Delay Time and Device Response Time

The PADOUT DELAY and PADIN DELAY may vary from different chip model for the routing. The PADOUT DELAY and PADIN DELAY value is shown in Table 6.22-5.

	PADOUT DELAY	PADIN DELAY
M251/M252	20 nS	10 nS

Table 6.22-5 PADOUT DELAY and PADIN DELAY

6.22.6.6 Input/Output Data Buffer

Each PSIO_PIN has its own 32-bit input data buffer and output data buffer to let the buffer operation be more efficient. The 32-bit data buffer can be sliced into shorter buffer when data width is shorter than 16-bit by setting OUTDEPTH(PSION_DATCTL[25:24]) and INDEPTH(PSION_DATCTL[29:28]).

When the OUTDATWD (PSION_DATCTL[4:0]) and INDATWD (PSION_DATCTL[12:9]) are larger than 16-bit, the setting of OUTDEPTH(PSION_DATCTL[25:24]) and INDEPTH(PSION_DATCTL[29:28]) will be ignored. The PSIO_PIN will have one 32-bit data buffer.

Figure 6.22-10 Data Width Larger Than 16-bit

When the OUTDATWD (PSION_DATCTL[4:0]) and INDATWD (PSION_DATCTL[12:9]) is between 8-bit to 16-bit, the 32-bit data buffer can be sliced into two 16-bit buffer by setting OUTDEPTH[0](PSION_DATCTL[24]) and INDEPTH[0](PSION_DATCTL[28]).

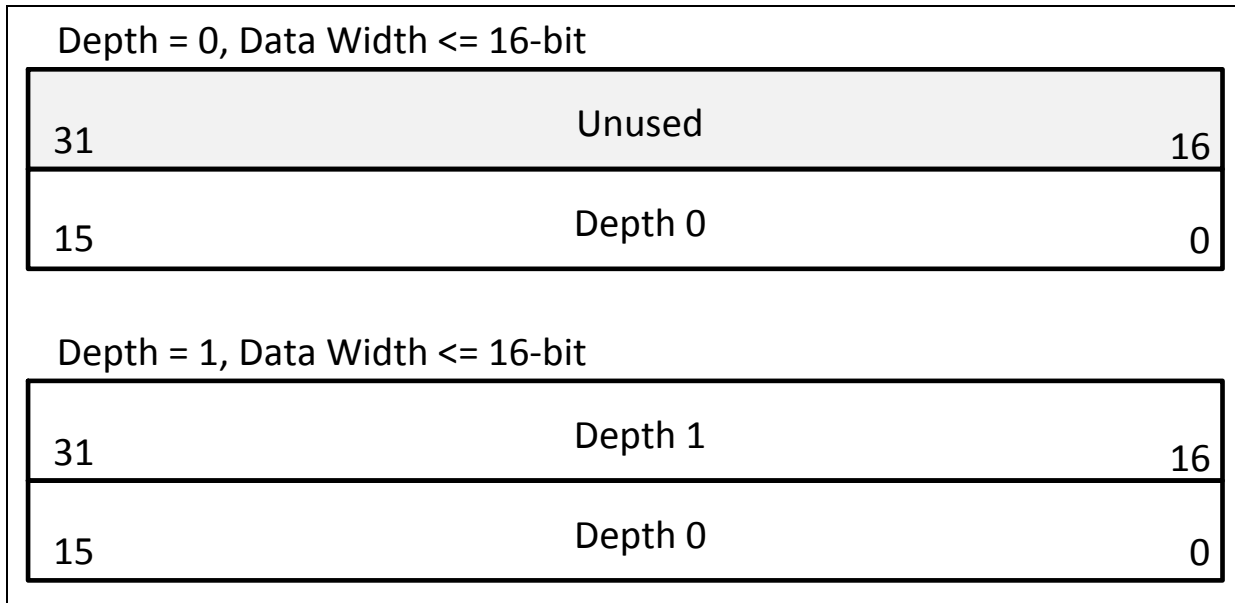

Figure 6.22-11 Data Width Between 16-bit and 8-bit

When the OUTDATWD (PSION_DATCTL[4:0]) and INDATWD (PSION_DATCTL[12:9]) is between 1-bit to 8-bit, the 32-bit data buffer can be sliced into four 8-bit buffer by setting OUTDEPTH[1:0](PSION_DATCTL[25:24]) and INDEPTH[1:0](PSION_DATCTL[29:28]).

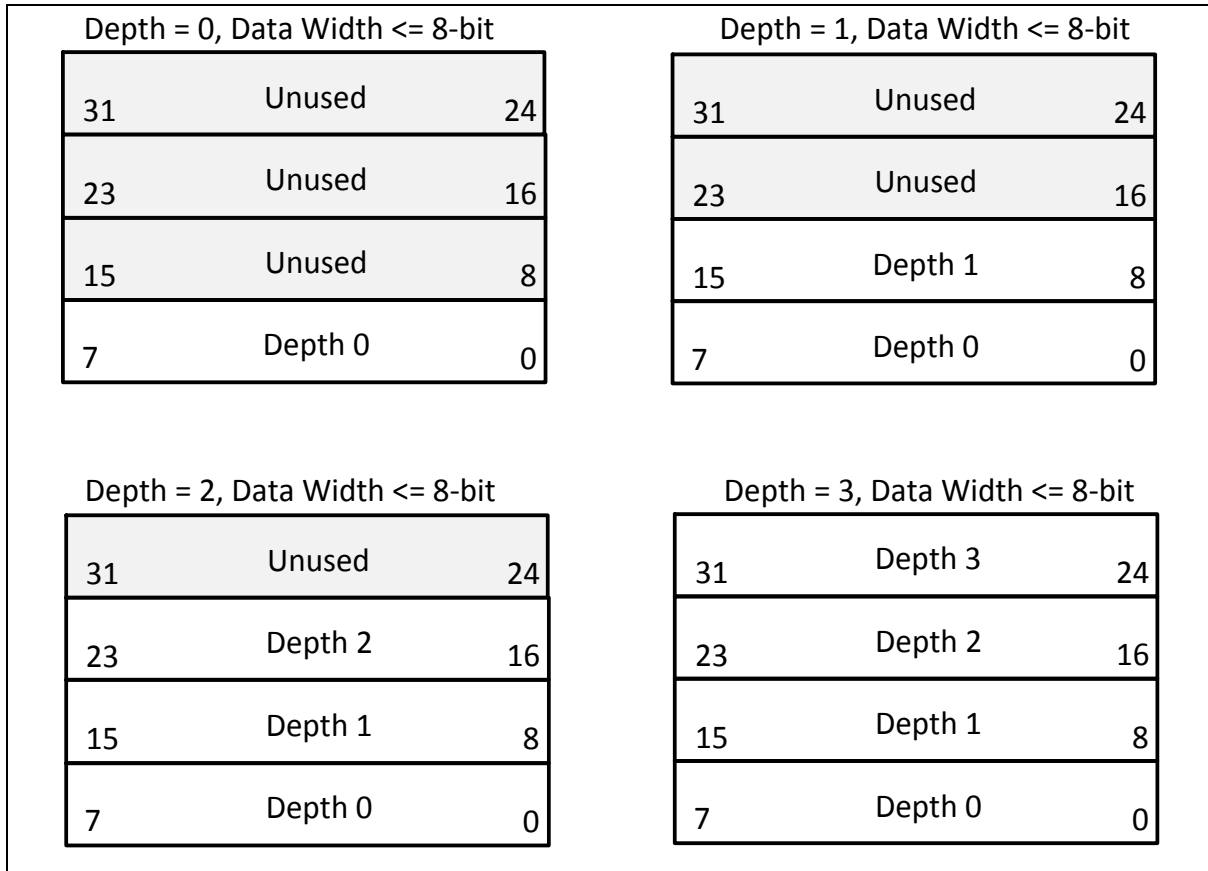

Figure 6.22-12 Data Width Smaller Than 8-bit

When PSIO outputs data, the relation of output data buffer and the empty flag is shown in Figure 6.22-13.

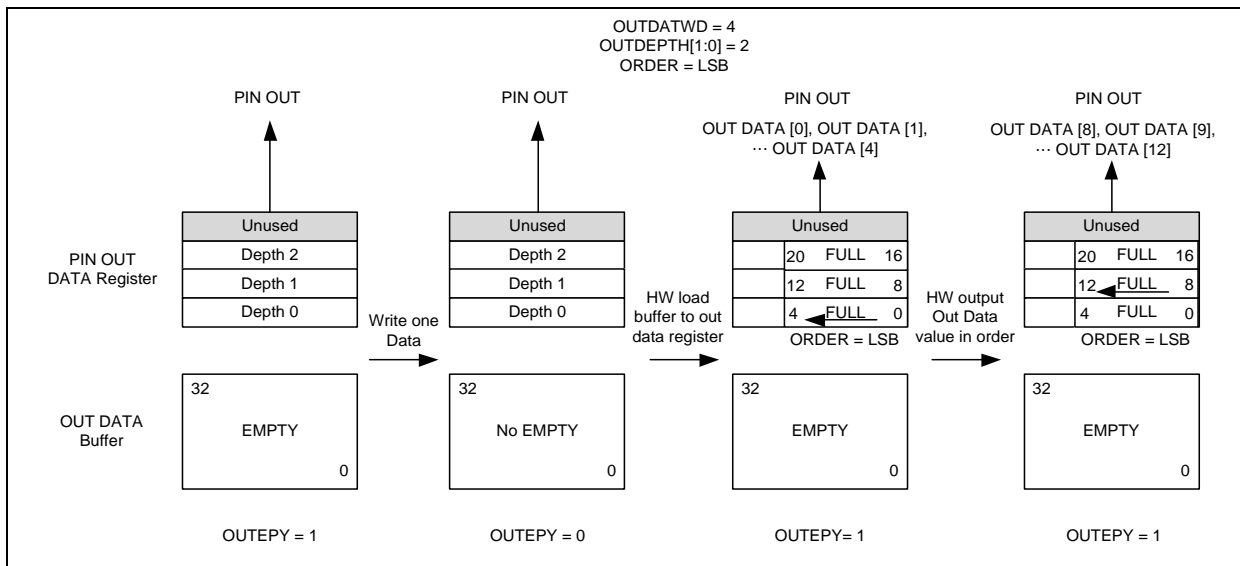

Figure 6.22-13 OUTPUT DATA Buffer Example

When PSIO inputs data, the relation of input data buffer and the full flag is shown in Figure 6.22-14.

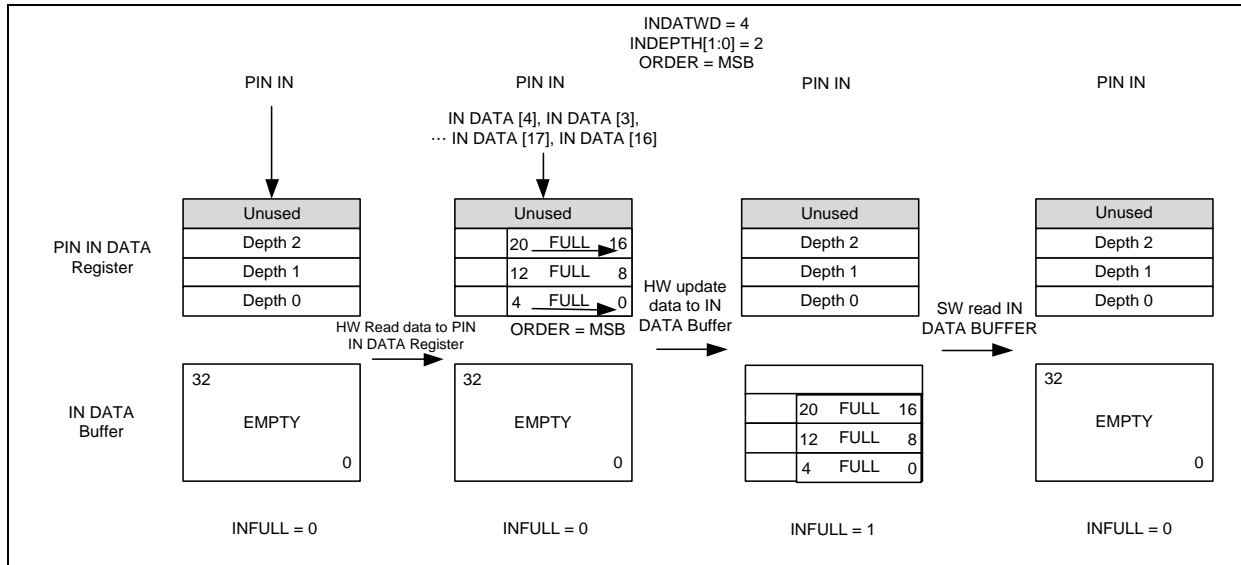

Figure 6.22-14 INPUT DATA Buffer Example

When output data underflow occurs, PSIO will output the data from the start address of output data buffer again.

After the input data overflow occurs, the pin state will not be record in the input data buffer and the current input data buffer will be keep.

6.22.6.7 Interrupt Trigger Condition

There are four kinds of interrupts in PSIO. The first kind of interrupts is configurable interrupt. User can set interrupt will be trigger at which slot end, and this interrupt trigger is also affected by repeat mode.

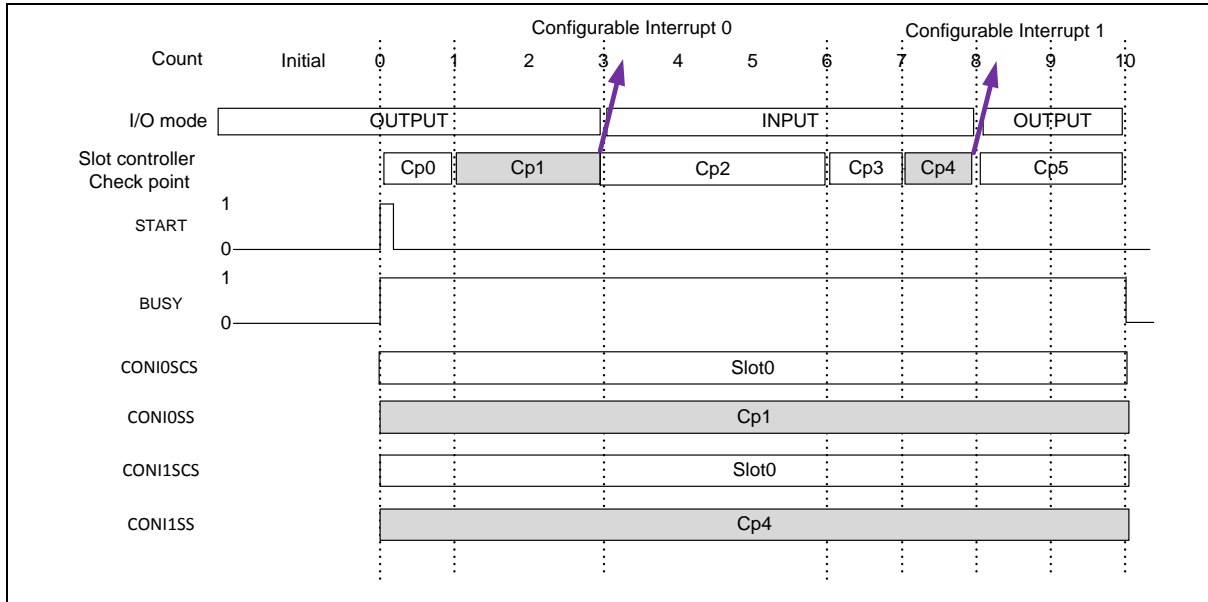

Figure 6.22-15 Configurable Interrupt Flag

The second kind of interrupts is mismatch (MISMATCH), it will be trigger only when using multiple pins transfer data with PDMA, but the date transfer rate between the slots are not consistent.

The third kind of interrupts is transfer error (TERRIF), it will be trigger when there is a transfer error like input data overflow (INOVERx) or output data underflow (OUTUFx)

The forth kind of interrupts is Slot Controller Counting Done(SCxIF), it will be trigger only when the slot controller stop counting.

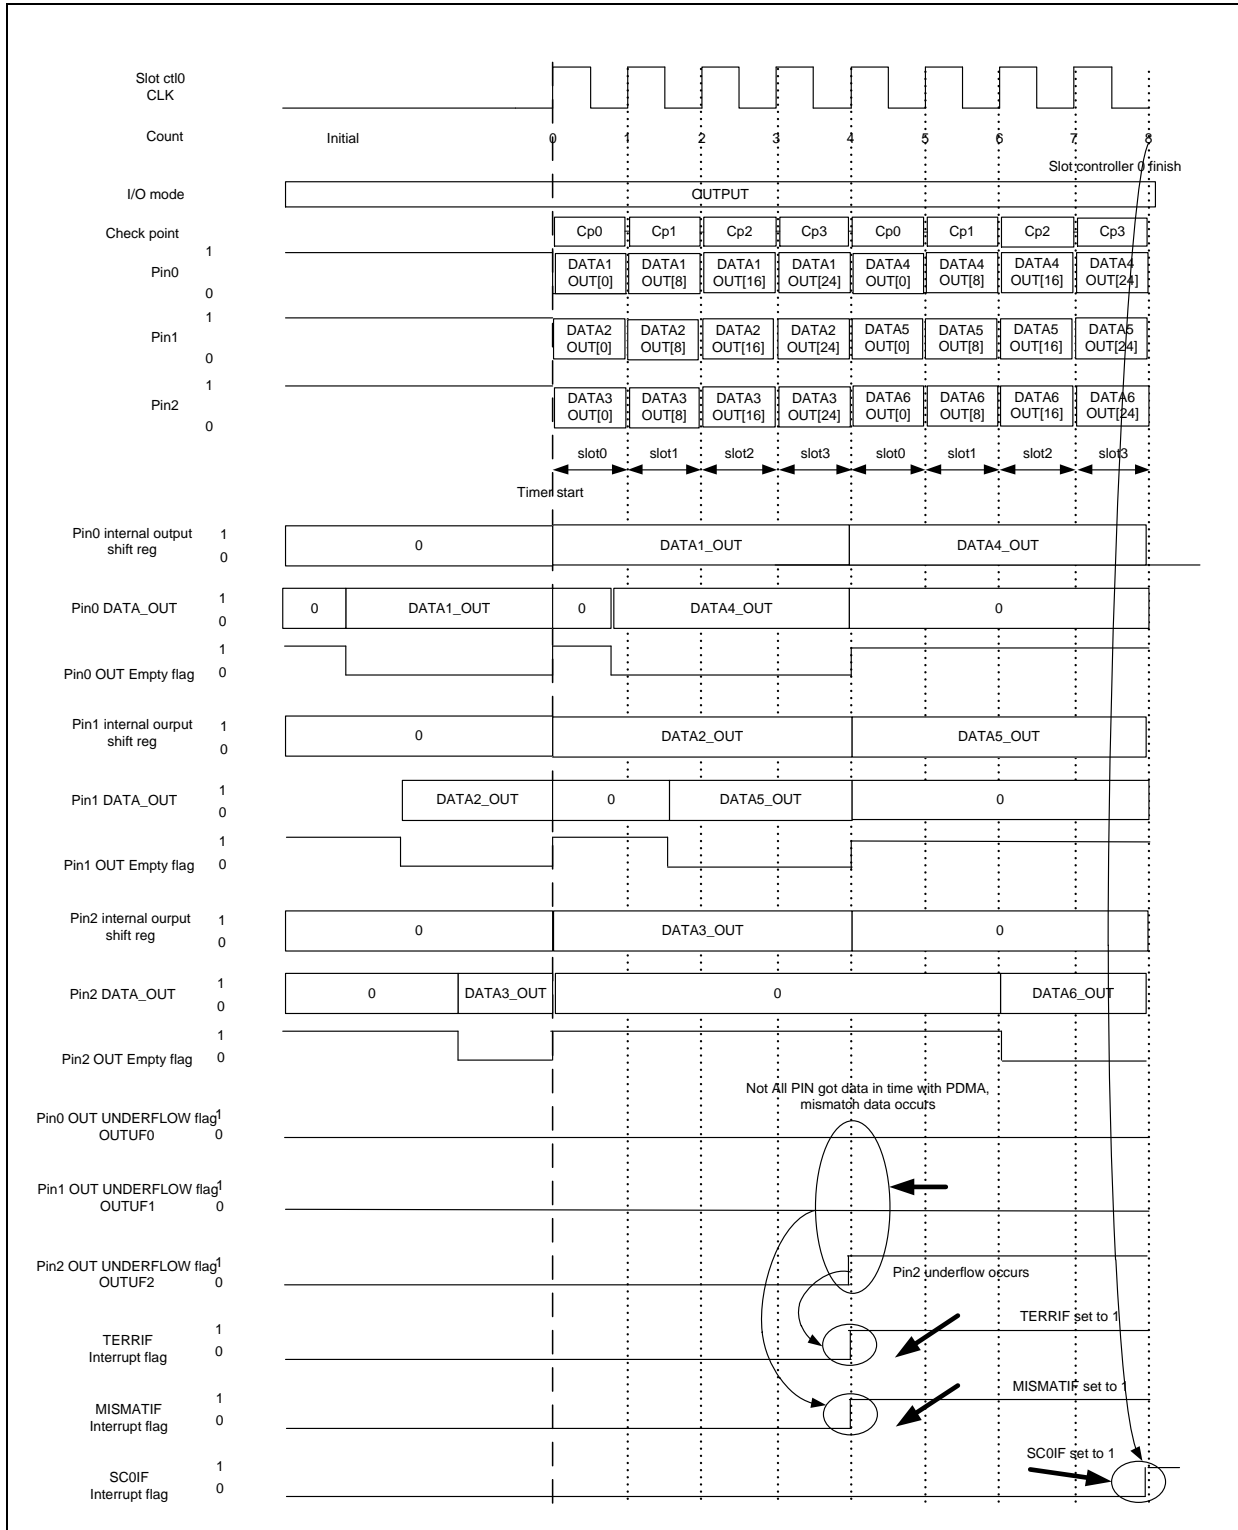

Figure 6.22-16 MISMATIF ,TERRIF and SCnIF

6.22.6.8 Data Transfer with PDMA

User can use PDMA to increase data transfer rate. Due to the PDMA cannot transfer data to the buffer

address roundly, PSIO provide a fixed address, PSIO_PODAT and PSIO_PIDAT, for PDMA to transfer data to data buffer of different pin roundly. After PDMA transfers data to PSIO_PODAT or get data from PSIO_PIDAT, PSIO will move PSIO_PODAT to the coordinate PSIOn_OUTDAT or move the coordinate PSIOn_INDAT to PSIO_PIDAT. The order of PSIO move PSIO_PODAT to the coordinate PSIOn_OUTDAT or move the coordinate PSIOn_INDAT to PSIO_PIDAT is ascending from pin0 to pin7.

When PSIO pin is in PDMA OUTPUT mode, all the enable slots in slot controller of PDMA output mode must link to the related check points in the enable pins of PDMA output mode, or the pin may stop at unexpected slot.

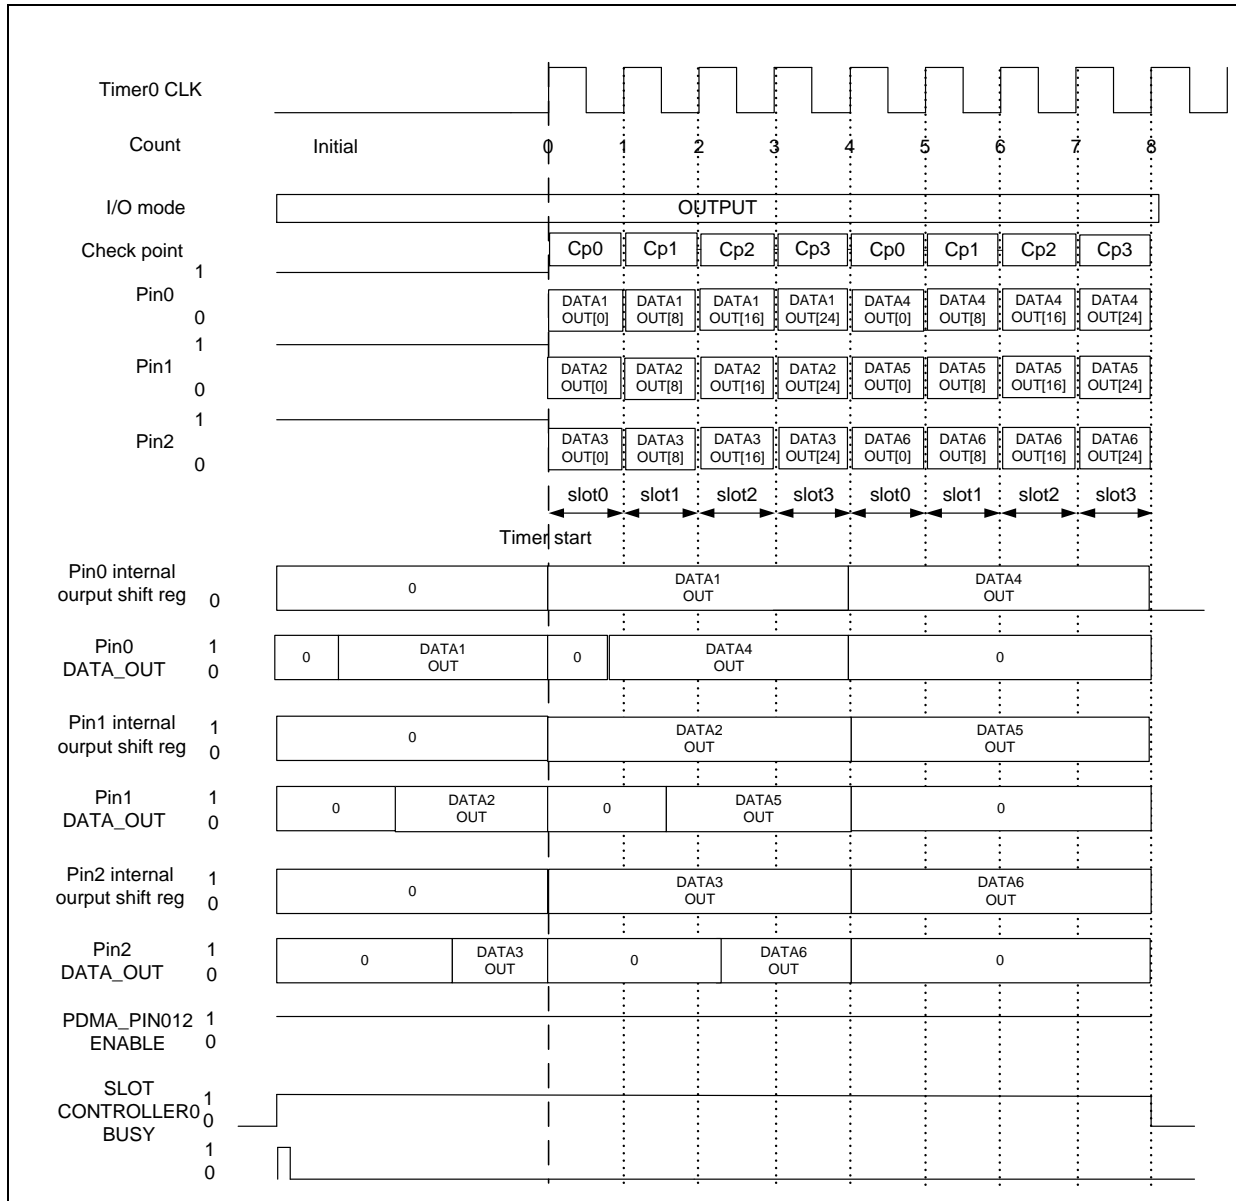

Figure 6.22-17 Data Transfer with PDMA

6.22.7 Programing Flow

6.22.7.1 Normal Programing

1. Set count of slot controller slot, repeat mask, and repeat loop count in PSIO_SCnSLOT and PSIO_SCnCTL
2. Set I/O switch point, I/O initial mode, initial output, interval output, and corresponding slot controller in PSIOn_GENCTL.
3. Set the transmit data in PSIOn_OUTDAT, order, data width and data depth in PSIOn_DATCTL.
4. Set check point and check point act in PSIOn_CPCTL0 and PSIOn_CPCTL1
5. Set interrupt trigger point at which pin and check point in PSIO_INTCTL
6. Set slot controller start counting condition at PSIO_SCnCTL, and BUSY(PSIO_SCnCTL) flag will be set to 1 automatically
7. When slot controller stop counting, BUSY(PSIO_SCnCTL) flag will be cleared to 0 automatically.
8. Check PSIOn_INDAT and PSIOn_INTSTS if there is input data.

6.22.7.2 Normal Programing Example

1. Set slot0 to slot5 of slot controller 0 to determine the slot length
 - 1) Set the slot 0 length as 1 in SLOT0(PSIO_SC0SLOT[3:0] = 0x1).
 - 2) Set the slot 1 length as 2 in SLOT1(PSIO_SC0SLOT[7:4] = 0x2).
 - 3) Set the slot 2 length as 3 in SLOT2(PSIO_SC0SLOT[11:8] = 0x3).
 - 4) Set the slot 3 length as 1 in SLOT3(PSIO_SC0SLOT[15:12] = 0x1).
 - 5) Set the slot 4 length as 2 in SLOT4(PSIO_SC0SLOT[19:16] = 0x2).
 - 6) Set the slot 5 length as 1 in SLOT5(PSIO_SC0SLOT[23:20] = 0x1).
2. Set slot repeat function to determine the slot repeat period.
 - 1) Set repeat times as 1 in SPLCNT(PSIO_SC0CTL[13:8] = 0x1, Slot Period Loop Count).
 - 2) Set the initial repeat slot as SLOT3 in INISLOT(PSIO_SC0CTL[3:0] = 0x4, Initial Slot Period).
 - 3) Set the end repeat slot as SLOT4 in ENDSLOT(PSIO_SC0CTL[7:4] = 0x5, End Slot Period).
3. Set PIN0 general control register(PSIO0_GENCTL).
 - 1) Set the initial pin state as high in INITIAL(PSIO0_GENCTL[3:2] = 0x1).
 - 2) Set the interval pin state low in INTERVAL(PSIO0_GENCTL[5:4] = 0x0).
 - 3) Set the I/O mode will switch at CHECK POINT 1 in SW0CP(PSIO0_GENCTL[11:8] = 0x2).
 - 4) Set the I/O mode will switch at CHECK POINT 2 in SW1CP(PSIO0_GENCTL[15:12] = 0x3).
 - 5) Set the I/O mode will switch to INPUT mode at CHECK POINT 1 in MODESW0(PSIO0_GENCTL[17:16] = 0x0).
 - 6) Set the I/O mode will switch to OUTPUT mode at CHECK POINT 2 in MODESW1(PSIO0_GENCTL[19:18] = 0x4).
 - 7) Set the initial I/O mode is OUTPUT mode in IOMODE(PSIO0_GENCTL[5:4] = 0x1).
4. Set PIN0 data controller (PSIO0_DATCTL) to determine the data property.

- 1) Set the data order is LSB in ORDER(PSIO0_DATCTL[16] = 0x0).
 - 2) Set the input data width is 8 bit in INDATWD(PSIO0_DATCTL[12:8] = 0x7).
 - 3) Set the input data depth is 4 in INDEPTH(PSIO0_DATCTL[29:28] = 0x3).
5. Set PIN0 check point controller 0 (PSIO0_CPCTL0) to determine which slot will be connect to the check point.
- 1) Connect the slot1 to check point0 by configuring 0x2(SLOT1) to CKPT0(PSIO0_CPCTL0[3:0]).
 - 2) Connect the slot2 to check point1 by configuring 0x3(SLOT2) to CKPT1(PSIO0_CPCTL0[7:4]).
 - 3) Connect the slot3 to check point2 by Configuring 0x4(SLOT3) to CKPT2(PSIO0_CPCTL0[11:8]).
6. Set PIN0 check point controller 1 (PSIO0_CP1CTL) to determine the check point action at the check points.
- 1) Set PIN0 output low at the check point0 by configuring 0x0(output low) to CKPT0ACT(PSIO0_CPCTL1[2:0]).
 - 2) Set PIN0 record pin state to input data at the check point1 by configuring 0x4(input data) to CKPT1ACT(PSIO0_CPCTL1[6:4]).
 - 3) Set PIN0 output high at the check point2 by configuring 0x1(output high) to CKPT2ACT(PSIO0_CPCTL1[10:8]).
7. Set PIN1 general control register(PSIO0_GENCTL).
- 1) Set the initial pin state as low in INITIAL(PSIO0_GENCTL[3:2] = 0x0).
 - 2) Set the interval pin state low in INTERVAL(PSIO0_GENCTL[5:4] = 0x0).
 - 3) Set the initial I/O mode is OUTPUT mode in IOMODE(PSIO0_GENCTL[5:4] = 0x1).
8. Set PIN1 data controller (PSIO0_DATCTL) to determine the data property.
- 1) Set the data order is MSB in ORDER(PSIO0_DATCTL[16] = 0x1).
 - 2) Set the input data width is 2 bit in INDATWD(PSIO0_DATCTL[12:8] = 0x1).
 - 3) Set the input data depth is 4 in INDEPTH(PSIO0_DATCTL[29:28] = 0x3).
9. Set PIN1 check point controller 0 (PSIO0_CPCTL0) to determine which slot will be link to the check point.
- 1) Connect the slot0 to check point0 by configuring 0x1(SLOT0) to CKPT0(PSIO0_CPCTL0[3:0]).
 - 2) Connect the slot2 to check point1 by configuring 0x3(SLOT2) to CKPT1(PSIO0_CPCTL0[7:4]).
 - 3) Connect the slot4 to check point2 by Configuring 0x5(SLOT4) to CKPT2(PSIO0_CPCTL0[11:8]).
10. Set PIN1 check point controller 1 (PSIO0_CP1CTL) to determine the check point action at the check points.
- 1) Set PIN1 output high at the check point0 by configuring 0x1(output high) to CKPT0ACT(PSIO0_CPCTL1[2:0]).
 - 2) Set PIN1 output data from output data buffer at the check point1 by configuring 0x2(output data) to CKPT1ACT(PSIO0_CPCTL1[6:4]).
 - 3) Set PIN1 output high at the check point2 by configuring 0x1(output high) to CKPT2ACT(PSIO0_CPCTL1[10:8]).

11. Set PSIO_INTCTL to determine when the configurable interrupt will be trigger.
 - 1) Select the slot controller 0 as the trigger slot controller of configurable interrupt by Set 0x0 (slot controller 0) to CONI0SCS (PSIO_INTCTL[9:8]).
 - 2) Set the configurable interrupt will be trigger after slot 3 of slot controller 0 by configuring 0x4 (slot 3) to CONI0SCS (PSIO_INTCTL[2:0]).
12. Set PSIO_SC0CTL to start the slot controller.
 - 1) Select the trigger source is software trigger by configuring 0 to TRIGSRC(PSIO_SC0CTL[15:14], SC0 Trigger Source).
 - 2) Enable slot controller 0 by set 1 to START(PSIO_SC0CTL[16], SC0 START).

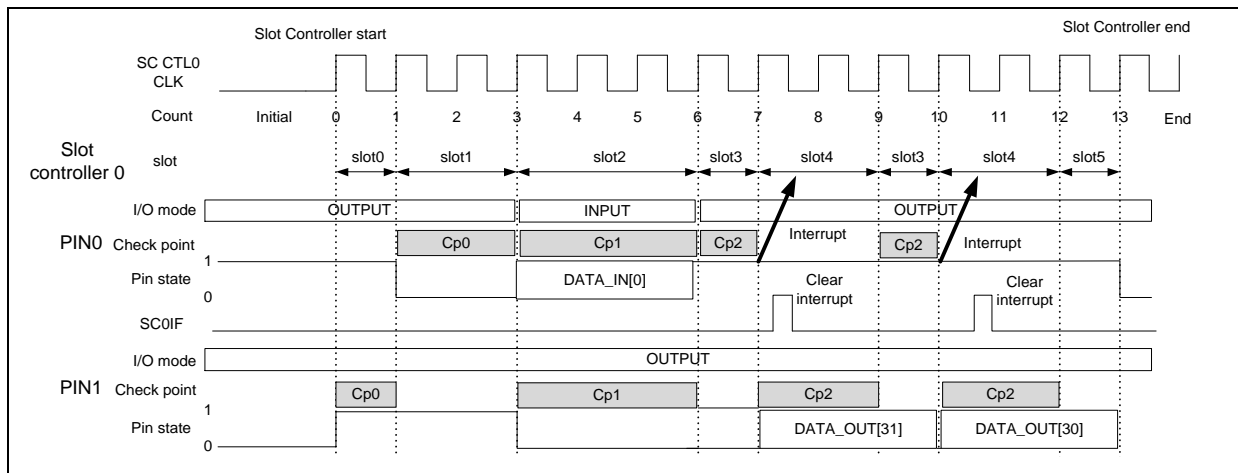

Figure 6.22-18 Normal Programming Example

6.22.7.3 Programming with PDMA Repeat Mode

1. Set which pins use PDMA to transfer data in PSIO_PDMACTL.
2. Set count of slot controller slot, repeat slots, and repeat loop count in PSIO_SCnSLOT and PSIO_SCnCTL.
3. Set I/O switch point, I/O initial mode, initial output, final output, and corresponding slot controller in PSIO_n_GENCTL.
4. Set the transmit data in PSIO_n_OUTDAT, order, data width and data depth in PSIO_n_DATCTL.
5. Set check point and check point act in PSIO_n_CPCTL0 and PSIO_n_CPCTL1
6. Set interrupt trigger point at which pin and check point in PSIO_INTCTL
7. Set slot controller start counting condition at PSIO_SCnCTL
8. When slot controller stop counting, BUSY(PSIO_SCnCTL) flag will be cleared to 0 automatically
9. Check PSIO_n_INTSTS if there is input status, and also can check the specified SRAM address data which are transferred by PDMA.

6.22.7.4 Programming Example 1 - PDMA with OUTPUT DATA and SLOT CONTROLLER REPEAT mode

1. Set slot0 to slot3 of slot controller 0 to determine the slot length
 - 1) Set 1 to SLOT0(PSIO_SC0SLOT[3:0])
 - 2) Set 2 to SLOT1(PSIO_SC0SLOT[7:4])
 - 3) Set 2 to SLOT2(PSIO_SC0SLOT[11:8])

- 4) Set 2 to SLOT3(PSIO_SC0SLOT[15:12])
2. Set slot repeat function to determine the slot repeat mode.
 - 1) Set 1 to REPEAT(PSIO_SC0CTL[17], Whole Repeat Mode) to determine the repeat mode.
3. Set PIN0 general control register(PSIO0_GENCTL).
 - 1) Set 1 to INITIAL(PSIO0_GENCTL[3:2]) to determine the initial pin state.
 - 2) Set 0 to INTERVAL(PSIO0_GENCTL[5:4]) to determine the interval pin state.
 - 3) Set 0x1 to IOMODE(PSIO0_GENCTL[5:4]) to determine the initial I/O mode is OUTPUT mode.
4. Set PIN0 data controller (PSIO0_DATCTL) to determine the data property.
 - 1) Set 0 to ORDER(PSIO0_DATCTL[16]) to determine the data order is LSB.
 - 2) Set 0x0 to OUTDATWD(PSIO0_DATCTL[4:0]) to determine the output data width is 1 bit.
 - 3) Set 0x3 to OUTDEPTH(PSIO0_DATCTL[25:24]) to determine the output data depth is 4.
5. Set PIN0 check point controller 0 (PSIO0_CPCTL0) to determine which slot will be link to the check point.
 - 1) Set 0x1(SLOT0) to CKPT0(PSIO0_CPCTL0[3:0]) to link the slot1 to check point0.
 - 2) Set 0x2(SLOT1) to CKPT1(PSIO0_CPCTL0[7:4]) to link the slot2 to check point1.
 - 3) Set 0x3(SLOT2) to CKPT2(PSIO0_CPCTL0[11:8]) to link the slot3 to check point2.
 - 4) Set 0x4(SLOT3) to CKPT3(PSIO0_CPCTL0[15:12]) to link the slot4 to check point3.
6. Set PIN0 check point controller 1 (PSIO0_CP1CTL) to determine the check point action at the check points.
 - 1) Set 0x0(output 0) to CKPT0ACT(PSIO0_CPCTL1[2:0]) to output 0 at the check point 0.
 - 2) Set 0x2(output data) to CKPT1ACT(PSIO0_CPCTL1[6:4]) to output data at the check point1.
 - 3) Set 0x2(output data) to CKPT2ACT(PSIO0_CPCTL1[10:8]) to output data at the check point2.
 - 4) Set 0x2(output data) to CKPT3ACT(PSIO0_CPCTL1[14:12]) to output data at the check point3.
7. Set PSIO_INTCTL to determine when the configurable interrupt will be trigger.
 - 1) Set 0x0 (slot controller 0) to CONI0SCS (PSIO_INTCTL[9:8]) to select the slot controller 0.
 - 2) Set 0x4 (slot 3) to CONI0SCS (PSIO_INTCTL[2:0]) to let the configurable interrupt will be trigger after slot 3 of slot controller 0.
8. Set PDMA related setting to output data from sram to PSIO
 - 1) Set 0x20000000 to PDMA_DSCTn_SA as source address.
 - 2) Set PSIO_PODAT address (PSIO_BA + 0x18) to PDMA_DSCTn_DA as detination address.
 - 3) Set TXCNT(PDMA_DSCTn_CTL[31:16]) = 2 to set PDMA transfer data to PSIO 3 times
 - 4) Set 0x10 to TXWIDTH(PDMA_DSCTn_CTL[13:12]) to select the data width is 32 bit.
 - 5) Set 0x11 to DAINC(PDMA_DSCTn_CTL[11:10]) to select the destination address increment is 0.
9. Set PSIO_SC0CTL to start the slot controller.

- 1) Set 0 to TRIGSRC(PSIO_SC0CTL[15:14], SC0 Trigger Source) to determine the trigger source is by software.
- 2) Set 1 to START(PSIO_SC0CTL[16], SC0 START) to enable slot controller by software.

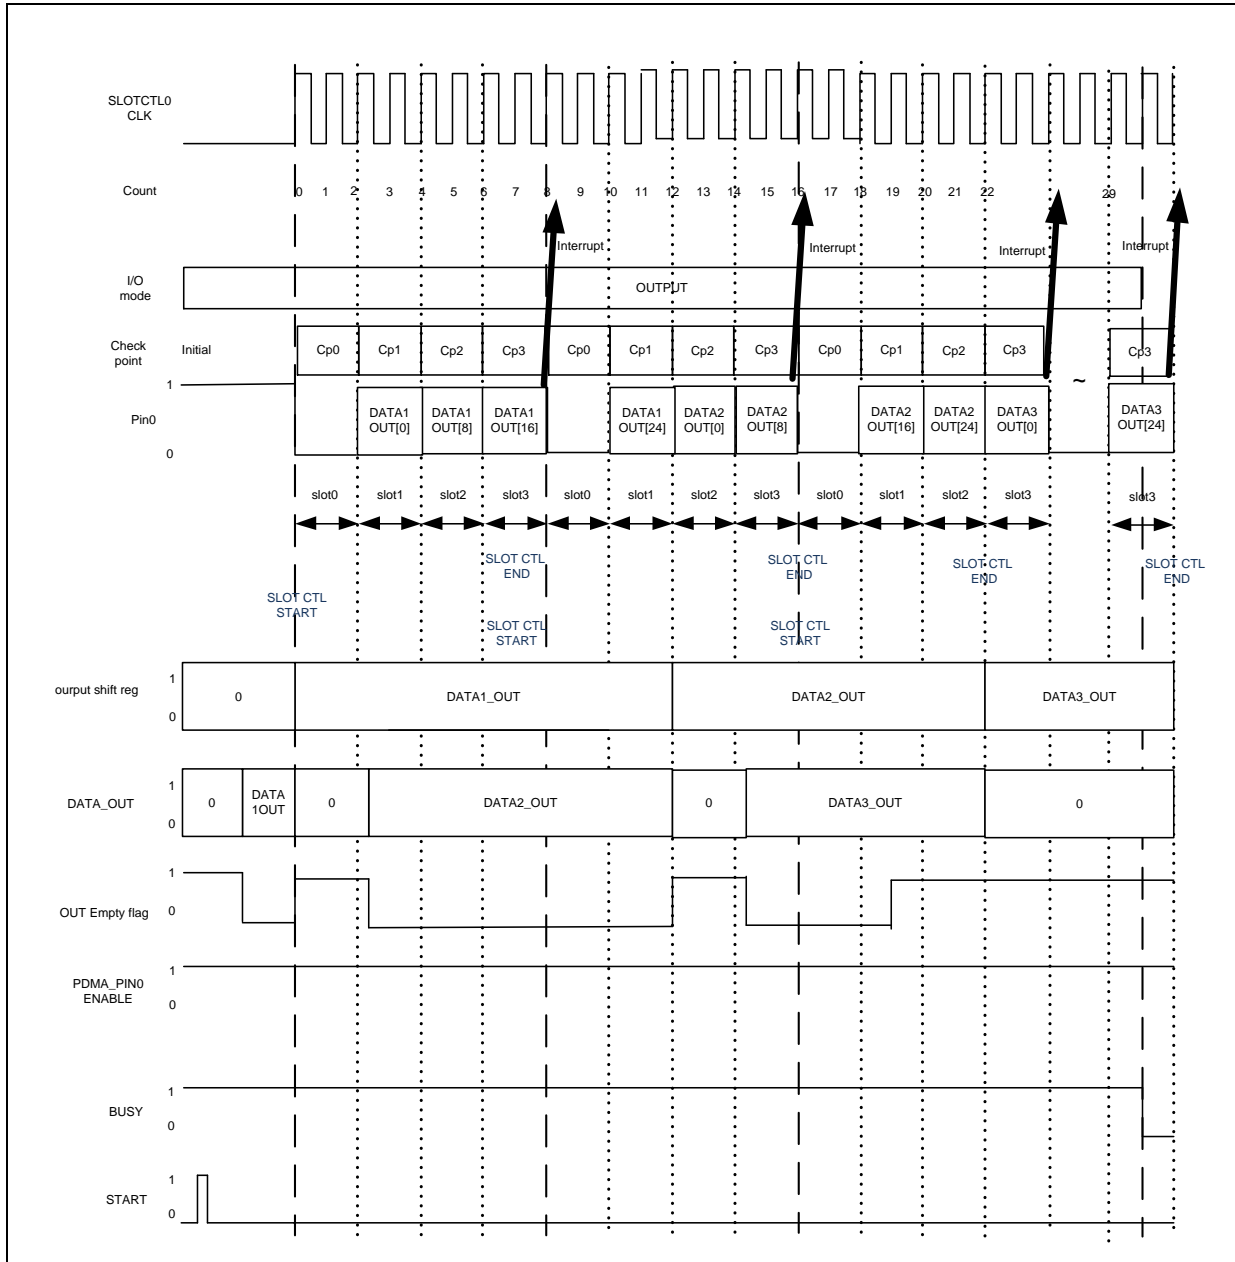

Figure 6.22-19 Programming Example with PDMA and Repeat Mode

6.22.7.5 Programming Example 2 - PDMA with OUTPUT DATA and Endless SLOT_PERIOD_LOOP_CNT

1. Set slot0 to slot7 of slot controller 0 to determine the slot length

- 1) Set the slot 0 length as 1 in SLOT0(PSIO_SC0SLOT[3:0] = 0x1).
 - 2) Set the slot 1 length as 1 in SLOT1(PSIO_SC0SLOT[7:4] = 0x1).
 - 3) Set the slot 2 length as 1 in SLOT2(PSIO_SC0SLOT[11:8] = 0x1).
 - 4) Set the slot 3 length as 1 in SLOT3(PSIO_SC0SLOT[15:12] = 0x1).
 - 5) Set the slot 4 length as 1 in SLOT4(PSIO_SC0SLOT[19:16] = 0x1).
 - 6) Set the slot 5 length as 1 in SLOT5(PSIO_SC0SLOT[23:20] = 0x1).
 - 7) Set the slot 6 length as 1 in SLOT6(PSIO_SC0SLOT[27:24] = 0x1).
 - 8) Set the slot 7 length as 1 in SLOT7(PSIO_SC0SLOT[31:28] = 0x1).
2. Set slot period loop count to endless and determine initial slot and end slot
 - 1) Set 0b111111 to SPLCNT (PSIO_SC0CTL[13:8], Slot Period Loop Count) let slot period with endless loop.
 - 2) Set 0x04 to INISLOT(PSIO_SC0CTL[3:0], Initial Slot Period) let slot period start from SLOT3.
 - 3) Set 0x06 ENDSLOT(PSIO_SC0CTL[7:4], End Slot Period) let slot period start end at SLOT5.
3. Set PIN0 general control register(PSIO0_GENCTL).
 - 1) Set 1 to INITIAL(PSIO0_GENCTL[3:2]) to determine the initial pin state.
 - 2) Set 0 to INTERVAL(PSIO0_GENCTL[5:4]) to determine the interval pin state.
 - 3) Set 0x1 to IOMODE(PSIO0_GENCTL[5:4]) to determine the initial I/O mode is OUTPUT mode.
4. Set PIN0 data controller (PSIO0_DATCTL) to determine the data property.
 - 1) Set 0 to ORDER(PSIO0_DATCTL[16]) to determine the data order is LSB.
 - 2) Set 0x0 to OUTDATWD(PSIO0_DATCTL[4:0]) to determine the output data width is 1 bit.
 - 3) Set 0x3 to OUTDEPTH(PSIO0_DATCTL[25:24]) to determine the output data depth is 4.
5. Set PIN0 check point controller 0 (PSIO0_CPCTL0) to determine which slot will be link to the check point.
 - 1) Set 0x1(SLOT0) to CKPT0(PSIO0_CPCTL0[3:0]) to link the slot0 to check point0.
 - 2) Set 0x2(SLOT1) to CKPT1(PSIO0_CPCTL0[7:4]) to link the slot1 to check point1.
 - 3) Set 0x3(SLOT2) to CKPT2(PSIO0_CPCTL0[11:8]) to link the slot2 to check point2.
 - 4) Set 0x4(SLOT3) to CKPT3(PSIO0_CPCTL0[15:12]) to link the slot3 to check point3.
 - 5) Set 0x5(SLOT4) to CKPT4(PSIO0_CPCTL0[19:16]) to link the slot4 to check point4.
 - 6) Set 0x6(SLOT5) to CKPT5(PSIO0_CPCTL0[23:20]) to link the slot5 to check point5.
 - 7) Set 0x7(SLOT6) to CKPT6(PSIO0_CPCTL0[27:24]) to link the slot6 to check point6.
 - 8) Set 0x8(SLOT7) to CKPT7(PSIO0_CPCTL0[31:28]) to link the slot7 to check point7.
6. Set PIN0 check point controller 1 (PSIO0_CP1CTL) to determine the check point action at the check points.
 - 1) Set 0x0(output 0) to CKPT0ACT(PSIO0_CPCTL1[2:0]) to output 0 at the check point 0.
 - 2) Set 0x1(output 1) to CKPT1ACT(PSIO0_CPCTL1[6:4]) to output 1 at the check point1.
 - 3) Set 0x0(output 0) to CKPT2ACT(PSIO0_CPCTL1[10:8]) to output 0 at the check point2.

- 4) Set 0x2(output data) to CKPT3ACT(PSIO0_CPCTL1[14:12]) to output data at the check point3.
- 5) Set 0x2(output data) to CKPT4ACT(PSIO0_CPCTL1[18:16]) to output data at the check point4.
- 6) Set 0x2(output data) to CKPT5ACT(PSIO0_CPCTL1[22:20]) to output data at the check point5.
7. Set PDMA related setting to output data from sram to PSIO
 - 1) Set 0x20000000 to PDMA_DSCTn_SA as source address.
 - 2) Set PSIO_PODAT address (PSIO_BA + 0x18) to PDMA_DSCTn_DA as detination address.
 - 3) Set TXCNT(PDMA_DSCTn_CTL[31:16]) = 2 to set PDMA transfer data to PSIO 3 times
 - 4) Set 0x10 to TXWIDTH(PDMA_DSCTn_CTL[13:12]) to select the data width is 32 bit.
 - 5) Set 0x11 to DAINC(PDMA_DSCTn_CTL[11:10]) to select the destination address imcrement is 0.
8. Set PSIO_SC0CTL to start the slot controller.
 - 1) Set 0 to TRIGSRC(PSIO_SC0CTL[15:14], SC0 Trigger Source) to determine the trigger source is by software.
 - 2) Set 1 to START(PSIO_SC0CTL[16], SC0 START) to ebable slot controller by software.

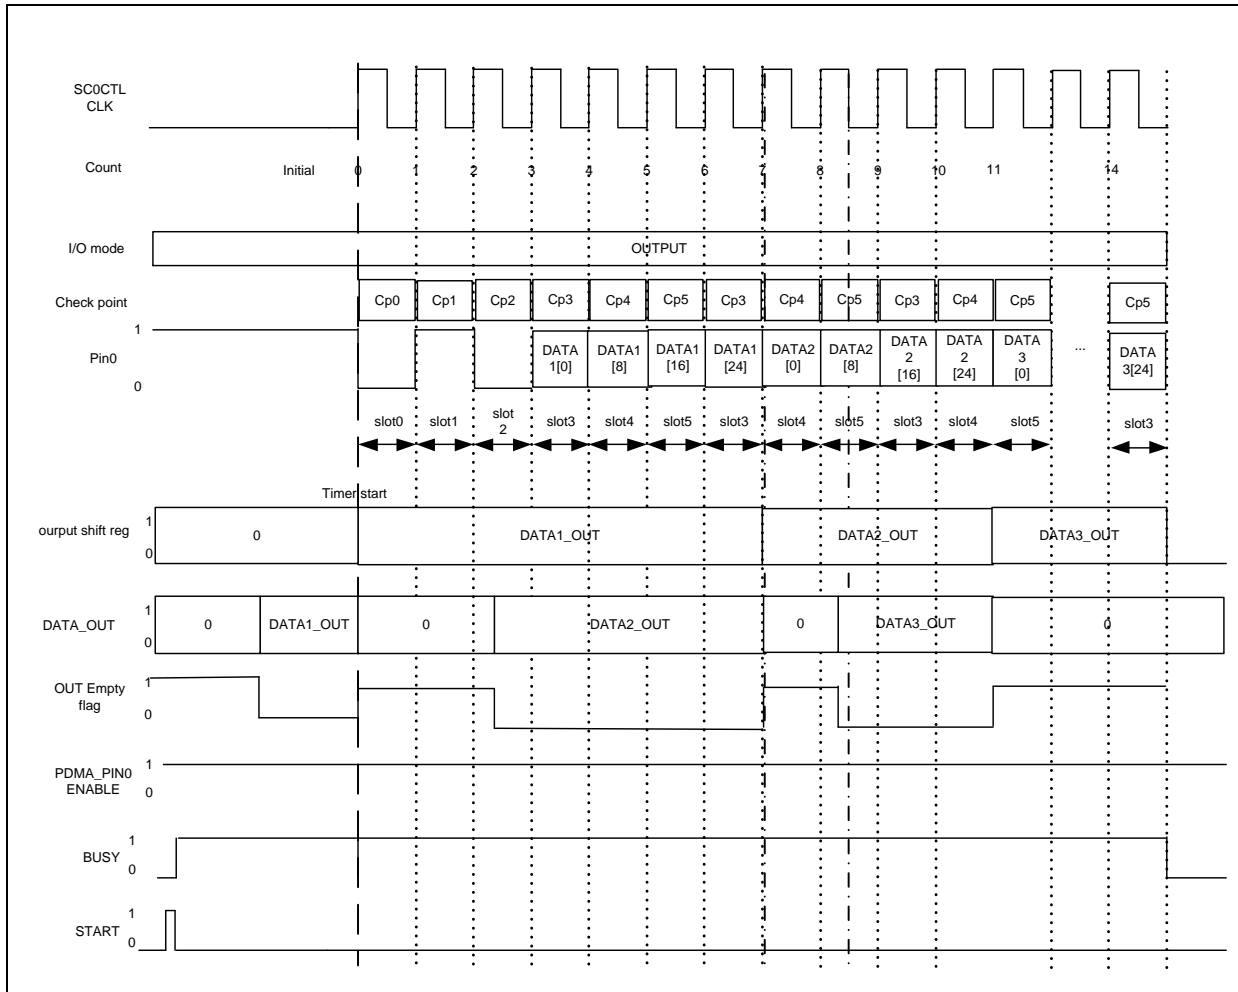

Figure 6.22-20 PDMA with OUTPUT DATA and Endless SLOT_PERIOD_LOOP_CNT

6.22.7.6 *Programing Example 3 - PDMA with OUTPUT DATA and SLOT CONTROLLER WHOLE REPEAT mode with 3 pins*

1. Set slot0 to slot3 of slot controller 0 to determine the slot length
 - 1) Set the slot 0 length as 1 in SLOT0(PSIO_SC0SLOT[3:0] = 0x1).
 - 2) Set the slot 1 length as 1 in SLOT1(PSIO_SC0SLOT[7:4] = 0x1).
 - 3) Set the slot 2 length as 1 in SLOT2(PSIO_SC0SLOT[11:8] = 0x1).
 - 4) Set the slot 3 length as 1 in SLOT3(PSIO_SC0SLOT[15:12] = 0x1).
2. Set slot0 to slot3 of slot controller 1 to determine the slot length
 - 1) Set the slot 0 length as 1 in SLOT0(PSIO_SC1SLOT[3:0] = 0x1).
 - 2) Set the slot 1 length as 1 in SLOT1(PSIO_SC1SLOT[7:4] = 0x1).
 - 3) Set the slot 2 length as 1 in SLOT2(PSIO_SC1SLOT[11:8] = 0x1).
 - 4) Set the slot 3 length as 1 in SLOT3(PSIO_SC1SLOT[15:12] = 0x1).
3. Set slot0 to slot3 of slot controller 2 to determine the slot length
 - 1) Set the slot 0 length as 1 in SLOT0(PSIO_SC2SLOT[3:0] = 0x1).
 - 2) Set the slot 1 length as 1 in SLOT1(PSIO_SC2SLOT[7:4] = 0x1).
 - 3) Set the slot 2 length as 1 in SLOT2(PSIO_SC2SLOT[11:8] = 0x1).
 - 4) Set the slot 3 length as 1 in SLOT3(PSIO_SC2SLOT[15:12] = 0x1).
4. Set slot repeat function of slot controller to determine the slot repeat mode.
 - 1) Set 1 to REPEAT(PSIO_SC0CTL[17], Whole Repeat Mode) to determine the repeat mode of slot controller 0.
 - 2) Set 1 to REPEAT(PSIO_SC1CTL[17], Whole Repeat Mode) to determine the repeat mode of slot controller 1.
 - 3) Set 1 to REPEAT(PSIO_SC2CTL[17], Whole Repeat Mode) to determine the repeat mode of slot controller 2.
5. Set PIN0 general control register(PSIO0_GENCTL).
 - 1) Set 1 to INITIAL(PSIO0_GENCTL[3:2]) to determine the initial pin state.
 - 2) Set 0 to INTERVAL(PSIO0_GENCTL[5:4]) to determine the interval pin state.
 - 3) Set 0x1 to IOMODE(PSIO0_GENCTL[5:4]) to determine the initial I/O mode is OUTPUT mode.
6. Set PIN1 general control register(PSIO1_GENCTL).
 - 1) Set 1 to INITIAL(PSIO1_GENCTL[3:2]) to determine the initial pin state.
 - 2) Set 0 to INTERVAL(PSIO1_GENCTL[5:4]) to determine the interval pin state.
 - 3) Set 0x1 to IOMODE(PSIO1_GENCTL[5:4]) to determine the initial I/O mode is OUTPUT mode.
7. Set PIN2 general control register(PSIO2_GENCTL).
 - 1) Set 1 to INITIAL(PSIO2_GENCTL[3:2]) to determine the initial pin state.
 - 2) Set 0 to INTERVAL(PSIO2_GENCTL[5:4]) to determine the interval pin state.
 - 3) Set 0x1 to IOMODE(PSIO2_GENCTL[5:4]) to determine the initial I/O mode is OUTPUT mode.

mode.

8. Set PIN0 data controller (PSIO0_DATCTL) to determine the data property.
 - 1) Set 0 to ORDER(PSIO0_DATCTL[16]) to determine the data order is LSB.
 - 2) Set 0x0 to OUTDATWD(PSIO0_DATCTL[4:0]) to determine the output data width is 1 bit.
 - 3) Set 0x3 to OUTDEPTH(PSIO0_DATCTL[25:24]) to determine the output data depth is 4.
9. Set PIN1 data controller (PSIO1_DATCTL) to determine the data property.
 - 1) Set 0 to ORDER(PSIO1_DATCTL[16]) to determine the data order is LSB.
 - 2) Set 0x0 to OUTDATWD(PSIO1_DATCTL[4:0]) to determine the output data width is 1 bit.
 - 3) Set 0x3 to OUTDEPTH(PSIO1_DATCTL[25:24]) to determine the output data depth is 4.
10. Set PIN2 data controller (PSIO2_DATCTL) to determine the data property.
 - 1) Set 0 to ORDER(PSIO2_DATCTL[16]) to determine the data order is LSB.
 - 2) Set 0x0 to OUTDATWD(PSIO2_DATCTL[4:0]) to determine the output data width is 1 bit.
 - 3) Set 0x3 to OUTDEPTH(PSIO2_DATCTL[25:24]) to determine the output data depth is 4.
11. Set PIN0 check point controller 0 (PSIO0_CPCTL0) to determine which slot will be link to the check point.
 - 1) Set 0x1(SLOT0) to CKPT0(PSIO0_CPCTL0[3:0]) to link the slot0 to check point0.
 - 2) Set 0x2(SLOT1) to CKPT1(PSIO0_CPCTL0[7:4]) to link the slot1 to check point1.
 - 3) Set 0x3(SLOT2) to CKPT2(PSIO0_CPCTL0[11:8]) to link the slot2 to check point2.
 - 4) Set 0x4(SLOT3) to CKPT3(PSIO0_CPCTL0[15:12]) to link the slot3 to check point3.
12. Set PIN1 check point controller 0 (PSIO1_CPCTL0) to determine which slot will be link to the check point.
 - 1) Set 0x1(SLOT0) to CKPT0(PSIO1_CPCTL0[3:0]) to link the slot0 to check point0.
 - 2) Set 0x2(SLOT1) to CKPT1(PSIO1_CPCTL0[7:4]) to link the slot1 to check point1.
 - 3) Set 0x3(SLOT2) to CKPT2(PSIO1_CPCTL0[11:8]) to link the slot2 to check point2.
 - 4) Set 0x4(SLOT3) to CKPT3(PSIO1_CPCTL0[15:12]) to link the slot3 to check point3.
13. Set PIN2 check point controller 0 (PSIO2_CPCTL0) to determine which slot will be link to the check point.
 - 1) Set 0x1(SLOT0) to CKPT0(PSIO2_CPCTL0[3:0]) to link the slot0 to check point0.
 - 2) Set 0x2(SLOT1) to CKPT1(PSIO2_CPCTL0[7:4]) to link the slot1 to check point1.
 - 3) Set 0x3(SLOT2) to CKPT2(PSIO2_CPCTL0[11:8]) to link the slot2 to check point2.
 - 4) Set 0x4(SLOT3) to CKPT3(PSIO2_CPCTL0[15:12]) to link the slot3 to check point3.
14. Set PIN0 check point controller 1 (PSIO0_CP1CTL) to determine the check point action at the check points.
 - 1) Set 0x2(output data) to CKPT0ACT(PSIO0_CPCTL1[2:0]) to output data at the check point 0.
 - 2) Set 0x2(output data) to CKPT1ACT(PSIO0_CPCTL1[6:4]) to output data at the check point1.
 - 3) Set 0x2(output data) to CKPT2ACT(PSIO0_CPCTL1[10:8]) to output data at the check point2.
 - 4) Set 0x2(output data) to CKPT3ACT(PSIO0_CPCTL1[14:12]) to output data at the check

point3.

15. Set PIN1 check point controller 1 (PSIO1_CP1CTL) to determine the check point action at the check points.
 - 1) Set 0x2(output data) to CKPT0ACT(PSIO1_CPCTL1[2:0]) to output data at the check point 0.
 - 2) Set 0x2(output data) to CKPT1ACT(PSIO1_CPCTL1[6:4]) to output data at the check point1.
 - 3) Set 0x2(output data) to CKPT2ACT(PSIO1_CPCTL1[10:8]) to output data at the check point2.
 - 4) Set 0x2(output data) to CKPT3ACT(PSIO1_CPCTL1[14:12]) to output data at the check point3.
16. Set PIN2 check point controller 1 (PSIO2_CP1CTL) to determine the check point action at the check points.
 - 1) Set 0x2(output data) to CKPT0ACT(PSIO2_CPCTL1[2:0]) to output data at the check point 0.
 - 2) Set 0x2(output data) to CKPT1ACT(PSIO2_CPCTL1[6:4]) to output data at the check point1.
 - 3) Set 0x2(output data) to CKPT2ACT(PSIO2_CPCTL1[10:8]) to output data at the check point2.
 - 4) Set 0x2(output data) to CKPT3ACT(PSIO2_CPCTL1[14:12]) to output data at the check point3.
17. Set PDMA related setting to output data from sram to PSIO
 - 1) Set 0x20000000 to PDMA_DSCTn_SA as source address.
 - 2) Set PSIO_PODAT address (PSIO_BA + 0x18) to PDMA_DSCTn_DA as detination address.
 - 3) Set TXCNT(PDMA_DSCTn_CTL[31:16]) = 5 to set PDMA transfer data to PSIO 6 times
 - 4) Set 0x10 to TXWIDTH(PDMA_DSCTn_CTL[13:12]) to select the data width is 32 bit.
 - 5) Set 0x11 to DAINC(PDMA_DSCTn_CTL[11:10]) to select the destination address imcrement is 0.
18. Set PSIO_SC0CTL to start the slot controller.
 - 1) Set 0 to TRIGSRC(PSIO_SC0CTL[15:14], SC0 Trigger Source) to determine the trigger source is by software.
 - 2) Set 1 to START(PSIO_SC0CTL[16], SC0 START) to ebable slot controller by software.

Pins

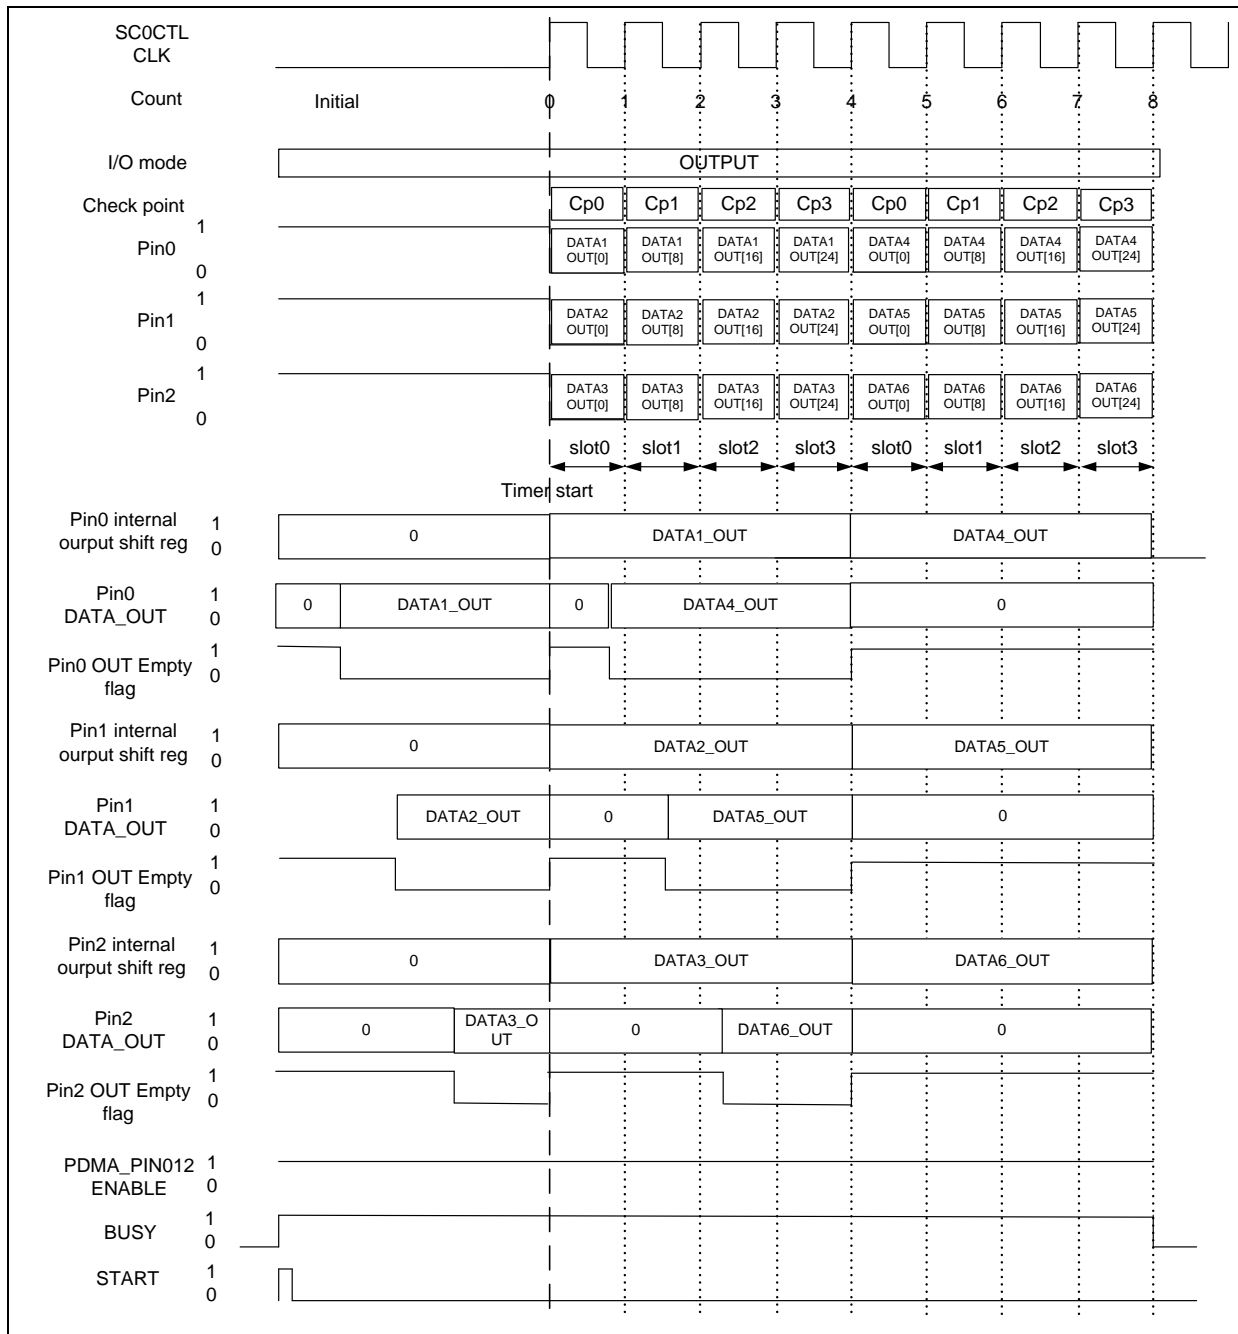

Figure 6.22-21 PDMA with OUTPUT DATA and SLOT CONTROLLER WHOLE REPEAT Mode with 3 Pins

6.22.7.7 Programming Example 4: PDMA with INPUT DATA and SLOT CONTROLLER WHOLE REPEAT mode

1. Set slot0 to slot3 of slot controller 0 to determine the slot length
 - 1) Set 1 to SLOT0(PSIO_SC0SLOT[3:0])
 - 2) Set 1 to SLOT1(PSIO_SC0SLOT[7:4])
 - 3) Set 1 to SLOT2(PSIO_SC0SLOT[11:8])
 - 4) Set 1 to SLOT3(PSIO_SC0SLOT[15:12])

2. Set slot repeat function to determine the slot repeat mode.
 - 1) Set 1 to REPEAT(PSIO_SC0CTL[17], Whole Repeat Mode) to determine the repeat mode.
3. Set PIN0 general control register(PSIO0_GENCTL).
 - 1) Set 0x00 to IOMODE(PSIO0_GENCTL[5:4]) to determine the initial I/O mode is INPUT mode.
 - 2) Set 0 to SCSEL(PSIO0_GENCTL[25:24])
4. Set PIN0 data controller (PSIO0_DATCTL) to determine the data property.
 - 1) Set 0 to ORDER(PSIO0_DATCTL[16]) to determine the data order is LSB.
 - 2) Set 0x0 to INDATWD(PSIO0_DATCTL[12:8]) to determine the input data width is 1 bit.
 - 3) Set 0x3 to INDEPTH(PSIO0_DATCTL[29:28]) to determine the input data depth is 4.
5. Set PIN0 check point controller 0 (PSIO0_CPCTL0) to determine which slot will be link to the check point.
 - 1) Set 0x1(SLOT0) to CKPT0(PSIO0_CPCTL0[3:0]) to link the slot0 to check point0.
 - 2) Set 0x2(SLOT1) to CKPT1(PSIO0_CPCTL0[7:4]) to link the slot1 to check point1.
 - 3) Set 0x3(SLOT2) to CKPT2(PSIO0_CPCTL0[11:8]) to link the slot2 to check point2.
 - 4) Set 0x4(SLOT3) to CKPT3(PSIO0_CPCTL0[15:12]) to link the slot3 to check point3.
6. Set PIN0 check point controller 1 (PSIO0_CP1CTL) to determine the check point action at the check points.
 - 1) Set 0x5 (input data) to CKPT0ACT(PSIO0_CPCTL1[2:0]) to input data at the check point 0.
 - 2) Set 0x5(input data) to CKPT1ACT(PSIO0_CPCTL1[6:4]) to input data at the check point1.
 - 3) Set 0x5 (input data) to CKPT2ACT(PSIO0_CPCTL1[10:8]) to input data at the check point2.
 - 4) Set 0x5 (input data) to CKPT3ACT(PSIO0_CPCTL1[14:12]) to input data at the check point3.
7. Set PDMA related setting to receive data from PSIO to SRAM
 - 1) Set PSIO_PIDAT address (PSIO_BA + 0x1C) to PDMA_DSCTn_SA as source address.
 - 2) Set 0x20000000 to PDMA_DSCTn_DA as destination address.
 - 3) Set TXCNT(PDMA_DSCTn_CTL[31:16]) = 2 to set PDMA transfer data from PSIO 3 times.
 - 4) Set 0x10 to TXWIDTH(PDMA_DSCTn_CTL[13:12]) to select the data width is 32 bit.
 - 5) Set 0x11 to SAINC(PDMA_DSCTn_CTL[9:8]) to select the source address increment is 0.
8. Set 0x1 to TRIGSRC(PSIO_SC0CTL[15:14], SC0 Trigger Source) to determine the trigger source is by falling edge.

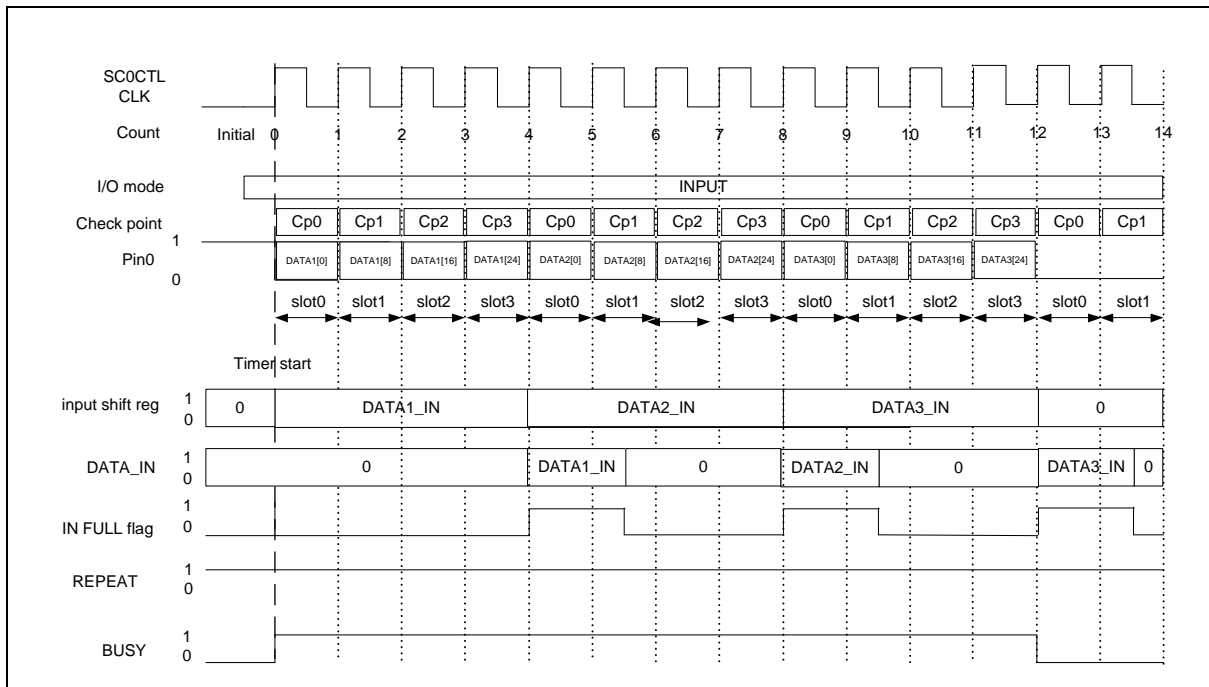

Figure 6.22-22 PDMA with INPUT DATA and SLOT CONTROLLER WHOLE REPEAT mode

6.22.7.8 Programming Example 5: PDMA with INPUT DATA and Endless SLOT_PERIOD_LOOP_CNT

1. Set slot0 to slot7 of slot controller 0 to determine the slot length
 - 1) Set the slot 0 length as 1 in SLOT0(PSIO_SC0SLOT[3:0] = 0x1).
 - 2) Set the slot 1 length as 1 in SLOT1(PSIO_SC0SLOT[7:4] = 0x1).
 - 3) Set the slot 2 length as 1 in SLOT2(PSIO_SC0SLOT[11:8] = 0x1).
 - 4) Set the slot 3 length as 1 in SLOT3(PSIO_SC0SLOT[15:12] = 0x1).
 - 5) Set the slot 4 length as 1 in SLOT4(PSIO_SC0SLOT[19:16] = 0x1).
2. Set slot period loop count to endless and determine initial slot and end slot
 - 1) Set 0b111111 to SPLCNT (PSIO_SC0CTL[13:8], Slot Period Loop Count) let slot period with endless loop.
 - 2) Set 0b0010(SLOT1) to INISLOT(PSIO_SC0CTL[3:0], Initial Slot Period) let slot period start from SLOT1.
 - 3) Set 0b0101(SLOT) to ENDSLOT(PSIO_SC0CTL[7:4], End Slot Period) let slot period start end at SLOT4.
3. Set PIN0 general control register(PSIO0_GENCTL).
 - 1) Set 0x00 to IOMODE(PSIO0_GENCTL[5:4]) to determine the initial I/O mode is INPUT mode.
 - 2) Set 0 to SCSEL(PSIO0_GENCTL[25:24])
4. Set PIN0 data controller (PSIO0_DATCTL) to determine the data property.
 - 1) Set 0 to ORDER(PSIO0_DATCTL[16]) to determine the data order is LSB.
 - 2) Set 0x0 to INDATWD(PSIO0_DATCTL[12:8]) to determine the input data width is 1 bit.
 - 3) Set 0x3 to INDEPTH(PSIO0_DATCTL[29:28]) to determine the input data depth is 4.

5. Set PIN0 check point controller 0 (PSIO0_CPCTL0) to determine which slot will be link to the check point.
 - 1) Set 0x1(SLOT0) to CKPT0(PSIO0_CPCTL0[3:0]) to link the slot0 to check point0.
 - 2) Set 0x2(SLOT1) to CKPT1(PSIO0_CPCTL0[7:4]) to link the slot1 to check point1.
 - 3) Set 0x3(SLOT2) to CKPT2(PSIO0_CPCTL0[11:8]) to link the slot2 to check point2.
 - 4) Set 0x4(SLOT3) to CKPT3(PSIO0_CPCTL0[15:12]) to link the slot3 to check point3.
 - 5) Set 0x5(SLOT4) to CKPT4(PSIO0_CPCTL0[19:16]) to link the slot4 to check point4.
6. Set PIN0 check point controller 1 (PSIO0_CP1CTL) to determine the check point action at the check points.
 - 1) Set 0b101(input status) to CKPT0ACT(PSIO0_CPCTL1[2:0]) to input status at the check point 0.
 - 2) Set 0b100(input data) to CKPT1ACT(PSIO0_CPCTL1[6:4]) to input data at the check point1.
 - 3) Set 0b100(input data) to CKPT2ACT(PSIO0_CPCTL1[10:8]) to input data at the check point2.
 - 4) Set 0b100 (input data) to CKPT3ACT(PSIO0_CPCTL1[14:12]) to input data at the check point3.
 - 5) Set 0b100 (input data) to CKPT4ACT(PSIO0_CPCTL1[18:16]) to input data at the check point4.
7. Set PDMA related setting to receive data from PSIO to SRAM
 - 1) Set PSIO_PIDAT address (PSIO_BA + 0x1C) to PDMA_DSCTn_SA as source address.
 - 2) Set 0x20000000 to PDMA_DSCTn_DA as destination address.
 - 3) Set TXCNT(PDMA_DSCTn_CTL[31:16]) = 1 to set PDMA transfer data from PSIO 2 times.
 - 4) Set 0x10 to TXWIDTH(PDMA_DSCTn_CTL[13:12]) to select the data width is 32 bit.
 - 5) Set 0x11 to SAINC(PDMA_DSCTn_CTL[9:8]) to select the source address increment is 0.
8. Set PSIO_SC0CTL to start the slot controller.
 - 1) Set 0x1 to TRIGSRC(PSIO_SC0CTL[15:14], SC0 Trigger Source) to determine the trigger source is by falling edge.

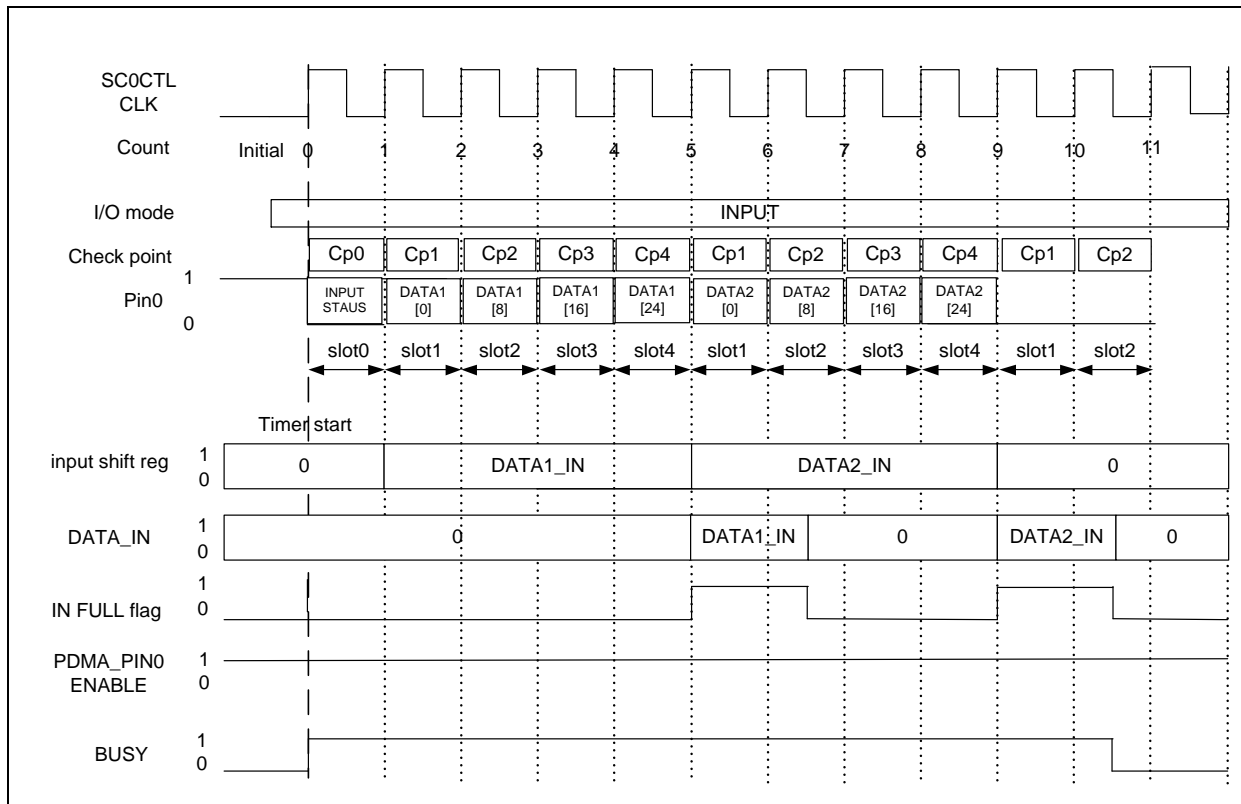

Figure 6.22-23 PDMA with INPUT DATA and Endless SLOT_PERIOD_LOOP_CNT

6.22.7.9 Programing Example 6: PDMA with INPUT DATA and SLOT CONTROLLER WHOLE REPEAT mode with 2 pins

1. Set slot0 to slot3 of slot controller 0 to determine the slot length
 - 1) Set the slot 0 length as 1 in SLOT0(PSIO_SC0SLOT[3:0] = 0x1).
 - 2) Set the slot 1 length as 1 in SLOT1(PSIO_SC0SLOT[7:4] = 0x1).
 - 3) Set the slot 2 length as 1 in SLOT2(PSIO_SC0SLOT[11:8] = 0x1).
 - 4) Set the slot 3 length as 1 in SLOT3(PSIO_SC0SLOT[15:12] = 0x1).
2. Set slot0 to slot3 of slot controller 1 to determine the slot length
 - 1) Set the slot 0 length as 1 in SLOT0(PSIO_SC1SLOT[3:0] = 0x1).
 - 2) Set the slot 1 length as 1 in SLOT1(PSIO_SC1SLOT[7:4] = 0x1).
 - 3) Set the slot 2 length as 1 in SLOT2(PSIO_SC1SLOT[11:8] = 0x1).
 - 4) Set the slot 3 length as 1 in SLOT3(PSIO_SC1SLOT[15:12] = 0x1).
3. Set slot0 to slot3 of slot controller 2 to determine the slot length
 - 1) Set the slot 0 length as 1 in SLOT0(PSIO_SC2SLOT[3:0] = 0x1).
 - 2) Set the slot 1 length as 1 in SLOT1(PSIO_SC2SLOT[7:4] = 0x1).
 - 3) Set the slot 2 length as 1 in SLOT2(PSIO_SC2SLOT[11:8] = 0x1).
 - 4) Set the slot 3 length as 1 in SLOT3(PSIO_SC2SLOT[15:12] = 0x1).
4. Set slot repeat function of slot controller to determine the slot repeat mode.

- 1) Set 1 to REPEAT(PSIO_SC0CTL[17], Whole Repeat Mode) to determine the repeat mode of slot controller 0.
 - 2) Set 1 to REPEAT(PSIO_SC1CTL[17], Whole Repeat Mode) to determine the repeat mode of slot controller 1.
 - 3) Set 1 to REPEAT(PSIO_SC2CTL[17], Whole Repeat Mode) to determine the repeat mode of slot controller 2.
5. Set PIN0 general control register(PSIO0_GENCTL).
- 1) Set 0b10 to IOMODE(PSIO0_GENCTL[5:4]) to determine the initial I/O mode is INPUT mode.
 - 2) Set 0 to SCSEL(PSIO0_GENCTL[25:24])
6. Set PIN1 general control register(PSIO1_GENCTL).
- 1) Set 0b10 to IOMODE(PSIO1_GENCTL[5:4]) to determine the initial I/O mode is INPUT mode.
 - 2) Set 0 to SCSEL(PSIO1_GENCTL[25:24])
7. Set PIN2 general control register(PSIO2_GENCTL).
- 1) Set 0b10 to IOMODE(PSIO2_GENCTL[5:4]) to determine the initial I/O mode is INPUT mode.
 - 2) Set 0 to SCSEL(PSIO1_GENCTL[25:24])
8. Set PIN0 data controller (PSIO0_DATCTL) to determine the data property.
- 1) Set 0 to ORDER(PSIO0_DATCTL[16]) to determine the data order is LSB.
 - 2) Set 0x0 to INDATWD(PSIO0_DATCTL[12:8]) to determine the input data width is 1 bit.
 - 3) Set 0x3 to INDEPTH(PSIO0_DATCTL[29:28]) to determine the input data depth is 4.
9. Set PIN1 data controller (PSIO1_DATCTL) to determine the data property.
- 1) Set 0 to ORDER(PSIO1_DATCTL[16]) to determine the data order is LSB.
 - 2) Set 0x0 to INDATWD(PSIO1_DATCTL[12:8]) to determine the input data width is 1 bit.
 - 3) Set 0x3 to INDEPTH(PSIO1_DATCTL[29:28]) to determine the input data depth is 4.
10. Set PIN2 data controller (PSIO2_DATCTL) to determine the data property.
- 1) Set 0 to ORDER(PSIO2_DATCTL[16]) to determine the data order is LSB.
 - 2) Set 0x0 to INDATWD(PSIO2_DATCTL[12:8]) to determine the input data width is 1 bit.
 - 3) Set 0x3 to INDEPTH(PSIO2_DATCTL[29:28]) to determine the input data depth is 4.
11. Set PIN0 check point controller 0 (PSIO0_CPCTL0) to determine which slot will be link to the check point.
- 1) Set 0x1(SLOT0) to CKPT0(PSIO0_CPCTL0[3:0]) to link the slot0 to check point0.
 - 2) Set 0x2(SLOT1) to CKPT1(PSIO0_CPCTL0[7:4]) to link the slot1 to check point1.
 - 3) Set 0x3(SLOT2) to CKPT2(PSIO0_CPCTL0[11:8]) to link the slot2 to check point2.
 - 4) Set 0x4(SLOT3) to CKPT3(PSIO0_CPCTL0[15:12]) to link the slot3 to check point3.
12. Set PIN1 check point controller 0 (PSIO1_CPCTL0) to determine which slot will be link to the check point.
- 1) Set 0x1(SLOT0) to CKPT0(PSIO1_CPCTL0[3:0]) to link the slot0 to check point0.
 - 2) Set 0x2(SLOT1) to CKPT1(PSIO1_CPCTL0[7:4]) to link the slot1 to check point1.

- 3) Set 0x3(SLOT2) to CKPT2(PSIO1_CPCTL0[11:8]) to link the slot2 to check point2.
 - 4) Set 0x4(SLOT3) to CKPT3(PSIO1_CPCTL0[15:12]) to link the slot3 to check point3.
13. Set PIN2 check point controller 0 (PSIO2_CPCTL0) to determine which slot will be link to the check point.
- 1) Set 0x1(SLOT0) to CKPT0(PSIO2_CPCTL0[3:0]) to link the slot0 to check point0.
 - 2) Set 0x2(SLOT1) to CKPT1(PSIO2_CPCTL0[7:4]) to link the slot1 to check point1.
 - 3) Set 0x3(SLOT2) to CKPT2(PSIO2_CPCTL0[11:8]) to link the slot2 to check point2.
 - 4) Set 0x4(SLOT3) to CKPT3(PSIO2_CPCTL0[15:12]) to link the slot3 to check point3.
14. Set PIN0 check point controller 1 (PSIO0_CP1CTL) to determine the check point action at the check points.
- 1) Set 0b100 (input data) to CKPT0ACT(PSIO0_CPCTL1[2:0]) to input data at the check point 0.
 - 2) Set 0b100 (input data) to CKPT1ACT(PSIO0_CPCTL1[6:4]) to input data at the check point1.
 - 3) Set 0b100 (input data) to CKPT2ACT(PSIO0_CPCTL1[10:8]) to input data at the check point2.
 - 4) Set 0b100 (input data) to CKPT3ACT(PSIO0_CPCTL1[14:12]) to input data at the check point3.
15. Set PIN1 check point controller 1 (PSIO1_CP1CTL) to determine the check point action at the check points.
- 1) Set 0b100 (input data) to CKPT0ACT(PSIO1_CPCTL1[2:0]) to input data at the check point 0.
 - 2) Set 0b100 (input data) to CKPT1ACT(PSIO1_CPCTL1[6:4]) to input data at the check point1.
 - 3) Set 0b100 (input data) to CKPT2ACT(PSIO1_CPCTL1[10:8]) to input data at the check point2.
 - 4) Set 0b100 (input data) to CKPT3ACT(PSIO1_CPCTL1[14:12]) to input data at the check point3.
16. Set PIN2 check point controller 1 (PSIO2_CP1CTL) to determine the check point action at the check points.
- 1) Set 0b100 (input data) to CKPT0ACT(PSIO2_CPCTL1[2:0]) to input data at the check point 0.
 - 2) Set 0b100 (input data) to CKPT1ACT(PSIO2_CPCTL1[6:4]) to input data at the check point1.
 - 3) Set 0b100 (input data) to CKPT2ACT(PSIO2_CPCTL1[10:8]) to input data at the check point2.
 - 4) Set 0b100 (input data) to CKPT3ACT(PSIO2_CPCTL1[14:12]) to input data at the check point3.
17. Set PDMA related setting to receive data from PSIO to SRAM
- 1) Set PSIO_PIDAT address (PSIO_BA + 0x1C) to PDMA_DSCTn_SA as source address.
 - 2) Set 0x20000000 to PDMA_DSCTn_DA as destination address.
 - 3) Set TXCNT(PDMA_DSCTn_CTL[31:16]) = 3 to set PDMA transfer data from PSIO 4 times.
 - 4) Set 0x10 to TXWIDTH(PDMA_DSCTn_CTL[13:12]) to select the data width is 32 bit.

- 5) Set 0x11 to SAINC(PDMA_DSCTn_CTL[9:8]) to select the source address increment is 0.
18. Set PSIO_SC0CTL to start the slot controller.
Set 0x1 to TRIGSRC(PSIO_SC0CTL[15:14], SC0 Trigger Source) to determine the trigger source is by falling edge.

6.23 External Bus Interface (EBI)

6.23.1 Overview

This chip is equipped with an external bus interface (EBI) for external device use. To save the connections between an external device and a chip, EBI is operating at address bus and data bus multiplex mode. The EBI supports three chip selects that can connect three external devices with different timing setting requirements.

6.23.2 Features

- Supports up to three memory banks
- Supports dedicated external chip select pin with polarity control for each bank
- Supports accessible space up to 1 Mbytes for each bank, actually external addressable space is dependent on package pin out
- Supports 8-/16-bit data width
- Supports byte write in 16-bit data width mode
- Supports Address/Data multiplexed Mode
- Supports Timing parameters individual adjustment for each memory block
- Supports LCD interface i80 mode
- Supports PDMA mode
- Supports variable external bus base clock (MCLK) which based on HCLK
- Supports configurable idle cycle for different access condition: Idle of Write command finish (W2X) and Idle of Read-to-Read (R2R)

6.23.5 Functional Description

6.23.5.1 EBI Area and Address Hit

The EBI mapping address is located at 0x6000_0000 ~ 0x602F_FFFF and the total memory space is 3 Mbytes. When system request address hits EBI's memory space, the corresponding EBI chip select signal is assert and EBI state machine operates.

Chip Select	Address Mapping
EBI_nCS0	0x6000_0000 ~ 0x600F_FFFF
EBI_nCS1	0x6010_0000 ~ 0x601F_FFFF
EBI_nCS2	0x6020_0000 ~ 0x602F_FFFF

Table 6.23-1 EBI Address Mapping

To map the whole EBI memory space, it requires 20-bit address for 8-bit data width device and 19-bit address for 16-bit data width device. For package that output less than 20-bit address, EBI will map device to mirror space. For example, the package with 18-bit EBI address, EBI will mapped external device (for Bank0/EBI_nCS0) to 0x6000_0000 ~ 0x6003_FFFF, 0x6004_0000 ~ 0x6007_FFFF, 0x6008_0000 ~ 0x600B_FFFF and 0x600C_0000 ~ 0x600F_FFFF simultaneously.

6.23.5.2 EBI Data Width Connection - Address Bus and Data Bus Multiplex Mode

The EBI supports the device whose address bus and data bus are multiplexed. For the external device with separated address and data bus, the connection to device needs additional latch device to latch the address. In this case, the pin EBI_ALE is connected to the latch device to latch the address value. Pin EBI_AD is the input of the latch device, and the output of the latch device is connected to the address of external device.

For 16-bit device, the EBI_AD [15:0] is shared by address and 16-bit data, and EBI_ADR [18:16] is dedicated for address and could be connected to 16-bit device directly. The EBI_ADR[19] will be ignored when EBI data width is set as 16-bit width. For 8-bit device, only EBI_AD [7:0] is shared by address and 8-bit data, EBI_AD[15:8] and EBI_ADR[19:16] are dedicated for address and could be connected to 8-bit device directly. Figure 6.23-2 shows the connection of 16-bit data width device and Figure 6.23-3 shows the connection of 8-bit data width device.

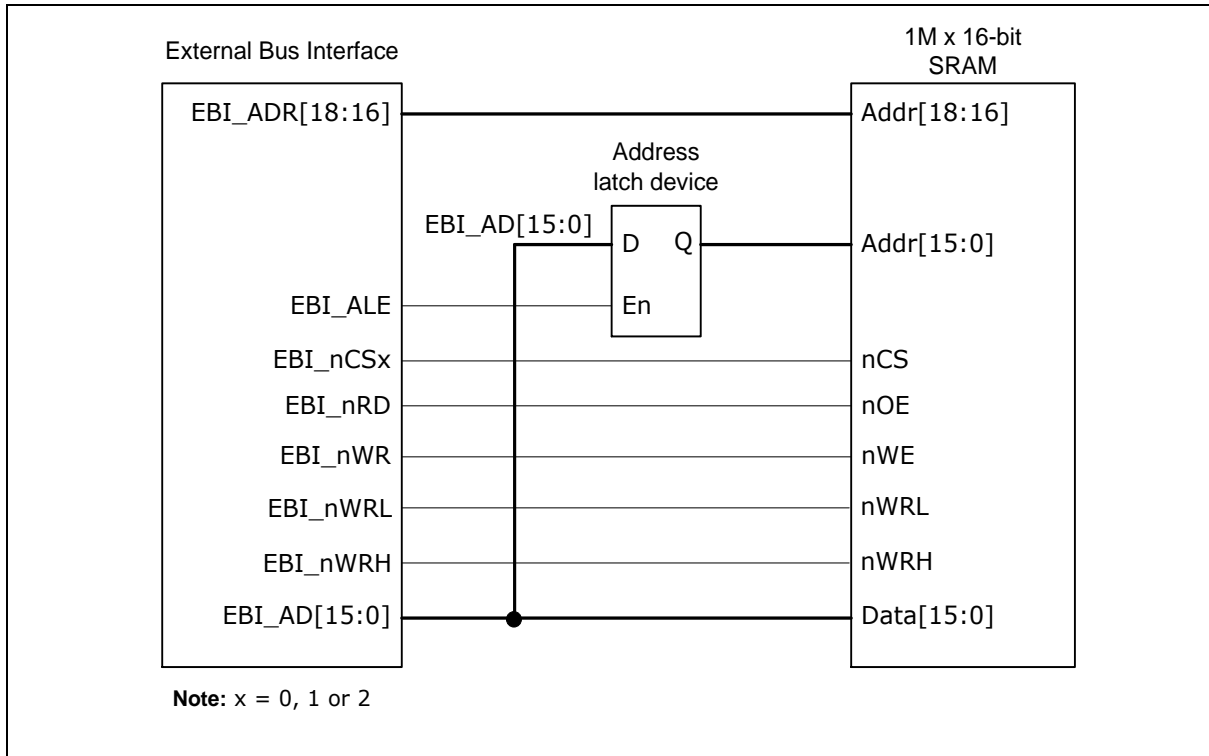

Figure 6.23-2 Connection of 16-bit EBI Data Width with 16-bit Device

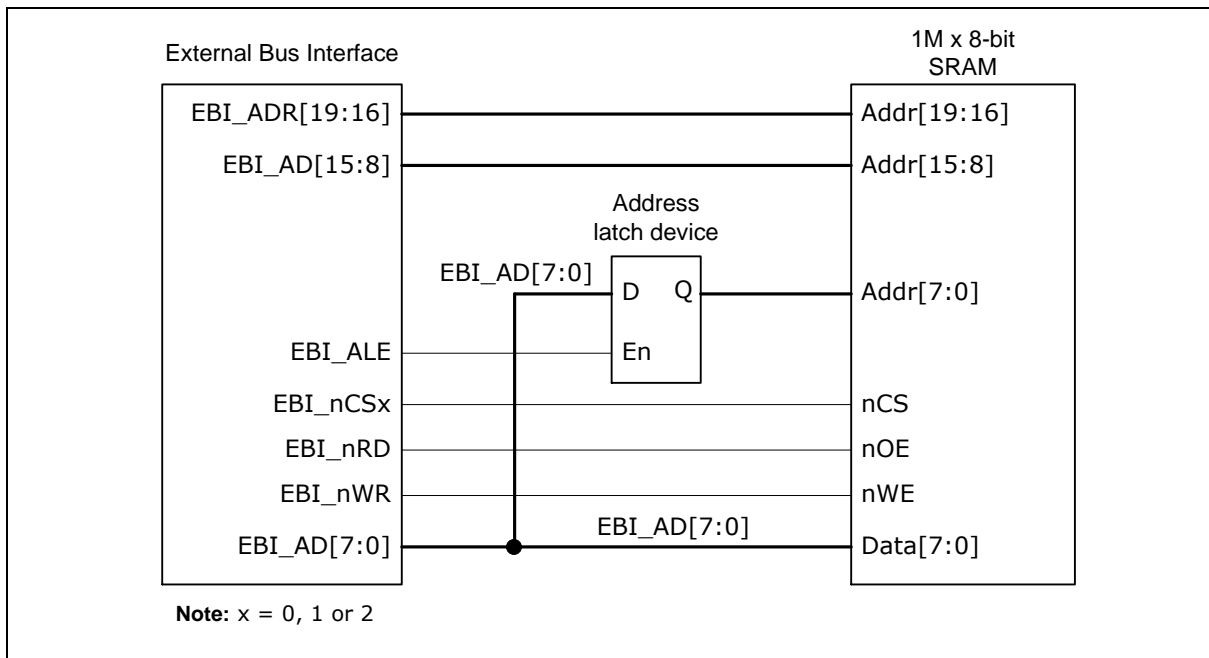

Figure 6.23-3 Connection of 8-bit EBI Data Width with 8-bit Device

When system access data width is larger than EBI data width, the EBI controller will finish a system access command by operating EBI access more than once. For example, if system requests a 32-bit data through EBI device, the EBI controller will operate accessing four times when setting EBI data width with 8-bit.

6.23.5.3 EBI Operating Control

MCLK Control

In the chip, all EBI signals will be synchronized by EBI_MCLK when EBI is operating. When chip connects to the external device with slower operating frequency, the EBI_MCLK can divide most to HCLK/32 by setting MCLKDIV (EBI_CTLx[10:8]). Therefore, chip can be suitable for a wide frequency range of EBI device. If EBI_MCLK is set to HCLK/1, EBI signals are synchronized by positive edge of EBI_MCLK, else by negative edge of EBI_MCLK.

Operation and Access Timing Control

At the start of EBI access, chip select (EBI_nCS0, EBI_nCS1 and EBI_nCS2) asserts to low and wait one EBI_MCLK for address setup time (tASU) for address stable. Then EBI_ALE asserts to high after address is stable and keeps for a period of time (tALE) for address latch. After latch address, EBI_ALE asserts to low and wait one EBI_MCLK for latch hold time (tLHD) and another one EBI_MCLK cycle (tA2D) that is inserted behind address hold time to be the bus turn-around time for address change to data. Then EBI_nRD asserts to low when read access or EBI_nWR asserts to low when write access. Then EBI_nRD or EBI_nWR asserts to high after keeps access time (tACC) for reading output stable or writing finish. After that, EBI signals keep for data access hold time (tAHD) and chip select asserts to high, address is released by current access control.

The EBI controller provides a flexible timing control for different external device. In EBI timing control, tASU, tLHD and tA2D are fixed to 1 EBI_MCLK cycle, tAHD can modulate to 1~8 EBI_MCLK cycles by setting TAHD (EBI_TCTLx[10:8]), tACC can modulate to 1~32 EBI_MCLK cycles by setting TACC (EBI_TCTLx[7:3]), and tALE can modulate to 1~8 EBI_MCLK cycles by setting TALE (EBI_CTL0[18:16]). Some external device can support zero data access hold time accessing, the EBI controller can skipped tAHD to increase access speed by setting WAHD OFF (EBI_TCTLx[23]) and RAHD OFF (EBI_TCTLx[22]).

For each chip select, the EBI provides individual register with timing control except that tALE can only be controlled by EBI_CTL0.

Parameter	Value	Unit	Description
tASU	1	MCLK	Address Latch Setup Time.
tALE	1 ~ 8	MCLK	ALE High Period. Controlled by TALE (EBI_CTL0[18:16]).
tLHD	1	MCLK	Address Latch Hold Time.
tA2D	1	MCLK	Address To Data Delay (Bus Turn-Around Time).
tACC	1 ~ 32	MCLK	Data Access Time. Controlled by TACC (EBI_TCTLx[7:3]).
tAHD	1 ~ 8	MCLK	Data Access Hold Time. Controlled by TAHD (EBI_TCTLx[10:8]).
IDLE	0 ~ 15	MCLK	Idle Cycle. Controlled by R2R (EBI_TCTLx[27:24]) and W2X (EBI_TCTLx[15:12]).

Table 6.23-2 Timing Control Parameter

Figure 6.23-4 shows an example of setting 16-bit data width. In this example, EBI_AD bus is used for being address [15:0] and data [15:0]. When EBI_ALE assert to high, EBI_AD is address output. After address is latched, EBI_ALE asserts to low and the EBI_AD bus change to high impedance to wait device output data in read access operation, or it is used for being write data output.

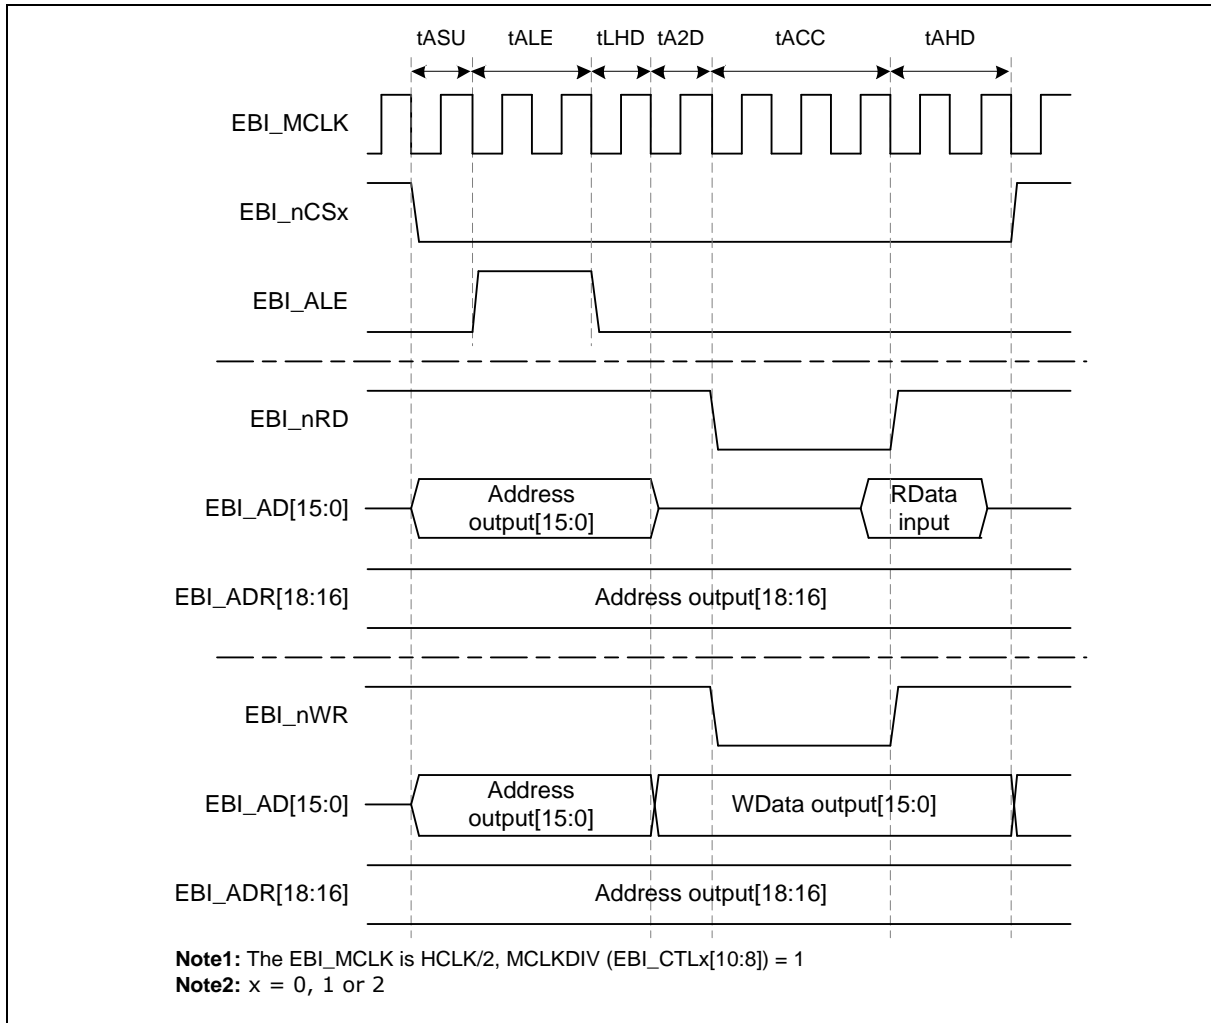

Figure 6.23-4 Timing Control Waveform for 16-bit Data Width

Figure 6.23-5 shows an example of setting 8-bit data width. The difference between 8-bit and 16-bit data width is EBI_AD[15:8]. In 8-bit data width setting, EBI_AD[15:8] is always Address [15:8] output so that external latch needs only 8-bit width.

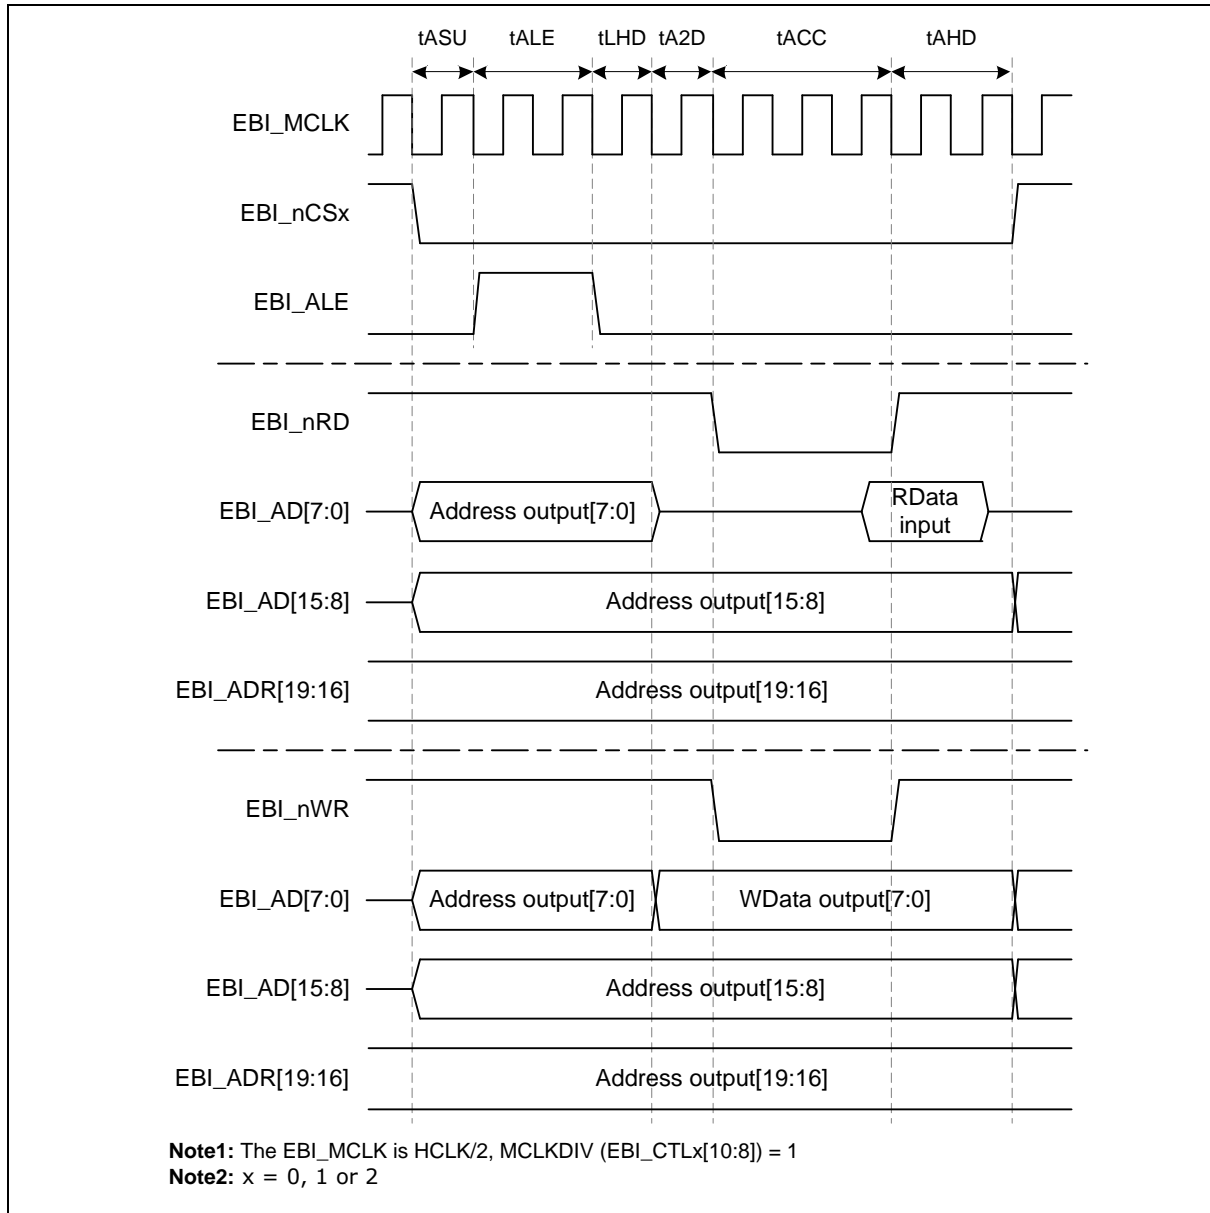

Figure 6.23-5 Timing Control Waveform for 8-bit Data Width

Byte Access

The EBI supports byte access when connected to 16-bit device. The pin EBI_nWRH and EBI_nWRL assertion indicate high byte enable and low byte enable in 16-bit data bus. Figure 6.23-6 shows the write operation of 8-bit width data in EBI_AD[15:8] with EBI_nWRH assertion.

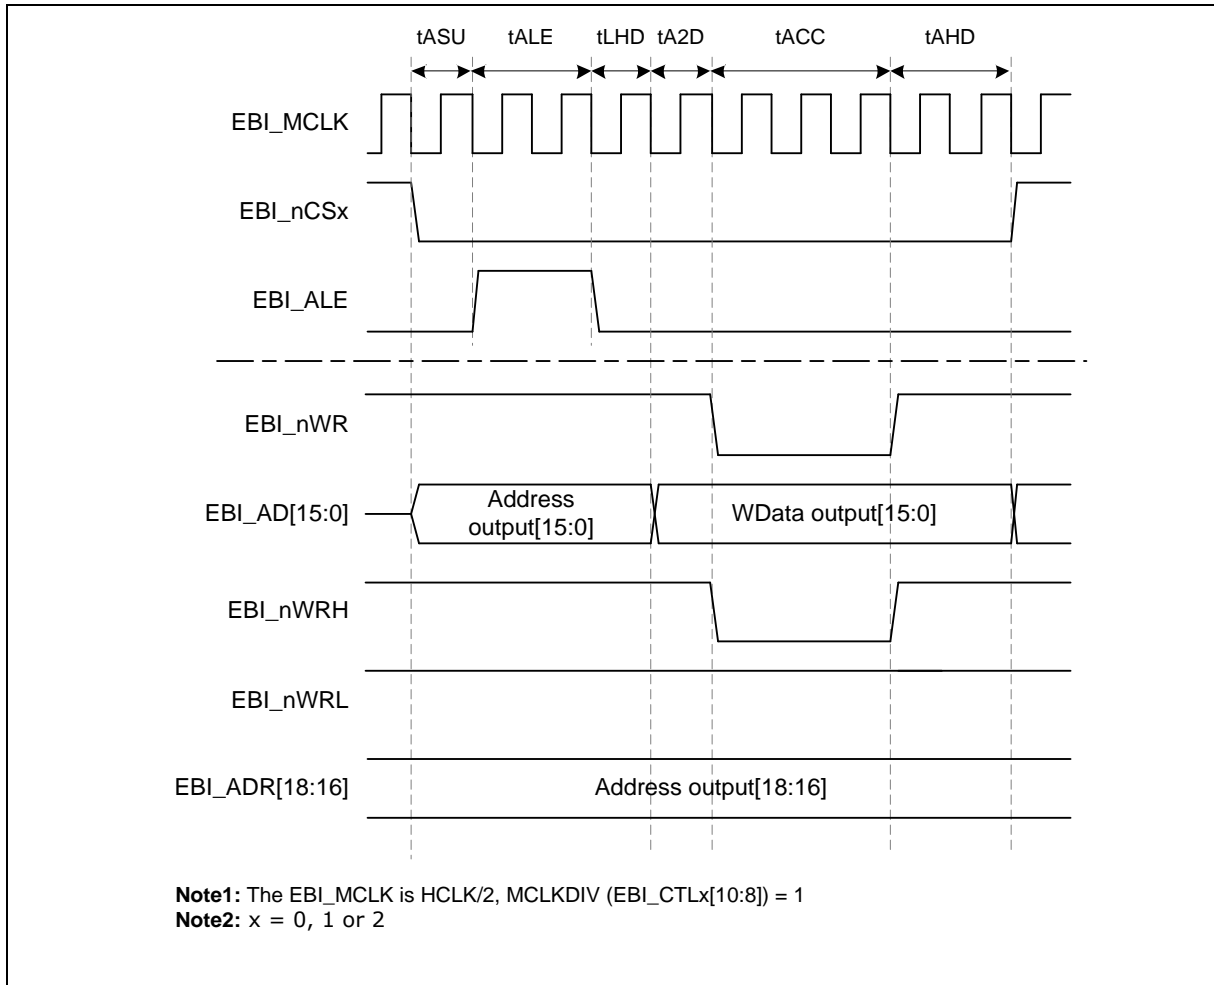

Figure 6.23-6 Timing Control Waveform for Byte Write in 16-bit Data Mode

Insert Idle Cycle

When EBI accesses continuously, there may occur bus conflict if the device access time is much slow with system operating. The EBI controller supplies additional idle cycle to solve this problem. During idle cycle, all control signals of EBI are inactive. Figure 6.23-7 shows idle cycles.

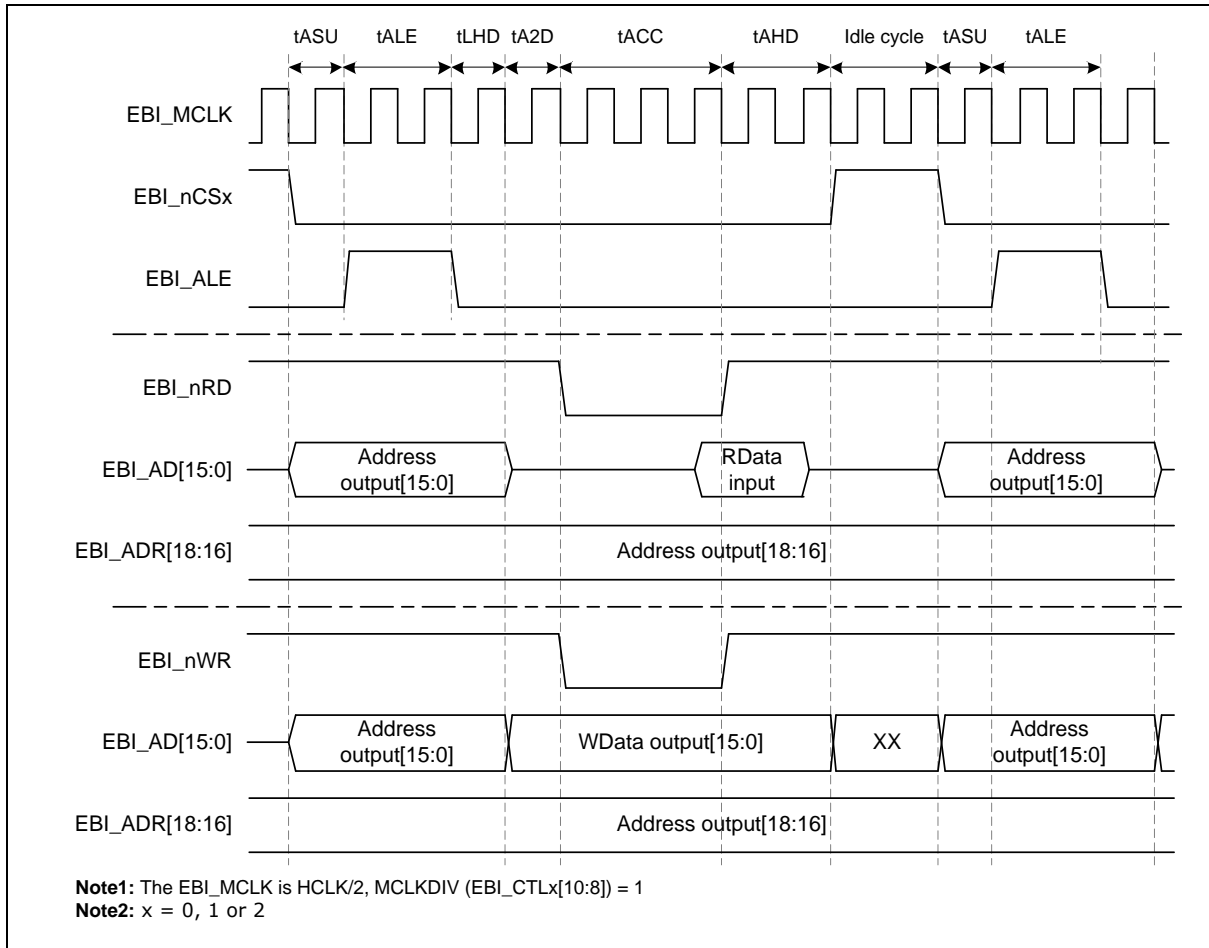

Figure 6.23-7 Timing Control Waveform for Insert Idle Cycle

There are two conditions that EBI can insert idle cycle by timing control:

1. After write access
2. After read access and before next read access (R2R idle cycle)

By setting W2X (EBI_TCTLx[15:12]), and R2R (EBI_TCTLx[27:24]), the time of idle cycle can be specified from 0~15 EBI_MCLK.

Chip Select Polarity Control

The EBI supports chip select polarity control for connecting to variable external device. When CSPOLINV (EBI_CTLx[2]) is set to 0, the chip select pins (EBI_nCSx) works as low active behavior. It means the external device can be access under EBI_nCSx at low state. When CSPOLINV (EBI_CTLx[2]) is set to 1, the chip select pin (EBI_nCS) works as high active behavior. It means the external device can be access under EBI_nCSx at high state.

Write Buffer

When user writes data to an external device through EBI bus, the EBI controller will start processing the write action immediately and the CPU is held until current EBI write action is finished. User can enable write buffer function to improve CPU and EBI access performance. When EBI write buffer function is enabled, the CPU can continuously execute other instruction during EBI controller process the write action to external device. There is one exception condition for this case. If CPU executes another data access through EBI bus when EBI process write action, the CPU will be held.

User can enable write buffer by setting WBUFEN (EBI_CTL0[24]).

Continuous Data Access Mode

The EBI supports continuous data access mode for the device which needs faster data access and do not need address control interface. User can enable this mode by setting CACCESS (EBI_CTLx[4]) for each bank. When EBI set as continuous data access mode, the tASU, tALE, tLHD cycles are ignored and EBI can access data continuously within one read or write command. There will be dummy cycle between each access command. The timing waveform is shown as Figure 6.23-8.

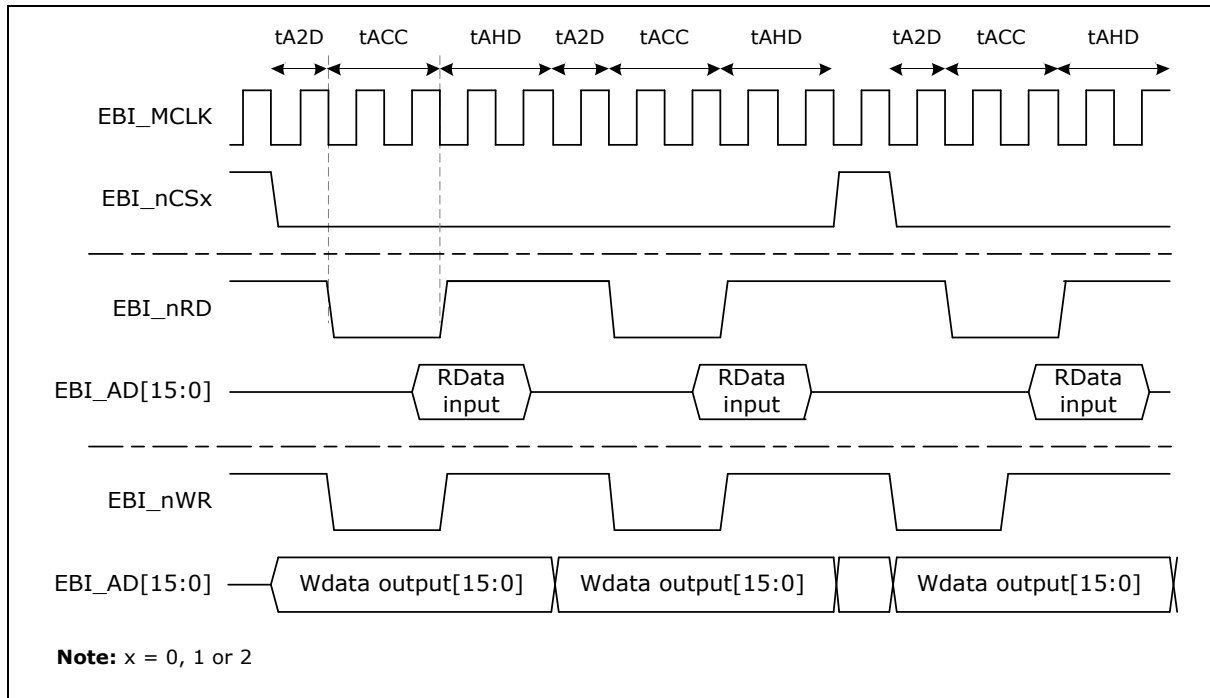

Figure 6.23-8 Timing Control Waveform for Continuous Data Access Mode

6.24 USB 1.1 Device Controller (USBD)

6.24.1 Overview

There is one set of USB 2.0 full-speed device controller and transceiver in this device. It is compliant with USB 2.0 full-speed device specification and supports control/bulk/interrupt/isochronous transfer types.

In this device controller, there are two main interfaces: the APB bus and USB bus which comes from the USB PHY transceiver. For the APB bus, the CPU can program control registers through it. There are 1 Kbytes internal SRAM as data buffer in this controller. For IN or OUT transfer, it is necessary to write data to SRAM or read data from SRAM through the APB interface or SIE. User needs to set the effective starting address of SRAM for each endpoint buffer through buffer segmentation register (USBD_BUFSEGx).

There are 12 endpoints in this controller. Each of the endpoint can be configured as IN or OUT endpoint. All the operations including Control, Bulk, Interrupt and Isochronous transfer are implemented in this block. The block of "Endpoint Control" is also used to manage the data sequential synchronization, endpoint states, current start address, transaction status, and data buffer status for each endpoint.

There are five different interrupt events in this controller. They are the no-event-wake-up, device plug-in or plug-out event, USB events, like IN ACK, OUT ACK etc, and BUS events, like suspend and resume, etc. Any event will cause an interrupt, and users just need to check the related event flags in interrupt event status register (USBD_INTSTS) to acknowledge what kind of interrupt occurring, and then check the related USB Endpoint Status Register (USBD_EPSTS0 and USBD_EPSTS1) to acknowledge what kind of event occurring in this endpoint.

A software-disconnect function is also supported for this USB controller. It is used to simulate the disconnection of this device from the host. If user enables SE0 bit (USBD_SE0), the USB controller will force the output of USB_D+ and USB_D- to level low and its function is disabled. After disable the SE0 bit, host will enumerate the USB device again.

For more information on the Universal Serial Bus, please refer to *Universal Serial Bus Specification Revision 1.1*.

6.24.2 Features

- Compliant with USB 2.0 Full-Speed specification
- Provides 1 interrupt vector with 5 different interrupt events (SOF, NEVWK, VBUSDET, USB and BUS)
- Supports Control/Bulk/Interrupt/Isochronous transfer type
- Supports suspend function when no bus activity existing for 3 ms
- Supports 12 endpoints for configurable Control/Bulk/Interrupt/Isochronous transfer types and maximum 1 Kbytes buffer size
- Provides remote wake-up capability

6.24.3 Block Diagram

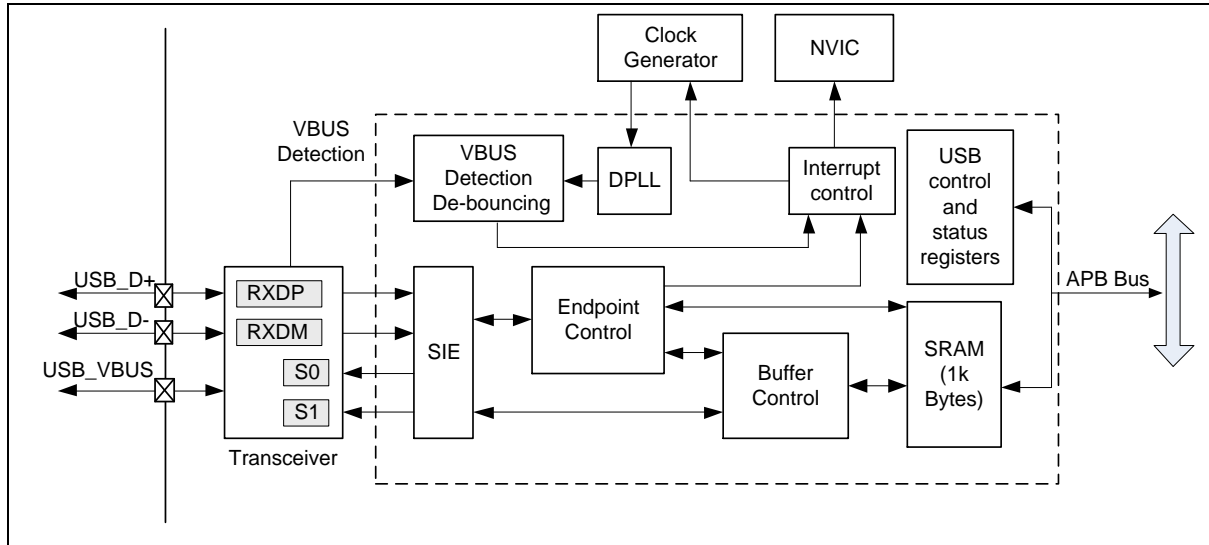

Figure 6.24-1 USB Block Diagram

6.24.4 Basic Configuration

The USB clock source is derived from HIRC or PLL. If user would like to achieve crystalless, HIRC must be selected as USB clock source, or user has to use the PLL related configurations with crystal before USB device controller is enabled. Set the USBCKEN (CLK_APBCLK0[27]) bit to enable USB clock and 4-bit pre-scaler USBDIV (CLK_CLKDIV0[7:4]) to generate the proper USB clock rate.

6.24.4.1 USB Device 1.1 Basic Configuration

- Clock source Configuration
 - Enable HIRC (CLK_PWRCTL[2]) or set PLL controller (CLK_PLLCTL)
 - Set USBSEL(CLK_CLKSEL0[8]) to select USB clock source from HIRC or PLL
 - Select the clock divider number of USB peripheral clock on USBDIV(CLK_CLKDIV0[7:4])
 - Enable USB peripheral clock in USBCKEN (CLK_APBCLK0[27])
- Reset Configuration
 - Reset USB controller in USBDRST (SYS_IPRST1[27])

6.24.5 Functional Description

6.24.5.1 Serial Interface Engine (SIE)

The SIE is the front-end of the device controller and handles most of the USB packet protocol. The SIE typically comprehends signaling up to the transaction level. The functions that it handles could include:

- Packet recognition and transaction sequencing
- SOP, EOP, RESET, RESUME signal detection/generation
- Clock/Data separation
- NRZI Data encoding/decoding and bit-stuffing
- CRC generation and checking (for Token and Data)
- Packet ID (PID) generation and checking/decoding

- Serial-Parallel/Parallel-Serial conversion

6.24.5.2 Endpoint Control

This controller supports 12 endpoints. Each of the endpoint can be configured as Control, Bulk, Interrupt, or Isochronous transfer type. All the operations including Control, Bulk, Interrupt and Isochronous transfer are implemented in this block. It is also used to manage the data sequential synchronization, endpoint state control, current endpoint start address, current transaction status, and data buffer status in each endpoint.

6.24.5.3 Digital Phase Lock Loop (DPLL)

The bit rate of USB data is 12 MHz. The DPLL uses the 48 MHz which comes from the clock controller to lock the input data RXDP and RXDM. The 12 MHz bit rate clock is also converted from DPLL.

6.24.5.4 VBUS Detection De-bouncing

A USB device may be plugged-in or plugged-out from the USB host. To monitor the state of a USB device when it is detached from the USB host, the device controller provides hardware de-bouncing for USB VBUS detection interrupt to avoid bounce problems on USB plug-in or unplug. VBUS detection interrupt appears about 10 ms later than USB plug-in or plug-out. User can acknowledge USB plug-in/plug-out by reading USBD_VBUSDET register. The VBUSDET flag represents the current state on the bus without de-bouncing. If VBUSDET is 1, it means the USB cable is plugged-in. If user polls the flag to check USB state, software de-bouncing must be added if needed.

6.24.5.5 Interrupt control

This USB provides 1 interrupt vector with 5 interrupt events (SOF, NEVWK, VBUSDET, USB and BUS).The SOF interrupt occurs after receiving SOF packet. The NEVWK event occurs after waking up the system from Power-down mode (The power mode function is defined in system power-down control register, CLK_PWRCTL). The VBUSDET event is used for USB plug-in or unplug. The USB event notifies users of some USB requests, such as IN ACK, OUT ACK. And the BUS event notifies users of some bus events, such as suspend and resume. The related bits must be set in the interrupt enable register (USB_D_INTEN) of USB Device Controller to enable USB interrupts.

NEVWK interrupt is only presented when no the other USB interrupt events happened more than 20ms after the chip is waked up from Power-down mode. After the chip enters Power-down mode, any power change on USB_VBUS or receiving resume event in USB suspend state can wake up this chip if USB wake-up function is enabled. If this change is not intentionally, no interrupt but NEVWK interrupt will occur. After waking up by USB, this interrupt will occur when no the other USB interrupt events are presented for more than 20ms. Figure 6.24-2 shows the control flow of wake-up interrupt.

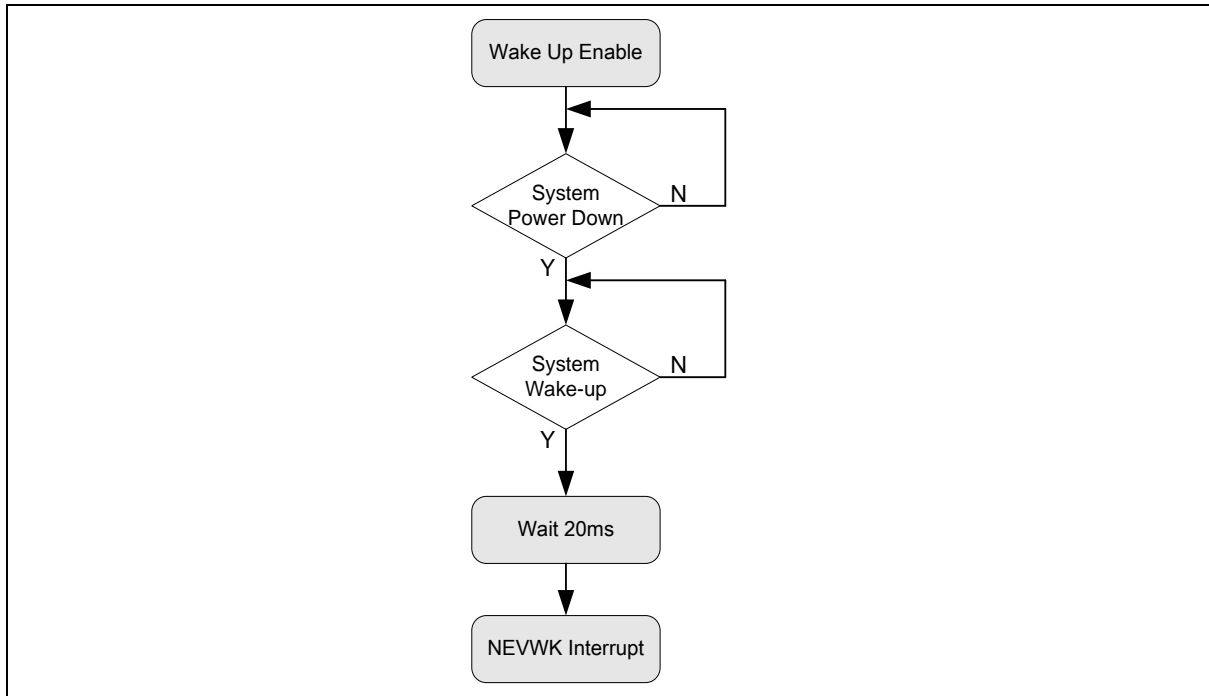

Figure 6.24-2 NEVWK Interrupt Operation Flow

The USB interrupt is used to notify users of any USB event on the bus, and user can read EPSTS (USBD_EPSTS0 and USBD_EPSTS1) and EPEVT11~0 (USBD_INTSTS[27:16]) to take necessary responses.

Same as USB interrupt, BUS interrupt notifies users of some bus events, like USB reset, suspend, time-out, and resume. A user can read USBD_ATTR to acknowledge bus events.

6.24.5.6 Power Saving

User can write 0 to USBD_ATTR[4] to disable PHY under special circumstances, like suspend, to conserve power.

6.24.5.7 Buffer Control

There is 1 Kbytes SRAM in the controller and the 12 endpoints share this buffer. User shall configure each endpoint's effective starting address in the buffer segmentation register before the USB function active. The "Buffer Control" block is used to control each endpoint's effective starting address and its SRAM size is defined in the USBD_MXPLDx register.

Figure 6.24-3 depicts the starting address for each endpoint according the content of USBD_BUFSEGx and USBD_MXPLDx registers. If the USBD_BUFSEG0 is programmed as 0x08h and USBD_MXPLD0 is set as 0x40h, the SRAM size of endpoint 0 is start from USBD_BA+0x108h and end in USBD_BA+0x148h.

Note: The USBD SRAM base is USBD_BA+0x100h.

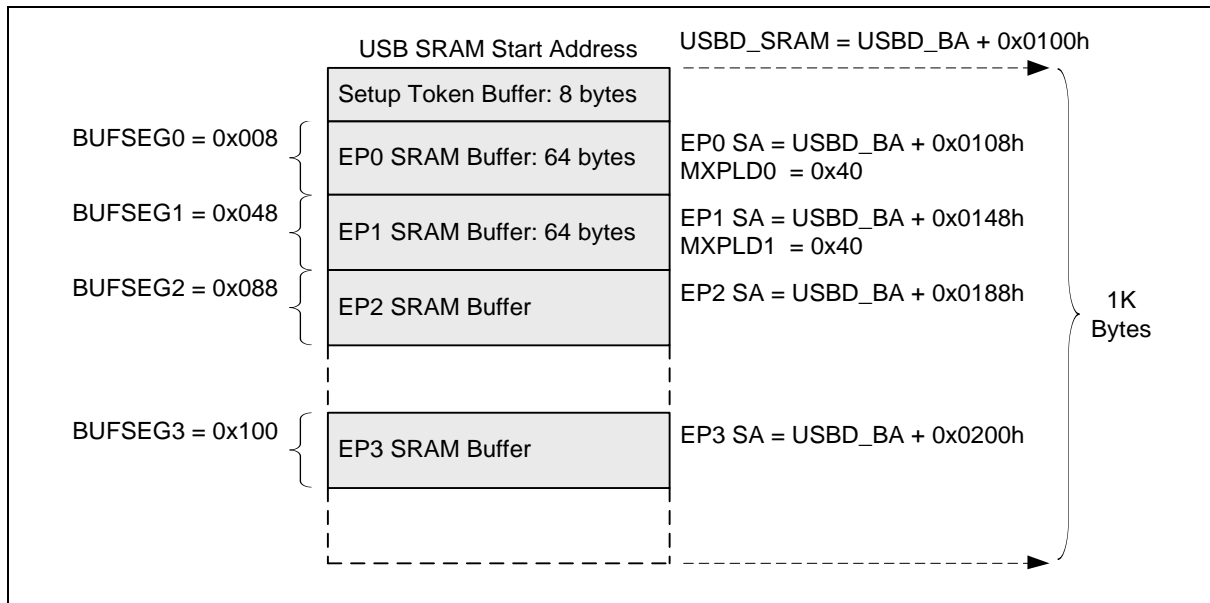

Figure 6.24-3 Endpoint SRAM Structure

6.24.5.8 Handling Transactions with USB Device Peripheral

User can use interrupt or polling USBD_INTSTS to monitor the USB transactions. When transactions occur, USBD_INTSTS will be set by hardware and send an interrupt request to CPU (if related interrupt enabled), or user can polling USBD_INTSTS to get these events without interrupt. The following is the control flow with interrupt enabled.

When USB host has requested data from a device controller, user needs to prepare related data in the specified endpoint buffer in advance. After buffering the required data, user needs to write the actual data length in the specified USBD_MXPLDx register. Once this register is written, the internal signal “In_Rdy” will be asserted and the buffering data will be transmitted immediately after receiving associated IN token from Host. Note that after transferring the specified data, the signal “In_Rdy” will de-assert automatically by hardware.

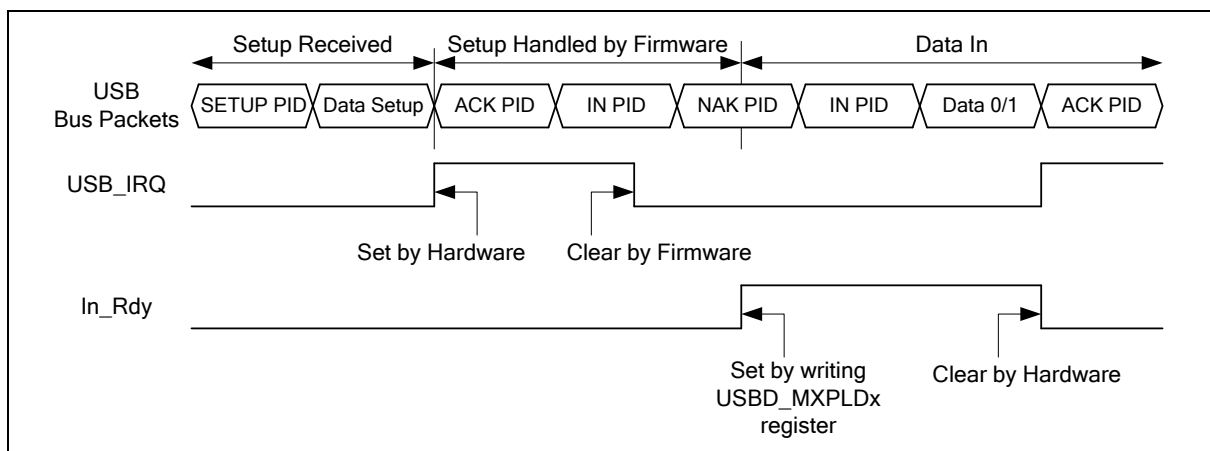

Figure 6.24-4 Setup Transaction Followed by Data IN Transaction

Alternatively, when USB host wants to transmit data to the OUT endpoint in the device controller, hardware will buffer these data to the specified endpoint buffer. After this transaction is completed, hardware will record the data length in specified USBD_MXPLDx register and de-assert the internal signal “Out_Rdy”. This will avoid hardware accepting next transaction until user moves out the current data in the related endpoint buffer. Once users have processed this transaction, the specified

USB_D_MXPLDx register needs to be written by firmware to assert the signal “Out_Rdy” again to accept the next transaction.

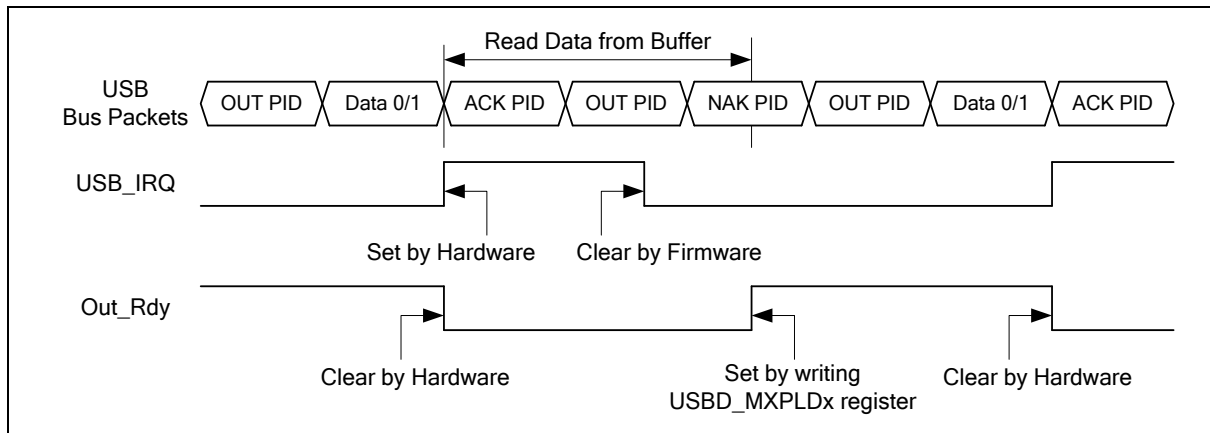

Figure 6.24-5 Data Out Transfer

6.24.5.9 Link Power Management (LPM)

Power Management (LPM) which is similar to the suspend/resume function, but has transitional latencies of tens of microseconds between power states (instead of three to greater than 20 millisecond latencies of the USB2.0 suspend/resume)

New fast mechanism for transitioning the bus on a root port from an enable state (called L0), to a new sleep state (called L1), detail define for L0 and L1 state see Table 6.24-1, the register USB_D_ATTR & USB_D_LPMATTR can let user know current power state for LPM mechanism.

LPM State	Description
L0 (On)	In this state, the port is enabled for propagation of transaction signaling traffic. A port in L0 is either actively transmitting or receiving data (L0-Active) or able to do so but not currently transmitting or receiving information (L0-Idle). While in this state Start-of-Frame (SOF) packets are issued by the host at a rate corresponding to the speed of the client device.
L1 (Sleep)	L1 is similar to L2 (below) but supports finer granularity in use. When in L1, the line state is identical to L2. Entry to L1 is started by a request to a hub or host port to transition to L1. A LPM transaction is sent to the downstream device. The requested transition can only occur if the device response with an ACK handshake. Exit from L1 is via remote wake, resume signaling, reset signaling or disconnect. L1 does not impose any specific power draw requirements (from VBUS) on the attached device as L2 does. Either the host or device can initiate resume signaling when in L1. Although the signaling levels of resume are the same as L2, the duration of the signaling and transitional latencies associated with the L1 to L0 transition are much shorter.
L2 (Suspend)	This is the formalized name for USB 2.0 Suspend, Entry to L2 is nominally triggered by a command to a hub or host port to transition to suspend. The device discovers the suspend condition via observing 3ms of inactivity. The resultant line state is either Low or Full-speed idle. L2 also imposes power draw requirements (from VBUS) on the attached device. Exit from this state is via remote wake, resume signaling, reset signaling or disconnect.
L3 (Off)	In this state, the port is not capable of performing any data signaling. It corresponds to the powered-off, disconnected, and disabled states.

Table 6.24-1 USB Link Power Manager (Lx) States

The state transaction process please refer to Figure 6.24-6, and for more information on the USB Link Power Manager(LPM), please refer to USB2.0 Link Power Management ECN.

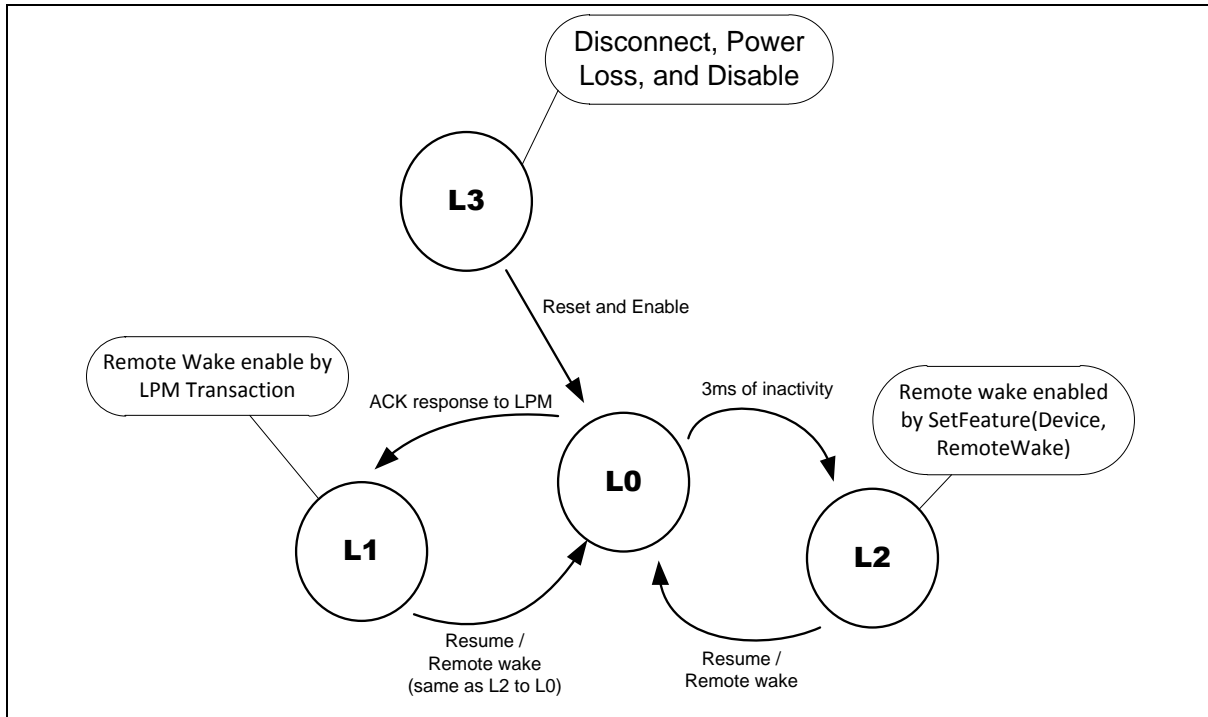

Figure 6.24-6 LPM State Transition Diagram

Bits	Description	
[31:14]	Reserved	Reserved.
[13]	L1RESUME	LPM L1 Resume (Read Only) 0 = Bus no LPM L1 state resume. 1 = LPM L1 state resume from LPM L1 state suspend.
[12]	L1SUSPEND	LPM L1 Suspend (Read Only) 0 = Bus no L1 state suspend. 1 = This bit is set by the hardware when LPM command to enter the L1 state is successfully received and acknowledged.
[11]	LPMACK	LPM Token Acknowledge Enable Bit The NYET/ACK will be returned only on a successful LPM transaction if no errors in both the EXT token and the LPM token and a valid bLinkState = 0001 (L1) is received, else ERROR and STALL will be returned automatically, respectively. 0= the valid LPM Token will be NYET. 1= the valid LPM Token will be ACK.
[10]	BYTEM	CPU Access USB SRAM Size Mode Selection 0 = Word mode: The size of the transfer from CPU to USB SRAM can be Word only. 1 = Byte mode: The size of the transfer from CPU to USB SRAM can be Byte only.
[9]	PWRDN	Power-down PHY Transceiver, Low Active 0 = Power-down related circuit of PHY transceiver. 1 = Turn-on related circuit of PHY transceiver.
[8]	DPPUEN	Pull-up Resistor on USB_DP Enable Bit 0 = Pull-up resistor in USB_D+ bus Disabled. 1 = Pull-up resistor in USB_D+ bus Active.
[7]	USBEN	USB Controller Enable Bit 0 = USB Controller Disabled. 1 = USB Controller Enabled.

[6]	Reserved	Reserved.
[5]	RWAKEUP	Remote Wake-up 0 = Release the USB bus from K state. 1 = Force USB bus to K (USB_D+ low, USB_D-: high) state, used for remote wake-up.
[4]	PHYEN	PHY Transceiver Function Enable Bit 0 = PHY transceiver function Disabled. 1 = PHY transceiver function Enabled.
[3]	TOUT	Time-out Status (Read Only) 0 = No time-out. 1 = No Bus response more than 18 bits time($\frac{1}{12MHz} \times 18 = 1.5\mu S$).
[2]	RESUME	Resume Status (Read Only) 0 = No bus resume. 1 = Resume from suspend.
[1]	SUSPEND	Suspend Status (Read Only) 0 = Bus no suspend. 1 = Bus idle more than 3ms, either cable is plugged out or host is sleeping.
[0]	USBRST	USB Reset Status (Read Only) 0 = Bus no reset. 1 = Bus reset when SE0 (single-ended 0) more than 2.5us.

For OUT token, write '1' to clear the OUT token had ready to receive the data from USB. This bit is write 1 only and is always 0 when it is read back.</p>

6.25 CRC Controller (CRC)

6.25.1 Overview

The Cyclic Redundancy Check (CRC) generator can perform CRC calculation with four common polynomials CRC-CCITT, CRC-8, CRC-16, and CRC-32 settings.

6.25.2 Features

- Supports four common polynomials CRC-CCITT, CRC-8, CRC-16, and CRC-32
 - CRC-CCITT: $X^{16} + X^{12} + X^5 + 1$
 - CRC-8: $X^8 + X^2 + X + 1$
 - CRC-16: $X^{16} + X^{15} + X^2 + 1$
 - CRC-32: $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$
- Programmable seed value
- Supports programmable order reverse setting for input data and CRC checksum
- Supports programmable 1's complement setting for input data and CRC checksum
- Supports 8/16/32-bit of data width
 - 8-bit write mode: 1-AHB clock cycle operation
 - 16-bit write mode: 2-AHB clock cycle operation
 - 32-bit write mode: 4-AHB clock cycle operation
- Supports using PDMA to write data to perform CRC operation

6.25.3 Block Diagram

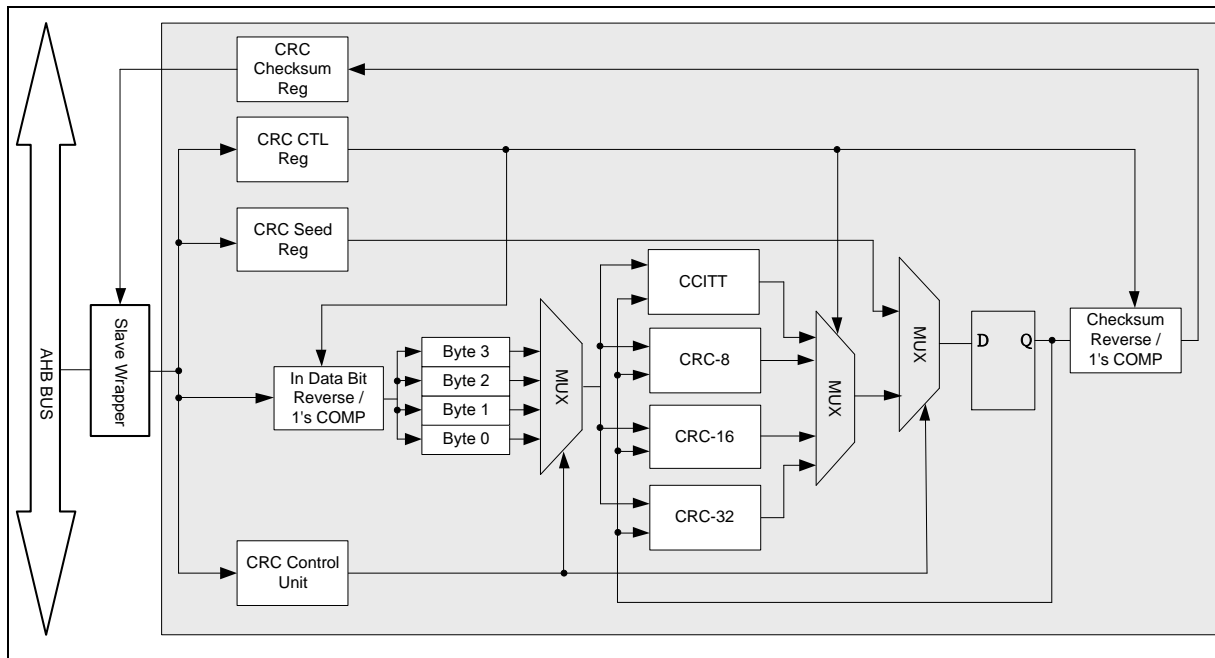

Figure 6.25-1 CRC Generator Block Diagram

6.25.4 Basic Configuration

- Clock Source Configuration
 - Enable CRC peripheral clock in CRCKEN (CLK_AHBCLK[7]).
- Reset Configuration
 - Reset CRC controller in CRCRST (SYS_IPRST0[7]).

6.25.5 Functional Description

CRC generator can perform CRC calculation with four common polynomial settings. The operation polynomial includes CRC-CCITT, CRC-8, CRC-16 and CRC-32; User can choose the CRC operation polynomial mode by setting CRCMODE[1:0] (CRC_CTL[31:30] CRC Polynomial Mode).

The following is a program sequence example.

1. Enable CRC generator by setting CRCEN (CRC_CTL[0] CRC Channel Enable Bit).
 - 1) Initial setting for CRC calculation.
2. Configure 1's complement for CRC checksum by setting CHKSFMT (CRC_CTL[27] Checksum 1's Complement).
 - 1) Configure bit order reverse for CRC checksum by setting CHKSREV (CRC_CTL[25] Checksum Bit Order Reverse). The functional block is also shown in Figure 6.25-2 CHECKSUM Bit Order Reverse Functional Block
 - 2) .
 - 3) Configure 1's complement for CRC write data by setting DATFMT (CRC_CTL[26] Write Data 1's Complement).
 - 4) Configure bit order reverse for CRC write data per byte by setting DATREV (CRC_CTL[24] Write Data Bit Order Reverse). The functional block is also shown in Figure 6.25-3.
3. Perform CHKSINIT (CRC_CTL[1] Checksum Initialization) to load the initial checksum value from CRC_SEED register value.
4. Write data to CRC_DAT register to calculate CRC checksum.
5. Get the CRC checksum result by reading CRC_CHECKSUM register.

6.26 Enhanced 12-bit Analog-to-Digital Converter (EADC)

6.26.1 Overview

The chip contains one 12-bit successive approximation analog-to-digital converter (SAR ADC converter) with 16 external input channels and 3 internal channels. The ADC converter can be started by software trigger, PWM0/1 triggers, BPWM0/1 triggers, Timer0~3 overflow pulse triggers, ADINT0, ADINT1 interrupt EOC (End of conversion) pulse trigger and external pin (EADC0_ST) input signal.

6.26.2 Features

- Analog input voltage range: $0 \sim V_{REF}$ (Max to AV_{DD})
- Reference voltage from V_{REF} pin or AV_{DD}
- 12-bit resolution and 10-bit accuracy is guaranteed
- Up to 16 single-end analog external input channels
- 3 internal channels, they are band-gap voltage (V_{BG}), temperature sensor (V_{TEMP}), and Battery power ($V_{BAT/4}$)
- Four EADC interrupts (ADINT0~3) with individual interrupt vector addresses
- Maximum EADC clock frequency is 16 MHz
- Up to 880 kSPS conversion rate
- Configurable EADC internal sampling time.
- Up to 19 sample modules:
 - Each of sample is configurable for EADC converter channel EADC_CH0~15 and trigger source
 - Sample module 16~18 is fixed for EADC channel 16, 17, 18 input sources as band-gap voltage, temperature sensor, and battery power ($V_{BAT/4}$)
 - Configurable sampling time for each sample module
 - Support left-adjusted result
 - 12-bit resolution for conversion result and 16-bit resolution for accumulated conversion result
 - Conversion results are held in 19 data registers with valid and overrun indicators
 - Averaging (2^n times, $n=0\sim8$) to support up to 12-bit result and over-sampling, or called Accumulation, (2^n times, $n=0\sim8$) to support up to 16-bit result
- An ADC conversion can be started by:
 - Write 1 to SWTRGn (EADC_SWTRG[n], $n = 0\sim18$)
 - External pin EADC0_ST
 - Timer0~3 overflow pulse triggers
 - ADINT0 and ADINT1 interrupt EOC (End of conversion) pulse triggers
 - PWM0/1 triggers
 - BPWM0/1 triggers
- Supports configurable PDMA transfer
- Auto turn on/off EADC power at power off or operation mode with wait state(10us stable time)

- Supports digital comparator to monitor conversion result and user can select whether to generate an interrupt when conversion result matches the compare register setting
- Internal reference voltage source: 1.536V, 2.048V, 2.560V, 3.072V, 4.096V and V_{REF} pin
- Supports offset cancellation

6.26.5 Functional Description

The EADC controller consists of a 19 channel analog switch, 19 sample modules and a 12-bit successive approximation analog-to-digital converter. The EADC operation is based on sample module 0~18, and each of them has its configuration to decide which trigger source to start the conversion, which channel to convert. Sample module 0~15 can be configured to EADC_CH0~15 channel and different trigger source. It provides user a flexible means to get the over-sampling results. The sample module 0~15 are shows as follows.

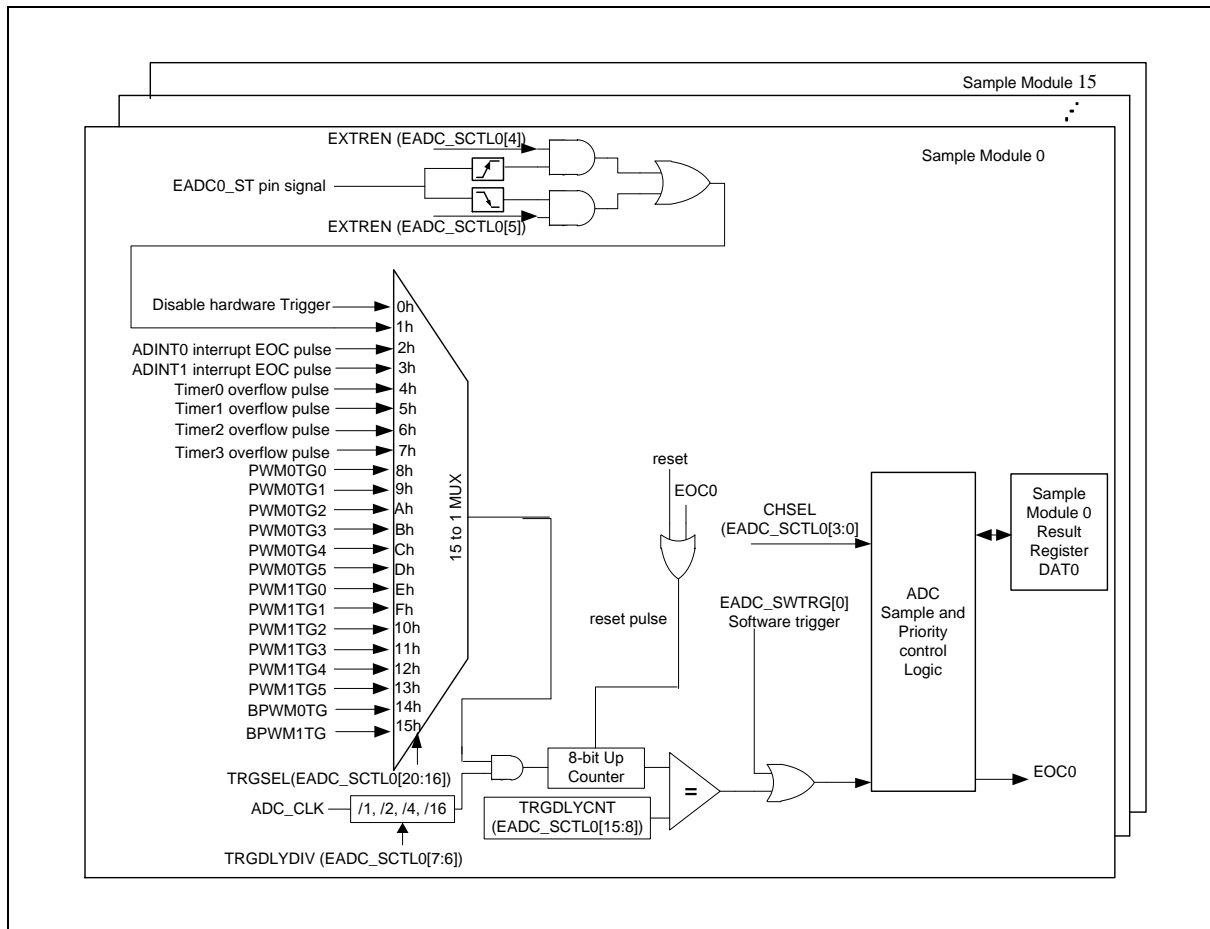

Figure 6.26-2 Sample Module 0~15 Block Diagram

Sample module 16~18 can convert internal channel (V_{BG} , V_{TEMP} , $V_{BAT}/4$) and can be triggered by user write SWTRGn (EADC_SWTRG[n], n = 16~18). Figure 6.26-3 shows the sample module 16~18.

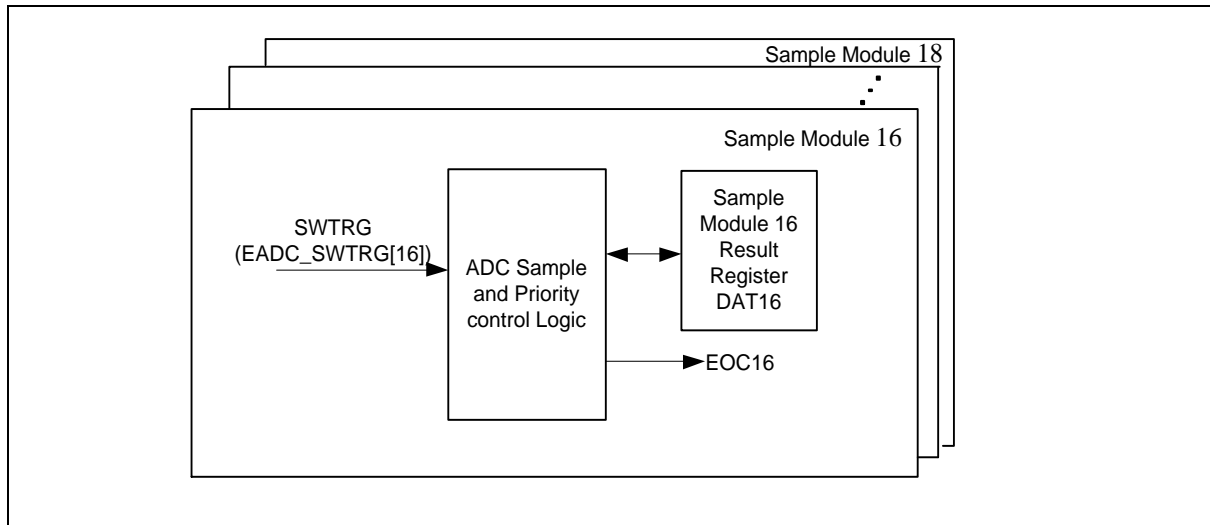

Figure 6.26-3 Sample Module 16~18 Block Diagram

The EADC conversion trigger sources in sample module 0~15 are listed below:

- Write 1 to SWTRGn (EADC_SWTRG[n], n = 0~15)
- External pin EADC0_ST
- Timer0~3 overflow pulse triggers
- ADINT0/1 EADC interrupt EOC (End of conversion) pulse triggers
- PWM0/1 triggers
- BPWM0/1 triggers

The ADINT0 or ADINT1 interrupt pulses are generated whenever the specific sample module ADC EOC (End of conversion) pulse is generated. ADINT0 or ADINT1 interrupt pulse triggers can be fed back to trigger another ADC conversion, and is useful if a continuous scan conversion is needed.

6.26.5.1 EADC Clock Generator

The maximum EADC clock frequency is up to 16 MHz and the maximum sampling rate is up to 880 kSPS. It needs 16 EADC clocks to complete an ADC conversion by default setting.

The clock control of EADC is shown as Figure 6.26-4. The EADC peripheral clock source is from PCLK1 clock, the EADC clock frequency is divided by an 8-bit pre-scaler with the following formula:

$$\text{EADC clock frequency} = (\text{PCLK1}) / (\text{EADCDIV} (\text{CLK_CLKDIV0}[23:16]) + 1)$$

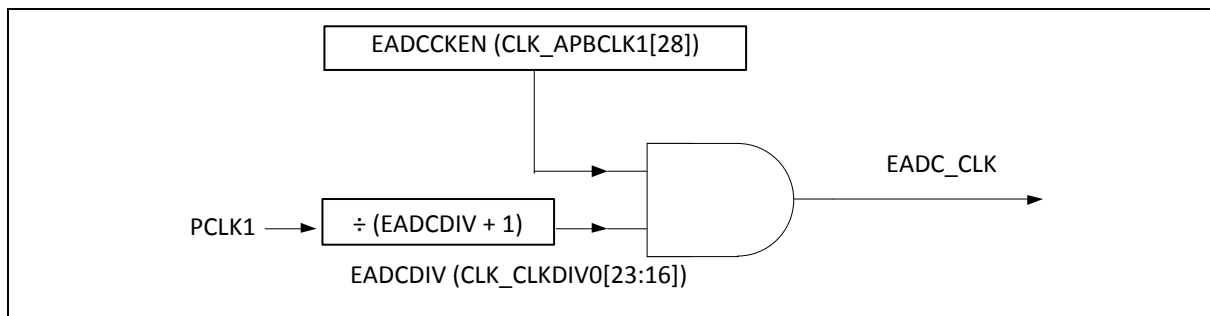

Figure 6.26-4 EADC Clock Control

6.26.5.2 EADC Software Trigger Mode

When a EADC conversion is performed on the sample module specified single channel, the operations are as follows:

1. ADC conversion is started when the SWTRGn (EADC_SWTRG[n], n=0~18) is set to 1 by user or other trigger inputs.
2. When ADC conversion is finished, the 12-bit result is stored in the EADC data register EADC_DATn (n=0~18) corresponding to the sample module.
3. Set SPLIE_n (EADC_INTSRC_m[n], n=0~18, m=0~3) to define which sample module affects ADIF_n (EADC_STATUS2[n], n=0~3) flag.
4. On completion of conversion, the ADIF_n (EADC_STATUS2[3:0], n=0~3) is set to 1 and EADC interrupt (ADINT_n, n=0~3) is requested if the EADCIEN_n (EADC_CTL[5:2], n=0~3) bit is set to 1.
5. The SWTRG_n (n=0~18) bit remains 1 during ADC conversion. When ADC conversion ends, the SWTRG_n (n=0~18) bit is automatically cleared to 0 and the ADC converter will do another pending conversion.

The timing diagram of a conversion cycle is shown in Figure 6.26-5.

Figure 6.26-5 Example EADC Conversion Timing Diagram, n=0~18

If more than one sample module is enabled to convert analog signal, the sample module specified channel with highest priority is firstly converted and other enabled sample module will be pended. The lower number sample module has higher priority. The sample module 0 is highest priority and the sample module 18 is lowest priority.

6.26.5.3 EADC Conversion Priority

There is a priority group converter for determining the conversion order when multiple sample module trigger flags are set at the same time, if two sample module are triggered at the same time, the sample module with lower number will start to convert EADC first.

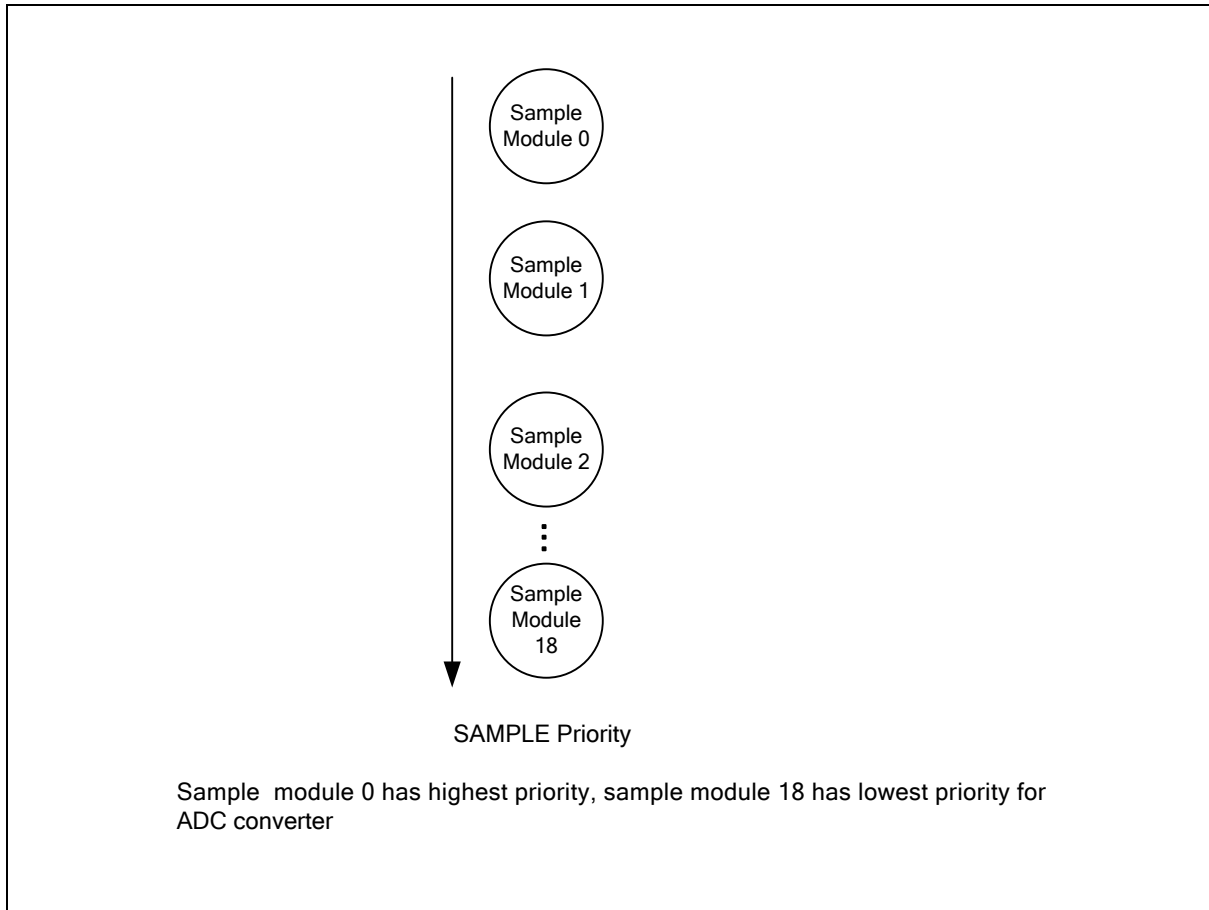

Figure 6.26-6 Sample Module Conversion Priority Arbitrator Diagram

6.26.5.4 EADC Sample Module End of Conversion (EOC) Interrupt Operation

There are 4 EADC interrupts ADINT0~3, and each of these interrupts has its own interrupt vector address and ADINT0/ADINT1 can be configured to set multiple sample module EOC pulse (sample module 0~18 End of conversion pulses) as its interrupt trigger source.

When EADCIEN0 (EADC_CTL[2]) = 1 and SPLIE_n (EADC_INTSRC0[n],n=0~18) = 1, all sample module EOC (End of conversion) pulses can cause an ADINT0 interrupt.

The ADINT0, ADINT1 interrupt pulses are generated whenever the specific sample module ADC EOC pulse is generated. The ADINT0, ADINT1 interrupt pulses can also be the sample module conversion trigger sources. The ADINT0, ADINT1 interrupt pulses can be used to do the EADC continuous scan conversion.

The example of continuous scan triggered by interrupt is as follows:

1. If EADC sample module 2 EOC2 pulse is selected as ADINT0 interrupt trigger SPLIE₂ (EADC_INTSRC0[2]) = 1 and ADINT0 is selected as sample module 0, 1, 2 hardware conversion trigger.
2. Set software trigger SWTRG2 (EADC_SWTRG[2]) to 1 to start a sample module 2 conversion an EOC2 pulse signal. The EOC2 pulse signal is served as ADINT0 interrupt pulse at end of sample module 2 EADC conversion. ADINT0 interrupt pulse will trigger the sample module 0, 1, 2 to start the EADC conversions.
3. ADINT0 interrupt pulse repeats to trigger sample module 0, 1, 2 EADC conversions automatically.

4. Clear TRGSEL (EADC_SCTL2[20:16]) to 0 to disable sample module 2 ADINT0 interrupt pulse hardware trigger, if needs to stop the continuous scan.

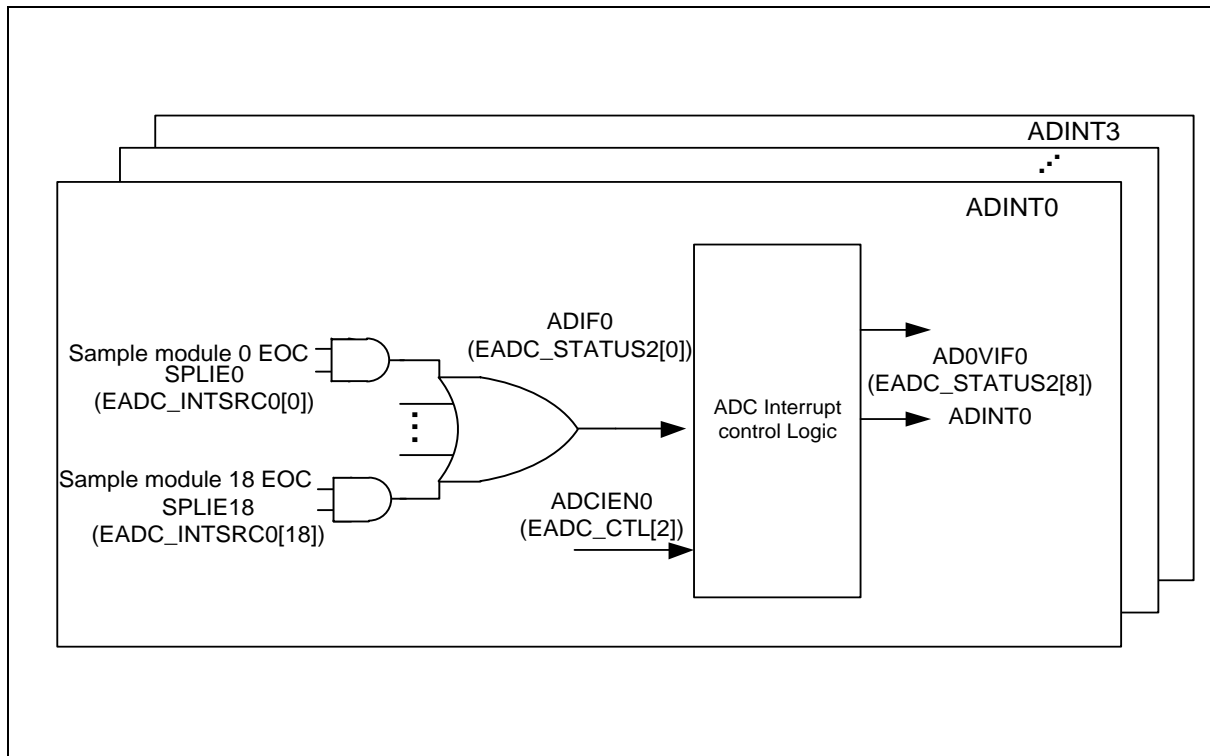

Figure 6.26-7 Specific Sample Module ADC EOC Signal for ADINT0~3 Interrupt

6.26.5.5 EADC Trigger by External Pin EADC0_ST

ADC conversion can be triggered by external pin EADC0_ST request. Setting the TRGSEL (EADC_SCTLn[20:16], n=0~15) to 0x01 is to select external trigger input from the EADC0_ST pin. User can set EXTFEN (EADC_SCTLn[5], n=0~15) and EXTREN (EADC_SCTLn[4], n=0~18) to enable pin EADC0_ST trigger condition is falling or rising edge. There is a de-bounce circuit to detect falling or rising edge. If rising edge trigger condition is selected, the low state must be kept at least 2 PCLK cycles and the following high state must be kept at least 3 PCLK cycles. If falling edge trigger condition is selected, the high state must be kept at least 2 PCLK cycles and the following low state must be kept at least 3 PCLK cycles. Pulse that is shorter than this specification will be ignored. The external trigger timing is shown in Figure 6.26-8.

6.26.5.6 EADC Trigger by Timer Trigger

There are 4 Timer trigger sources, The TRGSEL (EADC_SCTLn[20:16], n=0~15) bits is used to select external hardware trigger input source from Timer trigger. The detail trigger conditions of Timer are described at TIMER0_TRGCTL ~ TIMER3_TRGCTL register

6.26.5.7 EADC Trigger by PWM Trigger

There are 12 PWM trigger sources (rising, falling PWM edge or center point of PWM).

The TRGSEL (EADC_SCTLn[20:16], n=0~15) bits is used to select external hardware trigger input source from PWM trigger. The detail trigger conditions of PWM are described at PWM_EADCTS0 and PWM_EADCTS1 register

6.26.5.8 EADC Trigger by BPWM Trigger

There are 2 BPWM trigger sources which can be selected to configure sample module 0~15 for EADC start trigger. The TRGSEL (EADC_SCTLn[20:16], n=0~15) bits is used to select external hardware

trigger input source from BPWM trigger. The detail trigger conditions of BPWM are described at BPWM_EADCTS0 and BPWM_EADCTS1 register.

Figure 6.26-8 EADC0_ST De-bounce Timing Diagram

6.26.5.9 EADC Trigger Delay

The device also allows user to configure the amount of delay period to EADC start after hardware detected the external trigger. User can configure the trigger delay time by setting TRGDLYCNT (EADC_SCTLn[15:8], n=0~15) and TRGDLYDIV (EADC_SCTLn[7:6], n=0~15). Figure 6.26-9 shows the programmable delay time for PWM-triggered EADC start conversion.

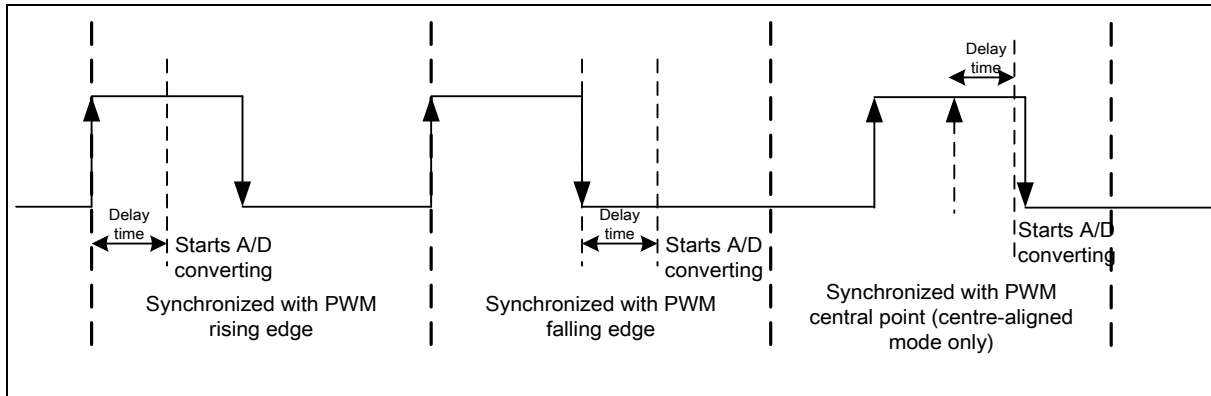

Figure 6.26-9 PWM-triggered EADC Start Conversion

Figure 6.26-10 shows the programmable delay time for other trigger source.

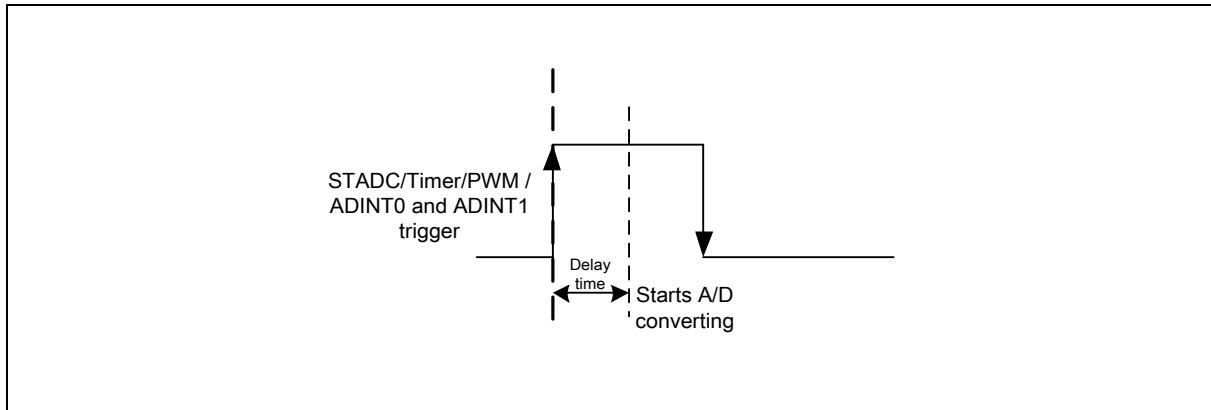

Figure 6.26-10 External triggered EADC Start Conversion

6.26.5.10 Input Sampling and ADC Conversion Time

The ADC converter sample the analog input when ADC conversion start delay time (T_d) has passed after $SWTRG_n$ ($EADC_SWTRG[n]$, $n=0\sim 18$) is set to 1, then start conversion. Due to EADC clock is generated by PCLK divided by $(EADC_{DIV}(CLK_CLKDIV0 [23:16])+1)$, the maximum delay time from user write $SWTRG_n$ to ADC start sampling analog input time is two EADC clock cycles. The start delay time is shown in Figure 6.26-11.

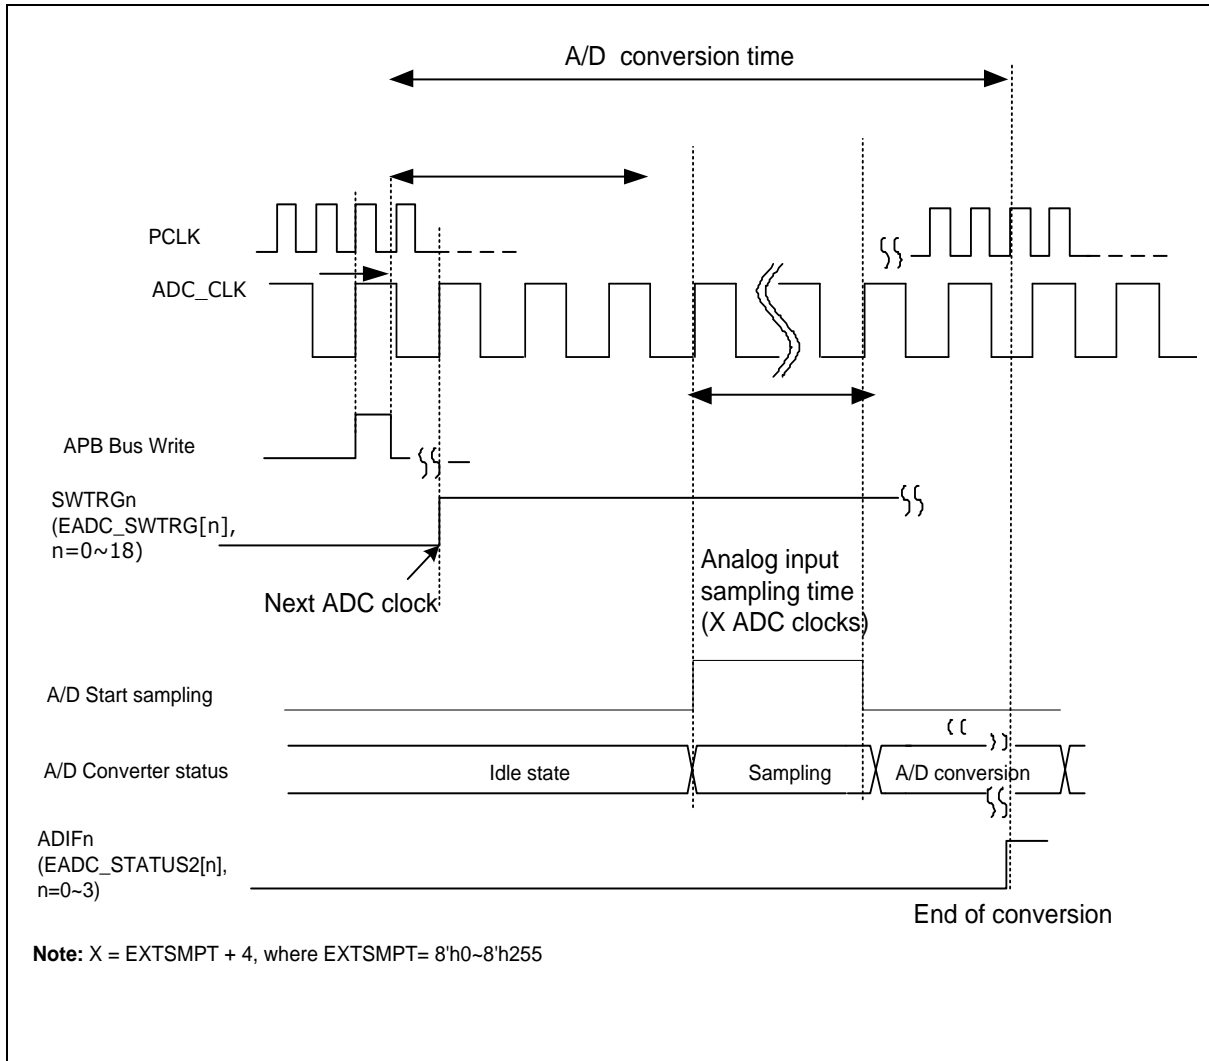

Figure 6.26-11 Conversion Start Delay Timing Diagram

6.26.5.11 ADC Extend Sampling Time

When ADC operates at high EADC clock rate, the sampling time of analog input voltage may not be enough if the analog channel has heavy loading to cause fully charge time is longer. User can set extend sampling time by writing EXTSMPT (EADC_SCTLn[31:24], n=0~15) for each sample module. The ADC extend sampling time is present between ADC controller judging which channel to be converted and ADC starting conversion. The range of extend sampling time is from 0 ~255 EADC clock. The extended sampling time is shown in Figure 6.26-12.

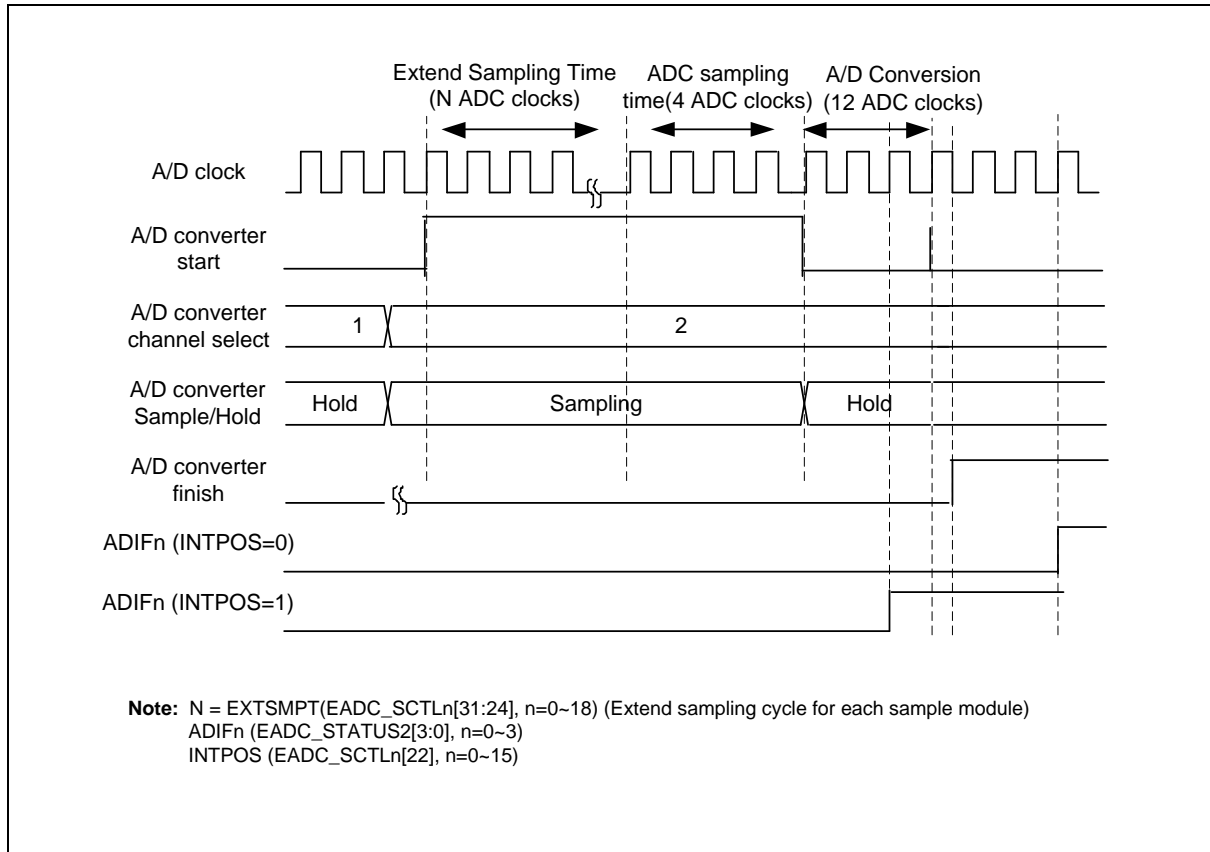

Figure 6.26-12 ADC Extend Sampling Timing Diagram

6.26.5.12 EADC conversion Result Format

At the end of each conversion (when an EOC event occurs), the result of the converted data is stored in the EADC_DATn data register which is 16-bit wide. The format of the EADC_DATn depends on the configured data alignment and resolution. The ALIGN (EADC_MnCTL1[0]) bit selects the alignment of the conversion result. Data can be right-aligned (ALIGN=0) or left-aligned (ALIGN=1) as shown in Figure 6.26-13. It is noted that n = 0~15.

- 12-bit left alignment: EADC conversion result is stored in EADC_DATn[15:4] bits. EADC_DATn[31:16] and EADC_DATn[3:0] are ignored in EADC conversion.
- 12-bit right alignment: EADC conversion result is stored in EADC_DATn[11:0] bits, EADC_DATn[31:12] are ignored in AC conversion. It is noted that n = 0~15.

Figure 6.26-13 EADC_DATn (n= 0~15) Aligned Format

6.26.5.13 Accumulation

The function provides multiple consecutive conversion results to be accumulated to a final conversion result. Setting ACU (EADC_MnCTL1[7:4], n=0~15) determine which sample module and the number of

samples to be accumulated. It is noted that when more than 16 samples to be accumulated, the final result after accumulating will exceed the 16-bit RESULT(EADC_DATn [0:15], n=0~18) register size. In this case, the result is right shifted automatically to fit within the appropriate register size. It is noted that accumulation function is only effective without data left alignment.

ACU (EADC_MnCTL1 [7:4]), N=0~15	Number Of Samples To Be Accumulated	Right Shift Division Factor	Final Result Precision
0x0	1	1	12 bits
0x1	2	1	13 bits
0x2	4	1	14 bits
0x3	8	1	15 bits
0x4	16	1	16 bits
0x5	32	2	16 bits
0x6	64	4	16 bits
0x7	128	8	16 bits
0x8	256	16	16 bits

Table 6.26-2 The Setting of Accumulation and Conversion Result Precision

The result from multiple consecutive conversions can be accumulated. The number of samples can be accumulated is specified by ACU (EADC_MnCTL1[7:4], n=0~15). When accumulating more than 16 samples, the result will be too large to match the 16-bit RESULT(EADC_DATn [0:15], n=0~18) register size. To avoid overflow, the result is right shifted automatically to fit within the available register size. It is noted that accumulation is only effective without data left alignment.

AVG EADC_MnCTL1 [1]	ACU EADC_MnCTL1 [7:4]	Number Accumulated Samples	Of	Automatic Division Factor	Final Precision	Result
0x0	0x0	1		1	12 bits	
0x0	0x1	2		1	13 bits	
0x0	0x2	4		1	14 bits	
0x0	0x3	8		1	15 bits	
0x0	0x4	16		1	16 bits	
0x0	0x5	32		2	16 bits	
0x0	0x6	64		4	16 bits	
0x0	0x7	128		8	16 bits	
0x0	0x8	256		16	16 bits	

Table 6.26-3 The Setting of Accumulation and Conversion Result Precision

6.26.5.14 Averaging

The function increasing the sample accuracy with reduced sampling rate and the feature is suitable in noisy operating environment for getting more stable average conversion results. According to the accumulated final result in 6.26.5.13, setting AVG (EADC_MnCTL1[1]) can enable averaging function as shown in Table 6.26-5. The automatic division factor is decided by the number of accumulated samples and the final result will get 12 bits precision. It is noted that averaging is only effective when accumulating two more samples without data left alignment.

AVG EADC_MnCTL1 [1]	ACU EADC_MnCTL1 [7:4]	Number Of Samples To Be Accumulated	Automatic Factor	Division	Final Precision	Result
0x1	0x0	1	1		12 bits	
0x1	0x1	2	2		12 bits	
0x1	0x2	4	4		12 bits	
0x1	0x3	8	8		12 bits	
0x1	0x4	16	16		12 bits	
0x1	0x5	32	32		12 bits	
0x1	0x6	64	64		12 bits	
0x1	0x7	128	128		12 bits	
0x1	0x8	256	256		12 bits	

Table 6.26-4 The Setting of Averaging and Conversion Result Precision

Averaging is a feature that increases the sample accuracy at the cost of a reduced sampling rate. This feature is suitable when operating in noisy conditions. Averaging is done by accumulating m samples, as described in section 6.26.5.13, and dividing the result by m. The averaged result is available in the data register. The number of samples to be accumulated is specified by writing to ACU (EADC_MnCTL1[7:4], n=0~15) as shown in Table 6.26-3. Setting AVG (EADC_MnCTL1[1]) can enable averaging function as shown in Table 6.26-5. The division is obtained by a combination of the automatic right shift described above. It is noted that averaging is only effective when accumulating two more samples without data left alignment.

AVG EADC_MnCTL1 [1]	ACU EADC_MnCTL1 [7:4]	Number Accumulated Samples	Of	Automatic Factor	Division	Final Precision	Result
0x1	0x0	1		1		12 bits	
0x1	0x1	2		2		12 bits	
0x1	0x2	4		4		12 bits	
0x1	0x3	8		8		12 bits	
0x1	0x4	16		16		12 bits	
0x1	0x5	32		32		12 bits	

0x1	0x6	64	64	12 bits
0x1	0x7	128	128	12 bits
0x1	0x8	256	256	12 bits

Table 6.26-5 The Setting of Averaging and Conversion Result Precision

6.26.5.15 Conversion Result Monitor by Compare Mode

The EADC controller provides four sets of compare registers EADC_CMP0 ~ EADC_CMP3 to monitor a maximum of four specified sample module 0~18 conversion results from ADC conversion module, as shown in Figure 6.26-14. User can select which sample module result to be monitored by set CMPSPN (EADC_CMPn[7:3], n =0~3) and CMPCOND (EADC_CMPn[2], where n =0~3) is used to check conversion result is less than specify value or greater than (equal to) value specified in CMPDAT (EADC_CMPn[27:16], where n =0~3). When the conversion of the sample module specified by CMPSPN is completed, the comparing action will be triggered one time automatically. When the compare result meets the compare condition, the internal compare match counter will increase 1. If the compare result does not meet the condition, the compare match counter will reset to 0. When counter value reach the setting of (CMPMCNT (EADC_CMPn[11:8])+1, where n =0~3) then EADCMPIE (EADC_STATUS2[7:4], where n =0~3) bit will be set to 1, if EADCMPIE (EADC_CMPn[1], n =0~3) is set then an ADINT3 interrupt request is generated. User can use it to monitor the external analog input pin voltage transition. Detailed logics diagram is shown in Figure 6.26-14.

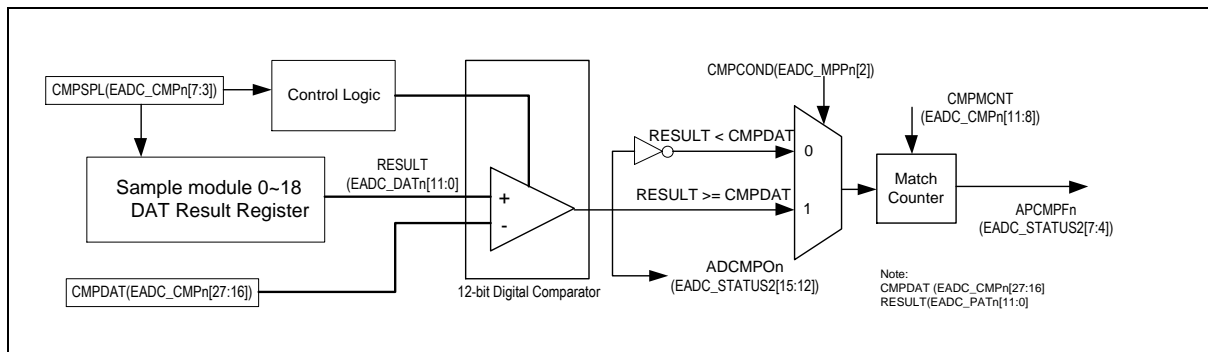

Figure 6.26-14 ADC Conversion Result Monitor Logics Diagram

The EADC controller supports a window compare mode. User can set CMPWEN (EADC_CMP0[15]/EADC_CMP2[15]) to enable this function. If user enables this function, EADCMPIE0 (EADC_STATUS2[4]) will be set when both EADC_CMP0 and EADC_CMP1 compared condition matched. EADCMPIE2 (EADC_STATUS2[6]) will be set when both EADC_CMP2 and EADC_CMP3 compared condition matched.

6.26.5.16 Auto Power On/Off Mode

The EADC has an automatic power management feature called auto power on-off mode. Setting AUTOFF (EADC_PWRCTL[5]) to 1 can enable this function. AUTOFF needs combine with AUTOPDTH (EADC_PWRCTL[23:20]) to work. When a Sample Module is finished, EADC will enter idle state. If AUTOFF (EADC_PWRCTL[5]) is set to 1 and the interval of time in idle state is longer than AUTOPDTH, EADC will power-down ADC converter analog circuit to reduce power consumption. The EADCEN (EADC_CTL[0]) will be set to 0 when EADC power-down and set to 1 when EADC be wake-up.

The EADC will automatically wake up when a conversion is started (by software or hardware trigger). A start-up time is automatically inserted between the trigger event which starts the conversion and the sampling time of the EADC. The start-up time must be longer than 10 us that can be set by STUPT (EADC_PWRCTL[19:8]).

6.26.5.17 PDMA Request

The EADC controller supports configurable PDMA. User can config source address of PDMA channels as EADC_CURDAT (EADC_BA+0x4C) and enable PDMATEN (EADC_PDMACTL[18:0]) to decide which channel should be performed PDMA transfer. After enable PDMATEN, if any VALID (EADC_DATn[17],n=0~18) is high, EADC controller will send request to PDMA and PDMA will read EADC_CURDAT to get result. The EADC_CURDAT register is a shadow register of highest priority EADC_DAT register. The lower number sample module is higher priority. After PDMA read EADC_CURDAT register, the VAILD of the shadow EADC_DAT register will be automatically cleared.

6.26.5.18 Interrupt Sources

The ADC converter generates ADIFn (EADC_STATUS2[3:0], n=0~3) at the start of conversion or the end of conversion decide by INTPOS (EADC_SCTLn[22], n=0~15). If EADCIENn (EADC_CTL[5:2], n=0~3) is set then conversion end interrupt request ADINTn (n=0~3) is generated. The controller of interrupts is shown as Figure 6.26-15.

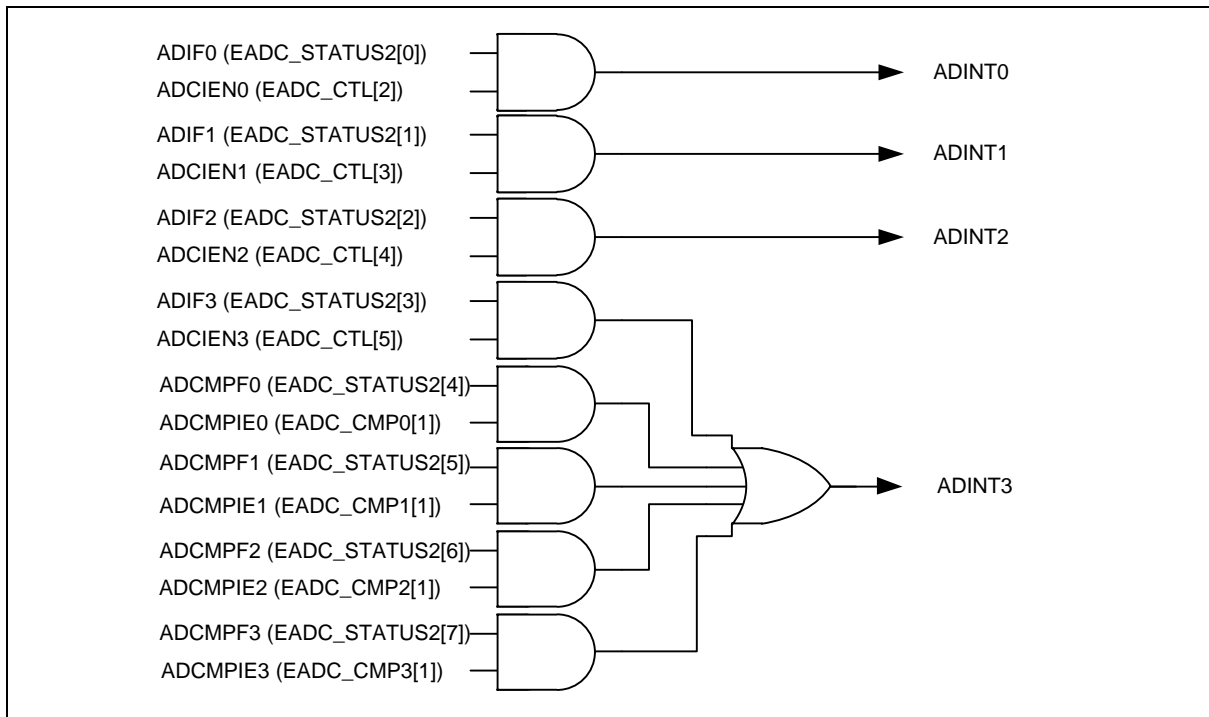

Figure 6.26-15 ADC Controller Interrupts

6.26.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

Bits	Description	
[31:28]	Reserved	Reserved.
[27:16]	CMPDAT	Comparison Data The 12 bits data is used to compare with conversion result of specified sample module. User can use it to monitor the external analog input pin voltage transition without imposing a load on software.
[15]	CMPWEN	Compare Window Mode Enable Bit 0 = EADCMPF0 (EADC_STATUS2[4]) will be set when EADC_CMP0 compared condition matched. EADCMPF2 (EADC_STATUS2[6]) will be set when EADC_CMP2 compared condition matched 1 = EADCMPF0 (EADC_STATUS2[4]) will be set when both EADC_CMP0 and EADC_CMP1 compared condition matched. EADCMPF2 (EADC_STATUS2[6]) will be set when both EADC_CMP2 and EADC_CMP3 compared condition matched. Note: This bit is only present in EADC_CMP0 and EADC_CMP2 register.
[14:12]	Reserved	Reserved.
[11:8]	CMPMCNT	Compare Match Count When the specified ADC sample module analog conversion result matches the compare condition defined by CMPCOND (EADC_CMPn[2], n=0~3), the internal match counter will increase 1. If the compare result does not meet the compare condition, the internal compare match counter will reset to 0. When the internal counter reaches the value to (CMPMCNT +1), the EADCMPFn (EADC_STATUS2[7:4], n=0~3) will be set.

Bits	Description	
[7:3]	CMPSPL	<p>Compare Sample Module Selection</p> <p>00000 = Sample Module 0 conversion result EADC_DAT0 is selected to be compared. 00001 = Sample Module 1 conversion result EADC_DAT1 is selected to be compared. 00010 = Sample Module 2 conversion result EADC_DAT2 is selected to be compared. 00011 = Sample Module 3 conversion result EADC_DAT3 is selected to be compared. 00100 = Sample Module 4 conversion result EADC_DAT4 is selected to be compared. 00101 = Sample Module 5 conversion result EADC_DAT5 is selected to be compared. 00110 = Sample Module 6 conversion result EADC_DAT6 is selected to be compared. 00111 = Sample Module 7 conversion result EADC_DAT7 is selected to be compared. 01000 = Sample Module 8 conversion result EADC_DAT8 is selected to be compared. 01001 = Sample Module 9 conversion result EADC_DAT9 is selected to be compared. 01010 = Sample Module 10 conversion result EADC_DAT10 is selected to be compared. 01011 = Sample Module 11 conversion result EADC_DAT11 is selected to be compared. 01100 = Sample Module 12 conversion result EADC_DAT12 is selected to be compared. 01101 = Sample Module 13 conversion result EADC_DAT13 is selected to be compared. 01110 = Sample Module 14 conversion result EADC_DAT14 is selected to be compared. 01111 = Sample Module 15 conversion result EADC_DAT15 is selected to be compared. 10000 = Sample Module 16 conversion result EADC_DAT16 is selected to be compared. 10001 = Sample Module 17 conversion result EADC_DAT17 is selected to be compared. 10010 = Sample Module 18 conversion result EADC_DAT18 is selected to be compared.</p>
[2]	CMPCOND	<p>Compare Condition</p> <p>0= Set the compare condition as that when a 12-bit ADC conversion result is less than the 12-bit CMPDAT (EADC_CMPn [27:16]), the internal match counter will increase one. 1= Set the compare condition as that when a 12-bit ADC conversion result is greater or equal to the 12-bit CMPDAT (EADC_CMPn [27:16]), the internal match counter will increase one.</p> <p>Note: When the internal counter reaches the value to (CMPMCNT (EADC_CMPn[11:8], n=0~3) +1), the EADCMPFn bit will be set.</p>
[1]	EADCMPIE	<p>ADC Result Compare Interrupt Enable Bit</p> <p>0 = Compare function interrupt Disabled. 1 = Compare function interrupt Enabled.</p> <p>If the compare function is enabled and the compare condition matches the setting of CMPCOND (EADC_CMPn[2], n=0~3) and CMPMCNT (EADC_CMPn[11:8], n=0~3), EADCMPFn (EADC_STATUS2[7:4], n=0~3) will be asserted, in the meanwhile, if EADCMPIE is set to 1, a compare interrupt request is generated.</p>
[0]	EADCMPEN	<p>ADC Result Compare Enable Bit</p> <p>0 = Compare Disabled. 1 = Compare Enabled.</p> <p>Set this bit to 1 to enable compare CMPDAT (EADC_CMPn[27:16], n=0~3) with specified sample module conversion result when converted data is loaded into EADC_DAT register.</p>

6.27 Digital to Analog Converter (DAC)

6.27.1 Overview

The DAC module is a 12-bit, voltage output digital-to-analog converter. It can be configured to 12-or 8-bit output mode and can be used in conjunction with the PDMA controller. The DAC integrates a voltage output buffer that can be used to reduce output impedance and drive external loads directly without having to add an external operational amplifier.

6.27.2 Features

- Analog output voltage range: 0~AV_{DD}.
- Supports 12-or 8-bit output mode.
- Rail to rail settle time 6us.
- Supports up to one 12-bit 1 MSPS voltage type DAC.
- Reference voltage from internal reference voltage (INT_VREF), V_{REF} pin.
- DAC maximum conversion updating rate 1 MSPS.
- Supports voltage output buffer mode and bypass voltage output buffer mode.
- Supports software and hardware trigger, including Timer0~3 and external trigger pin to start DAC conversion.
- Supports PDMA mode.

6.27.5 Functional Description

6.27.5.1 DAC Output

The DAC is a 12-bit voltage output digital-to-analog converter and can be configured as 12-or 8-bit operation mode. The DAC integrates a voltage output buffer that can be used to reduce output impedance and drive external loads directly without having to add an external operational amplifier. The DAC channel output buffer can be enabled and disabled by BYPASS (DAC0_CTL[8]). The maximum DAC output voltage is limited to the selected reference voltage source.

6.27.5.2 DAC Reference Voltage

The DAC reference voltage is shared with EADC reference voltage and it is configured by VREFCTL (SYS_VREFCTL[4:0]) in system manager control registers. The reference voltage for the DAC can be configured from external reference voltage pin (V_{REF}) or internal reference voltage generator (INT_VREF) or analog power pin (AV_{DD}).

6.27.5.3 DAC Data Format

The DAC supports conversion data left alignment or right alignment mode. Depending on the selected configuration mode, the data needs to be written into the specified register as follows:

- 12-bit left alignment: user has to load data into DAC0_DAT[15:4] bits. DAC0_DAT[31:16] and DAC0_DAT[3:0] are ignored in DAC conversion.
- 12-bit right alignment: user has to load data into DAC0_DAT[11:0] bits, DAC0_DAT[31:12] are ignored in DAC conversion.

While DAC is working in 8-bit mode, alignment setting has no effect. To enable 8-bit mode, set BWSEL(DAC0_CTL[15:14]) to 01. Otherwise keep BWSEL as 00.

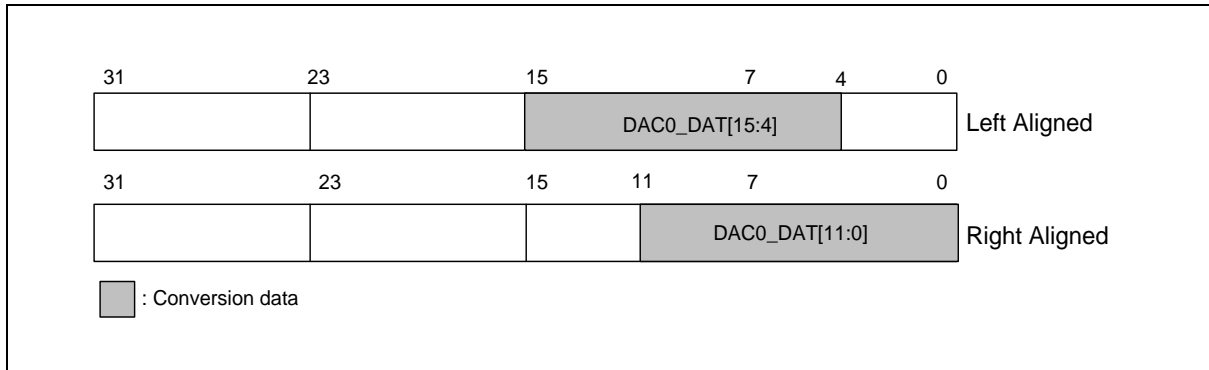

Figure 6.27-212-bit Data Holding Register Format

Figure 6.27-38-bit Mode Data Holding Register Format

Figure 6.27-4 Data Output Register Format

6.27.5.4 DAC Conversion

Any data transfer to the DAC channel is performed by loading the data into DAC0_DAT register. Figure 6.27-5 shows the DAC conversion started by software write operation. When user writes the conversion data to data holding register DAC0_DAT, the data is loaded into data output register DAC0_DATOUT by hardware and DAC starts data conversion after one PCLK (APB clock) clock cycle. Figure 6.27-6 shows the DAC conversion started by hardware trigger (external pin DAC0_ST, timer trigger event). The data stored in the DAC0_DAT register is automatically transferred to the data output buffer DAC0_DATOUT after occurring one PCLK (APB clock) the event.

When DAC data output register DAC0_DATOUT is loaded with the DAC0_DAT contents, the analog output voltage becomes available after specified conversion settling time. The conversion settling time is 6us when 12-bit input code transition from lowest code (0x000) to highest code (0xFFFF). Two adjacent codes conversion settling time is 1us. The DAC controller provides a 10-bit time counter for user to count the conversion time period. In continuous conversion operation, user needs to write appropriate value to SETTLET (DAC0_TCTL[9:0]) to define DAC conversion time period. The value must be longer than DAC conversion settling time which is specified in DAC electric characteristic table. For example, when DAC controller APB clock speed is 50 MHz and DAC conversion settling time is 6us, the selected SETTLET value must be greater than 0x12C. When the conversion is started, the conversion finish flag FINISH (DAC0_STATUS[0]) is cleared to 0 by hardware and set to 1 after the time counter counts to

SETTLET.

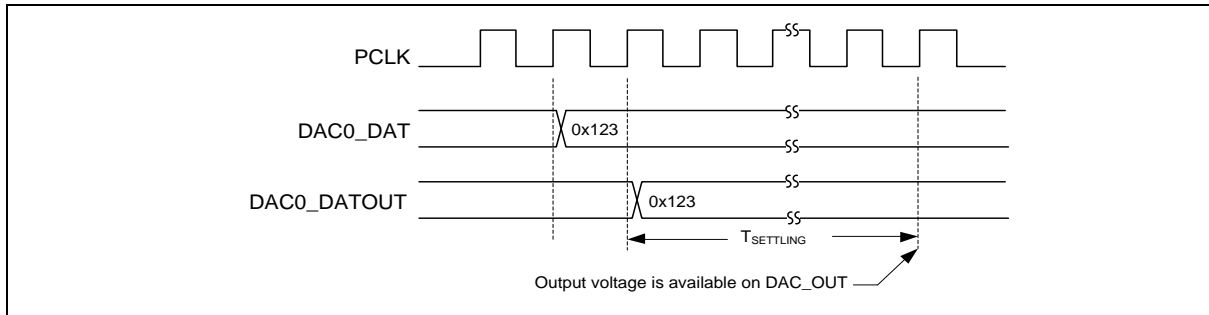

Figure 6.27-5 DAC Conversion Started by Software Write Trigger

6.27.5.5 DAC Output Voltage

Digital inputs are converted to output voltage on a linear conversion between 0 and reference voltage V_{REF} . The analog output voltage on DAC pin is determined by the following equation:

$$DACOUT = V_{REF} * \frac{DAT0OUT[11:0]}{4096}$$

6.27.5.6 DAC Trigger Selection

The DAC conversion can be started by writing DAC0_DAT, software trigger or hardware trigger. When TRGEN (DAC0_CTL[4]) is 0, the data conversion is started by writing DAC0_DAT register. When TRGEN (DAC0_CTL[4]) is 1, the data conversion is started by external DAC0_ST pin, timer event. If the software trigger is selected, the conversion starts once the SWTRG (DAC0_SWTRG[0]) is set to 1. The SWTRG is cleared to 0 by hardware automatically when DAC0_DATOUT has been loaded with DACDAT content. The TRGSEL (DAC0_CTL[7:5]) determines which one of six events is selected to start the conversion.

When DAC detects a rising edge on the selected trigger event input, the last data stored in DACDAT is transferred into the DAC0_DATOUT[11:0] and DAC starts converting after one PCLK (APB clock) clock cycle.

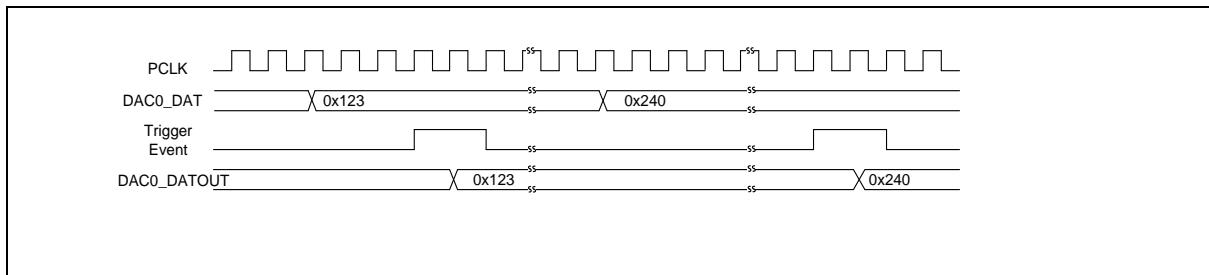

Figure 6.27-6 DAC Conversion Started by Hardware Trigger Event

6.27.5.7 DMA Operation

A DAC DMA request is generated when a hardware trigger event occurs while DMAEN (DAC0_CTL[2]) is set. The content of DAC0_DAT is transferred to the DAC0_DATOUT[11:0] and DAC starts data conversion after one PCLK (APB clock) clock cycle. The new transferred data by PDMA in DAC0_DAT will be converted when next trigger event arrives. Figure 6.27-7 shows the DAC PDMA under-run condition, when the second DMA request trigger event arrives before the first conversion finish, then no new PDMA request is issued and DMA under-run flag DMAUDR (DAC0_STATUS[1]) is set 1 to report the error condition. DMA data transfers are then disabled and no further DMA request is treated and DAC continues to convert last data. An interrupt is also generated if the corresponding DMAURIEN

(DAC0_CTL[3]) is enabled. User has to change the trigger event frequency in timer and then start DAC conversion again.

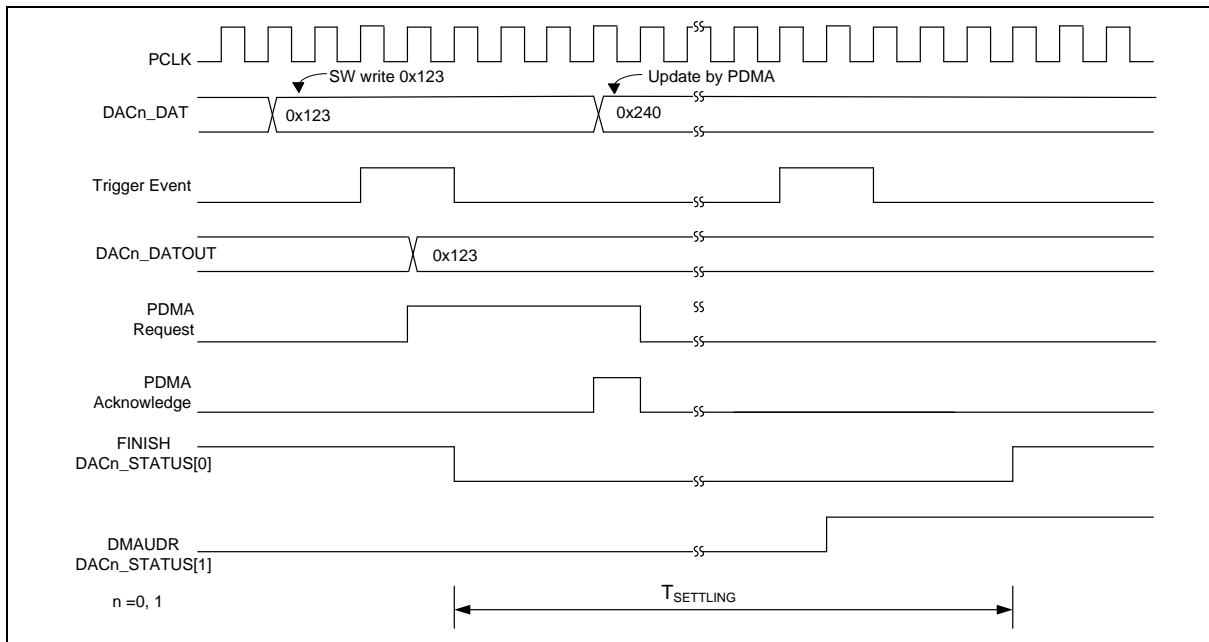

Figure 6.27-7 DAC PDMA Under-Run Condition Example

The DMA request can also be generated by software enable, user sets DMAEN (DAC0_CTL[2]) to 1 and TRGEN (DAC0_CTL[4]) to 0, DMA request is generated periodically according to the conversion time defined by SETTLET (DAC0_TCTL[9:0]) value. DAC output is updated periodically. When user clears DMAEN (DAC0_CTL[2]) to 0, DAC controller will stop issuing next new PDMA transfer request.

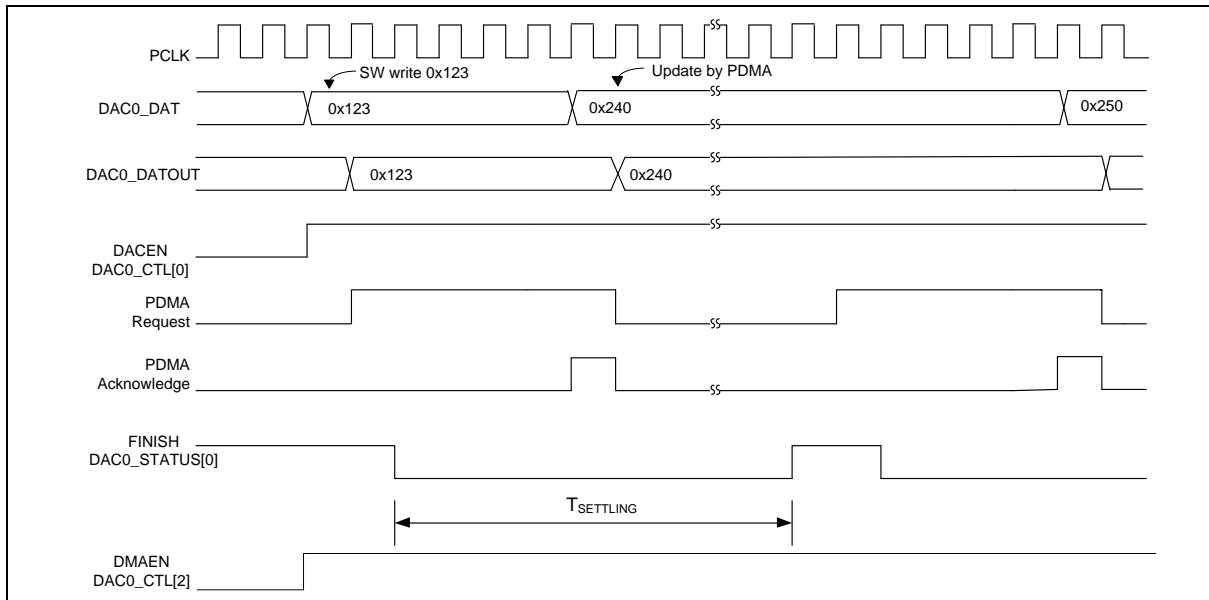

Figure 6.27-8 DAC Continuous Conversion with Software PDMA Mode

6.27.5.8 Interrupt Sources

There are two interrupt sources in the DAC controller, one is DAC data conversion finish interrupt and the other is DMA under-run interrupt. When DAC conversion is finished, the FINISH (DAC0_STATUS[0])

is set to 1 and an interrupt occurs while DACIEN (DAC0_CTL[1]) is enabled. If new DMA trigger event occurs during DAC data conversion period, the DMA under-run flag DMAUDR (DAC0_STATUS[1]) is generated and an interrupt occurs if DMAURIEN (DAC0_CTL[3]) is enabled.

6.28 Analog Comparator Controller (ACMP)

6.28.1 Overview

The chip provides two comparators. The comparator output is logic 1 when positive input is greater than negative input; otherwise, the output is 0. Each comparator can be configured to generate an interrupt when the comparator output value changes.

6.28.2 Features

- Analog input voltage range: 0 ~ AV_{DD}
- Up to two rail-to-rail analog comparators
- Supports hysteresis function
 - Supports programmable hysteresis window: 0mV, 10mV, 20mV and 30mV
- Supports wake-up function
- Supports programmable propagation speed and low power consumption
- Selectable input sources of positive input and negative input
- ACMP0 supports:
 - 4 multiplexed I/O pins at positive sources:
 - ◆ ACMP0_P0, ACMP0_P1, ACMP0_P2, or ACMP0_P3
 - 4 negative sources:
 - ◆ ACMP0_N
 - ◆ Comparator Reference Voltage (CRV)
 - ◆ Internal band-gap voltage (VBG)
 - ◆ DAC0 output (DAC0_OUT)
- ACMP1 supports
 - 4 multiplexed I/O pins at positive sources:
 - ◆ ACMP1_P0, ACMP1_P1, ACMP1_P2, or ACMP1_P3
 - 4 negative sources:
 - ◆ ACMP1_N
 - ◆ Comparator Reference Voltage (CRV)
 - ◆ Internal band-gap voltage (VBG)
 - ◆ DAC0 output (DAC0_OUT)
- Shares one ACMP interrupt vector for all comparators
- Interrupts generated when compare results change (Interrupt event condition is programmable)
- Supports triggers for break events and cycle-by-cycle control for PWM
- Supports window compare mode and window latch mode

6.28.5 Functional Description

6.28.5.1 Hysteresis Function

The analog comparator provides the hysteresis function to make the comparator to have a stable output transition and it can refer to Figure 6.28-2. If comparator output is 0, it will not be changed to 1 until the positive input voltage exceeds the negative input voltage by a high threshold voltage. Similarly, if comparator output is 1, it will not be changed to 0 until the positive input voltage drops below the negative input voltage by a low threshold voltage.

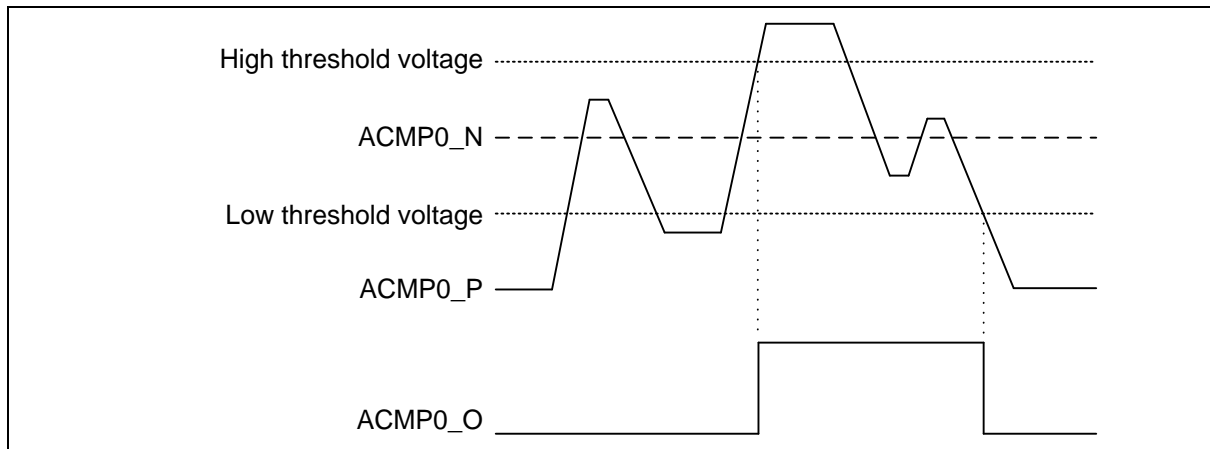

Figure 6.28-2 Comparator Hysteresis Function of ACMP0

6.28.5.2 Window Latch Mode

Figure 6.28-3 shows the comparator operation in window latch mode. Window latch mode can be enabled by setting WLATEN (ACMP_CTL0/1[17]) to 1. When window latch function enabled, ACMP0/1_WLAT pin is used to control the output WLATOUT0/1. When ACMP0/1_WLAT pin is high, ACMP0/1 passes through to WLATOUT0/1. When ACMP0/1_WLAT pin is low, WLATOUT0/1 will keep last state of WLATOUT0/1.

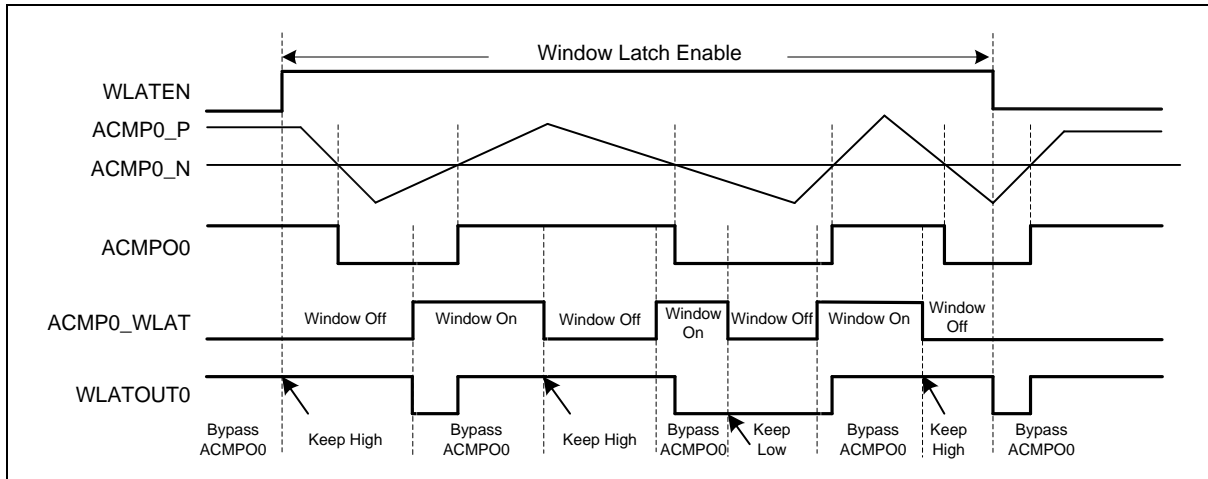

Figure 6.28-3 Window Latch Mode

6.28.5.3 Filter Function

The analog comparator provides filter function to avoid the un-stable state of comparator output.

By setting FILTSEL (ACMP_CTL0[15:13], ACMP_CTL1[15:13]), the comparator output would be sampled by consecutive PCLKs. With longer sample clocks, the comparator output would be more stable. But the sensitivity of comparator output would be reduced.

Figure 6.28-4 shows an example of filter function of ACMPO with FILTSEL = 3 (4 PCLK). In this example, the comparing result is sampled by PCLK. All result must keep for 4 PCLK clocks before it can be output to ACMPO0. If the comparing result is shorter than 4 PCLK, it will be filtered.

Figure 6.28-4 Example of Filter Function

6.28.5.4 Interrupt Sources

The outputs of ACMP0 and ACMP1 are reflected at ACMPO0 (ACMP_STATUS[4]) and ACMPO1 (ACMP_STATUS[5]) respectively. Then they are processed by window latch and filter functions. Finally, the output signal could be utilized to assert interrupts. Refer to Figure 6.28-5, if ACMPIE of ACMP_CTL0/1 register is set to 1, the interrupt will be enabled. If the output state ACMPO0/1 is changed as the setting of INTPOL (ACMP_CTL0/1[9:8]), the comparator interrupt will be asserted and the corresponding flag, ACMPIF0 (ACMP_STATUS[0]) and ACMPIF1 (ACMP_STATUS[1]), will be set to 1. The interrupt flag can be cleared to 0 by writing 1.

If ACMP wake-up function is enabled and system wake-up from power down by ACMP with interrupt enabled (ACMPIE), the WKIF (ACMP_STATUS[8], ACMP_STATUS[9]) will be set, causing interrupt rising.

Figure 6.28-5 shows the interrupts of ACMP is coming from ACMPIF or WKIF and enabled or disabled by ACMPIE.

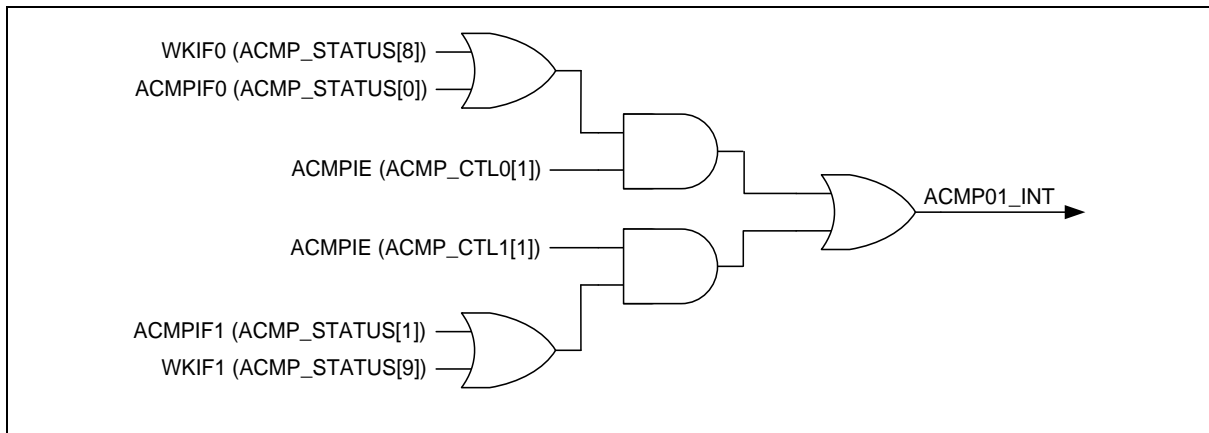

Figure 6.28-5 Comparator Controller Interrupt

6.28.5.5 Comparator Reference Voltage (CRV)

The comparator reference voltage (CRV) module is responsible for generating reference voltage for comparators. The CRV module consists of resistor ladder and analog switch. User can set the CRV output voltage by setting CRVCTL (ACMP_VREF[3:0]). The CRV output voltage can be selected as the negative input of comparator by setting NEGSEL (ACMP_CTL0[5:4], ACMP_CTL1[5:4]). Figure 6.28-6 shows the block diagram of Comparator Reference Voltage.

The resistor ladder will be disabled by hardware to reduce power consumption when NEGSEL (ACMP_CTL0[5:4], ACMP_CTL1[5:4]) is not selected to CRV module. The reference voltage of resistor ladder can be the voltage of AV_{DD} pin or the INT_VREF voltage which is controlled by SYS_VREFCTL register.

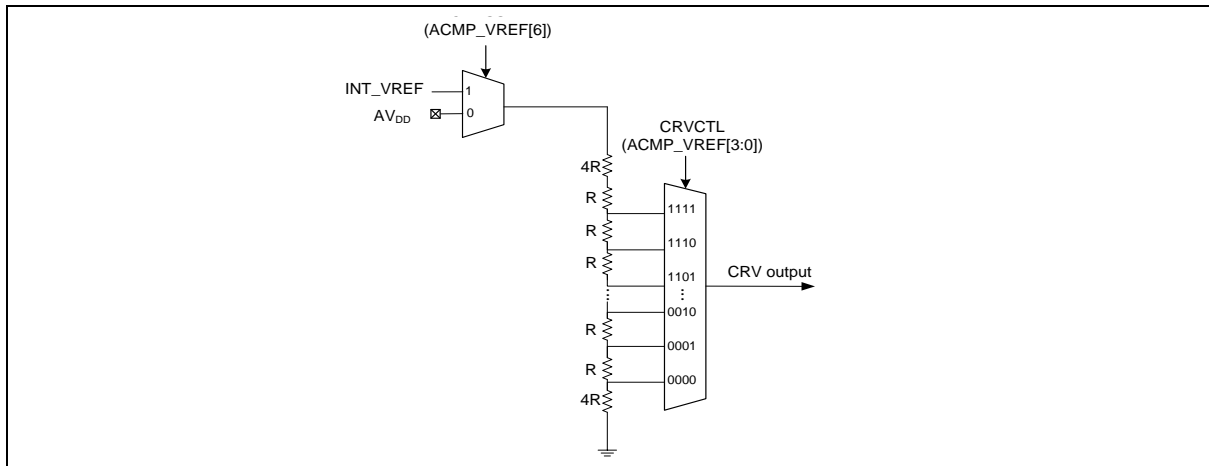

Figure 6.28-6 Comparator Reference Voltage Block Diagram

6.28.5.6 Window Compare Mode

The comparator provides window compare mode. When window compare mode is enabled by setting WCMPSEL (ACMP_CTL0/1[18]) to 1, user can monitor a specific analog voltage source with a designated range. User can connect the specific analog voltage source to either the positive inputs of both comparators or the negative inputs of both comparators. The upper bound and lower bound of the designated range are determined by the voltages applied to the other inputs of both comparators. If the output of a comparator is low and the other comparator outputs high, which means two comparators implies the upper and lower bound. User can directly monitor a specific analog voltage source via

ACMPWO (ACMP_STATUS[16]). If ACMPWO is high, it implies a specific analog voltage source is in the range of upper and lower bound, which are called as the analog voltage is in the window.

Figure 6.28-7 illustrates an example of window compare mode. In this example, once window compare mode is selected, user can choose one of four positive input sources of each comparator and connect these two inputs together outside the chip.

If ACMPS0 outputs high and ACMPS1 outputs low, it means the voltage source is in the range of lower bound and upper bound, which are called as the voltage source in the window. Otherwise, the voltage source is outside the window.

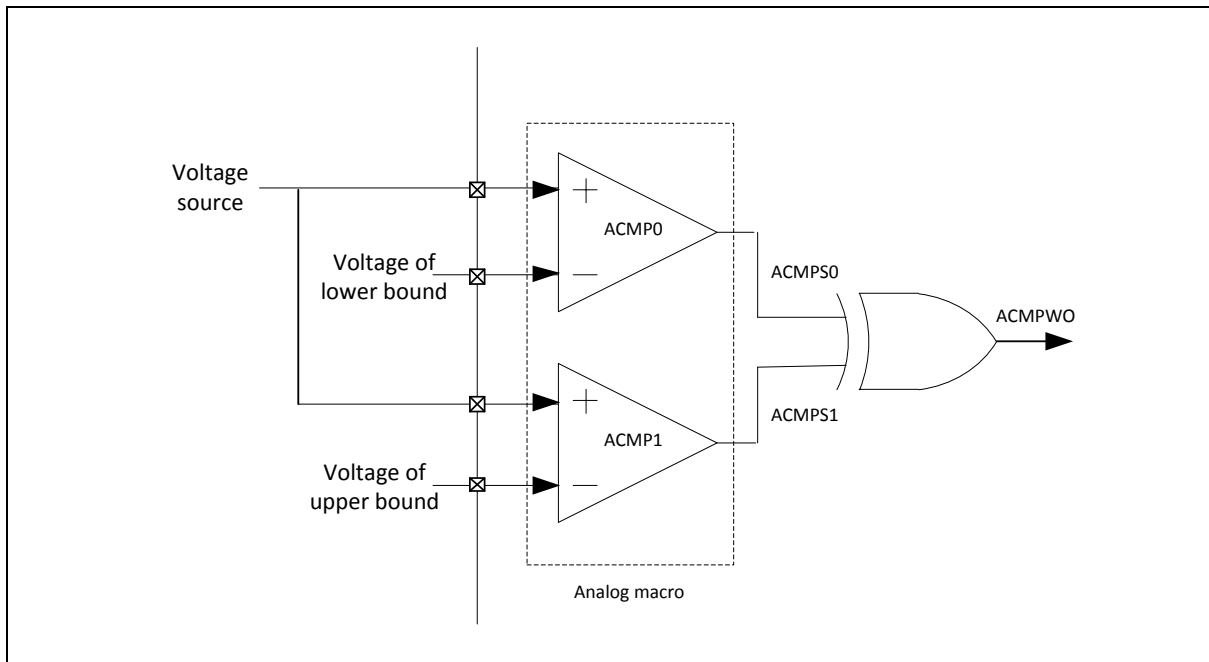

Figure 6.28-7 Example of Window Compare Mode

The comparator window output (ACMPWO) can be shown in ACMP_STATUS[16] and the truth table of window compare logic are shown in Table 6.28-1.

ACMPS0	ACMPS1	ACMPWO
0	0	0
0	1	1
1	1	0
1	0	1

Table 6.28-1 Truth Table of Window Compare Logic

Figure 6.28-8 Example of Window Compare Mode

As shown in Figure 6.28-8, if ACMPWO equals 1, it means positive input voltage is inside the window. Otherwise, the positive input voltage is outside the window. Therefore, ACMPWO can be used to monitor voltage transition of external analog pin. Furthermore, ACMPWO still can be applied to window latch, filter functions and interrupt of ACMP.

Note that negative inputs must choose different source. Otherwise, the function will be meaningless.

6.29 OP Amplifier (OPA)

6.29.1 Overview

This chip is equipped with one operational amplifier. The OP amplifier outputs is connected to ADC channel for measurement requirement. The OP amplifier circuit can also be used in the application of Programmable Gain Amplifier (PGA).

6.29.2 Features

- Analog input voltage range: 0~AV_{DD}.
- Supports up to 1 operational amplifier
- Supports to use schmitt trigger buffer output for simple comparator function.
- Supports schmitt trigger buffer output interrupts.

6.29.3 Block Diagram

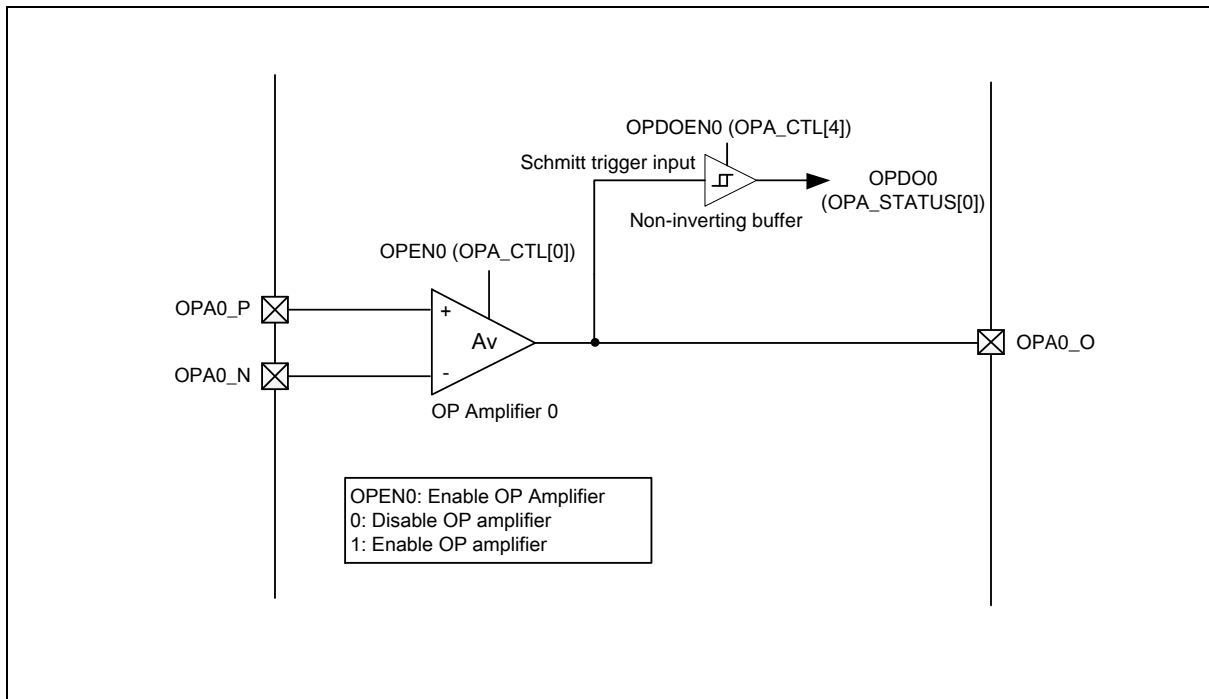

Figure 6.29-1 OP Amplifier Block Diagram

6.29.4.1 OPA0 Basic Configuration

- Clock source Configuration
 - Enable OPA0 peripheral clock in OPACKEN (CLK_APBCLK1[30]).
- Reset Configuration
 - Reset OPA0 controller in OPARST (SYS_IPRST2[30]).
- Pin configuration

Group	Pin Name	GPIO	MFP
-------	----------	------	-----

OPA0	OPA0_N	PB.1	MFP1
	OPA0_O	PB.2	MFP1
	OPA0_P	PB.0	MFP1

6.29.5 Functional Description

6.29.5.1 OP Amplifier Function

The OP amplifier can be enabled by setting OPEN0 (OPA_CTL[0]) bits for OPA0 respectively. The OPA pin functions can refer to Figure 6.29-1 and OPA0 output is also internally connected to ADC channel for measurement requirement. Schmitt trigger buffer enable can be set by setting OPDOEN0 (OPA_CTL[5:4]) bits. OP amplifiers digital output OPDO0 (OPA_STATUS[0]) are set only when the output state of OP amplifiers changes and Schmitt trigger buffer enable bits are set. OP amplifier digital output is always be 0 when the Schmitt trigger buffer is disabled.

6.29.5.2 Calibration Function

The OP amplifier circuit can be used in the application of Programmable Gain Amplifier (PGA), which can amplify signal by 2, 4, 8... The circuit has five trim bits that can be used to calibrate the offset voltage. The offset voltage comes from both mismatch of NMOS-type differential and PMOS-type differential input stages. Calibration can be started by setting CALTRG0 (OPA_CALCTL[0]). After calibration, the input voltage offset can be reduced to be within ±1.6mV(typ). The rail-to-rail common mode input range is achieved by using an NMOS and a PMOS differential pairs connected in parallel. Reading the OPA_CALST register can monitor calibration status, which include calibration done status, NMOS, and PMOS calibration result status. Take a brief calibration flow for example: Once OPEN0 (OPA_CTL[0]) is enabled, hardware will automatically load default calibrated trim values to compensate offset voltage. Therefore, user can directly use OP amplifier without doing additional calibration action. If user wants to start calibration function again, the newer calibrated trim value will be updated after calibration done. Noted that every time OPEN is set, user must set CALTRG0 (OPA_CALCTL[0]) to start calibration function getting newer offset trim values, or the OP amplifier will operate with elder offset trim values.

6.29.5.3 Interrupt Sources

The OPDOIF0 (OPA_STATUS[4]) interrupt flag is set respectively by hardware whenever digital output interrupt enable OPDOIEN0 (OPA_CTL[8]) is set and the OPA0 Schmitt trigger non-inverting buffer output change states. The flag bit is cleared by writing 1 to it. Schmitt trigger buffer outputs of OP amplifier0 can be as one of the comparator interrupt sources.

6.30 Peripherals Interconnection

6.30.1 Overview

Some peripherals have interconnections which allow autonomous communication or synchronous action between peripherals without needing to involve the CPU. Peripherals interact without CPU saves CPU resources, reduces power consumption, operates with no software latency and fast responds.

6.30.2 Peripherals Interconnect Matrix table

Table 6.30-1 Peripherals Interconnect Matrix table

6.30.3 Functional Description

6.30.3.1 From DAC/CRV/BandGap/External Pin to ACMP

Input voltage to ACMP

DAC/CRV/BandGap generate negative input source to ACMP. External Pins include ACMP0/1_P0~3 generate positive input source to ACMP. External Pins include ACMP0/1_N generate negative input source to ACMP.

The detail setting of Comparator positive /Negative Input Selection is described in section 6.28.3.

6.30.3.2 From External Pin to ACMP

Input voltage to ACMP's Window Latch Mode

When window latch function enabled, ACMP0/1_WLAT pin is used to control the output WLATOUT0/1. When ACMP0/1_WLAT pin is high, ACMP0/1 passes through to WLATOUT0/1. When ACMP0/1_WLAT pin is low, WLATOUT0/1 will keep last state of WLATOUT0/1.

The detail setting of Window Latch Mode is described in section 6.28.5.2.

6.30.3.3 From PWM/BPWM to BPWM

BPWM Synchronous Start Function

Select synchronous source from PWM0 or PWM1 or BPWM0 or BPWM1.

To start BPWM and PWM counters in the same time, user has to set the BPWM Synchronous Start Control Register (BPWM_SSCTL[0]) to enable the channel counters which are planned to start counting together, and select the SSRC(BPWM_SSCTL[9:8]) to choose the Synchronous Start source.

The detail setting of PWM synchronous start function is described in section 6.11.5.11.

6.30.3.4 From Timer to BPWM

Timer Generates Trigger Pulses as BPWM External Clock Source

Timer0 ~ Timer3 time-out interrupt signal or capture interrupt signal to trigger BPWM.

When timer counter value matches the timer compared value or when the TMx_EXT pin edge transition meets setting, timer can generate a trigger pulse by setting described in section (連結Timer - Timer Trigger Function).

The setting of BPWM clock source are described in section 6.11.3.

6.30.3.5 From Internal Analog Module/External Pin to DAC Voltage Reference Source

DAC Voltage Reference Source

The DAC reference voltage is shared with EADC reference voltage and it is configured by VREFCTL (SYS_VREFCTL[4:0]) in system manager control registers. The reference voltage for the DAC can be configured from external reference voltage pin (V_{REF}) or internal reference voltage generator (INT_VREF) or analog power pin (AV_{DD}).

The detail DAC voltage reference sources are described in section 6.27.5.2.

6.30.3.6 *From External Pin to DAC*

External Pin Trigger DAC Conversion

The DAC0_ST pin (edge or level detected event to trigger DAC to load new data from DAC_DAT to DATOUT) is used to trigger DAC to start the conversion.

The detail external pin trigger conditions are described in section 6.27.5.6.

6.30.3.7 *From Timer to DAC*

Timer Trigger DAC Conversion

The timer controller provides timer time-out interrupt or capture interrupt to trigger DAC. If TRGSSEL (TIMERx_TRGCTL[0]) is 0, time-out interrupt signal is used to trigger DAC. If TRGSSEL (TIMERx_TRGCTL[0]) is 1, capture interrupt signal is used to trigger DAC.

In Timer mode, TIF interrupt flag (Timer value matches CMPDATx) and CAPIF (Timer capture interrupt flag – rising, falling or both edge detected) are used to trigger DAC to start new conversion.

The detail Timer trigger conditions are described in section 6.27.5.6.

6.30.3.8 *From Internal Analog Module/External Pin to EADC Input Source*

EADC Input Source

EADC input sources comprises external pins EADC_CH0~15, band-gap voltage (VBG), temperature sensor (VTEMP) and Battery power ($V_{BAT}/4$).

The detail EADC input sources are described in section 6.26.2 and 6.26.5.

6.30.3.9 *From Internal Analog Module/External Pin to EADC Voltage Reference Source*

EADC Voltage Reference Source

EADC voltage is referenced from MergePMTOP: internal reference voltage of 2.56V, 2.048V, 3.072V controlled by VREFCTL[4:0] and external pins of V_{REF} and AV_{DD} .

The detail EADC voltage reference sources are described in section 6.26.2.

6.30.3.10 *From External Pin to EADC*

External Pin Trigger EADC Conversion

The EADC0_ST pin (edge detected – rising or falling. Falling edge: 2 PCLK clock high + 3 PCLK clock low. Rising edge: 2 PCLK clock low + 3 PCLK clock high.) is used to trigger EADC to start the conversion.

The detail external pin trigger conditions are described in section 6.26.5.5.

6.30.3.11 *From PWM/BPWM to EADC*

PWM/BPWM Trigger EADC Conversion

The chip provides two PWM/BPWM generators – PWM0/BPWM0 and PWM1/BPWM1. Each PWM/BPWM supports 6 channels of PWM/BPWM output or input capture. There is a 12-bit prescaler to support flexible clock to the 16-bit PWM/BPWM counter with 16-bit comparator. The PWM/BPWM counter supports up, down and up-down counter types. PWM/BPWM uses comparator compared with

counter to generate events. These events use to generate PWM/BPWM pulse, interrupt and trigger signal for EADC to start conversion.

The detail PWM/BPWM trigger conditions are described in section 6.26.5.5 and 6.11.5.16.

6.30.3.12 *From Timer to EADC*

Timer Trigger EADC Conversion

The timer controller provides timer time-out interrupt or capture interrupt to trigger EADC. If TRGSSEL (TIMERx_TRGCTL[0]) is 0, time-out interrupt signal is used to trigger EADC. If TRGSSEL (TIMERx_TRGCTL[0]) is 1, capture interrupt signal is used to trigger EADC.

In Timer mode, the signals CAPIF, TIF are used to trigger the EADC to start the conversion.

In PWM mode, when counter matching zero, period, zero or period, up CMPDAT and down CMPDAT, EADC is triggered to start the conversion.

The detail Timer trigger conditions are described in section 6.7.5.6.

6.30.3.13 *From LXT and USB 1.1 Device to HIRC TRIM*

Use LXT or USB Synchronous Mode to system auto-trim HIRC circuit

This chip supports auto-trim function: the HIRC trim (48 MHz RC oscillator) and MIRC trim (4.032 MHz RC oscillator), according to the accurate LXT (32.768 kHz crystal oscillator) or internal USB synchronous mode, automatically gets accurate output frequency, 0.25 % deviation within all temperature ranges.

The detail of HIRC trim setting is described in section 6.2.8.

6.30.3.14 *From ACMP/Clock/BOD/CPU/PWM/External Pin to PWM*

PWM Brake Event

Each PWM module has two external input brake control signals. User can select active brake pin source is from PWMx_BRAKEy pin by BKxSRC bits of PWM_BNF register(x=0,1, y=0,1). The external signals will be filtered by a 3-bit noise filter. User can enable the noise filter function by BRKxNFEN bits of PWM_BNF register, and noise filter sampling clock can be selected by setting BRKxNFSEL bits of PWM_BNF register to fit different noise properties. Moreover, by setting the BRKxFCNT bits, user can define by how many sampling clock cycles a filter will recognize the effective edge of the brake signal.

The PWM brake event would be triggered by the signals of ACMP_OUT from ACMP, BRAKE of external pin, HXT/LXT clock fail events, BOD event, CPU lockup and software trigger.

The detail PWM brake conditions are described in section 6.12.5.19.

6.30.3.15 *From PWM/BPWM to PWM*

PWM Synchronous Start Function

The synchronous start function can be enabled when SSEN0 (PWM_SSCTL[0]) is set. User can select synchronous source which is from PWM0, PWM1, BPWM0, or BPWM1 by SSRC (PWM_SSCTL[9:8]). The selected PWM or BPWM channels (include channel0 to channel5 of each BPWM or PWM) will start counting at the same time once the synchronous start function is enabled and set CNTSEN (PWM_SSTRG).

The detail PWM brake conditions are described in section 6.12.5.21.

6.30.3.16 *From Timer to PWM*

Cascade Timer or Generate PWM Waveform with Very Low Frequency

PWM can generate waveform with very low frequency by the signals of TIF interrupt flag (Timer value matches CMPDATx) and CAPIF (Timer capture interrupt flag – rising, falling or both edge detected).

PWM Clock frequency can be set equal or double to PCLK frequency. Each PWM generator has three clock source inputs, each clock source can be selected from PWM Clock or four TIMER trigger PWM outputs by ECLKSRC0 (PWM_CLKSRC[2:0]) for PWM_CLK0, ECLKSRC2 (PWM_CLKSRC[10:8]) for PWM_CLK2 and ECLKSRC4 (PWM_CLKSRC[18:16]) for PWM_CLK4.

The detail PWM brake conditions are described in section 6.11.3.

6.30.3.17 *From ACMP and LIRC to Timer Capture Function*

Measure the Time Interval of ACMP0/1 Output Signal or LIRC clock Speed

Sets the timer capture source from ACMP0/1 output signal or LIRC clock and measures the time interval of the signal by using timer capture function. Users can use the results of time interval to trim LIRC through software or to get the ACMP0/1 output pulse width.

The detail of time capture function setting are described in section 6.7.5.4 and 6.7.5.5.

6.30.3.18 *From USB to Timer Event Counting Function*

Event Counting Mode

If ECNTSSEL (TIMERx_EXTCTL[16]) is 1, the event counter source will generate by USB device detect the start-of-frame (SOF) packet.

The detail of event counting mode are described in section 6.7.3 and 6.7.5.3.

6.30.3.19 *From UART/PWM to UART*

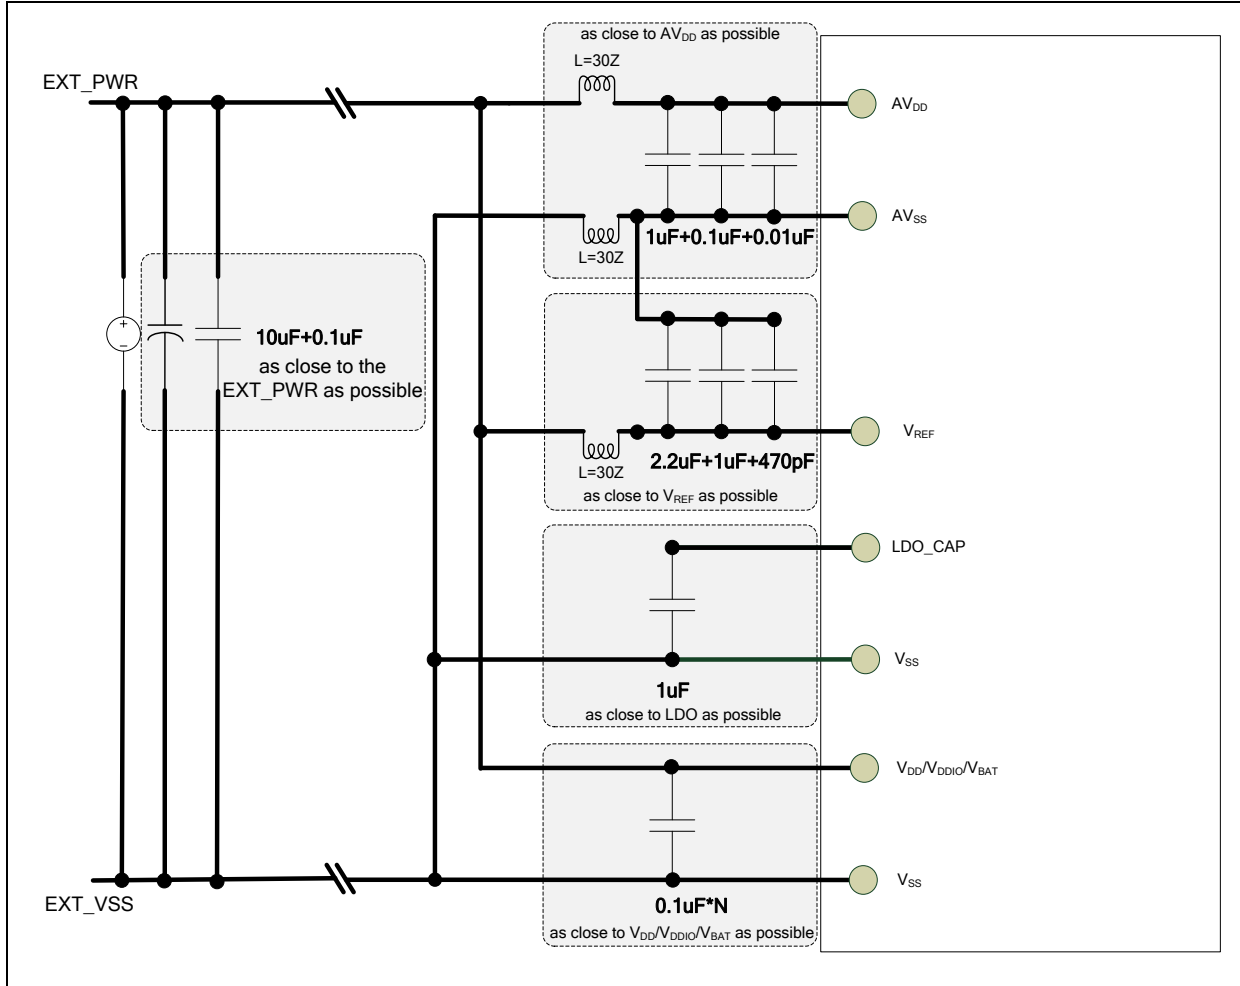

UART0_TXD/USCI0_DAT0 Modulation with PWM

This chip supports UART0_TXD/USCI0_DAT0 to modulate with PWM channel. User can set MODPWMSEL(SYS_MODCTL[7:4]) to select which PWM0 channel to modulate with UART0_TXD/USCI0_DAT0.

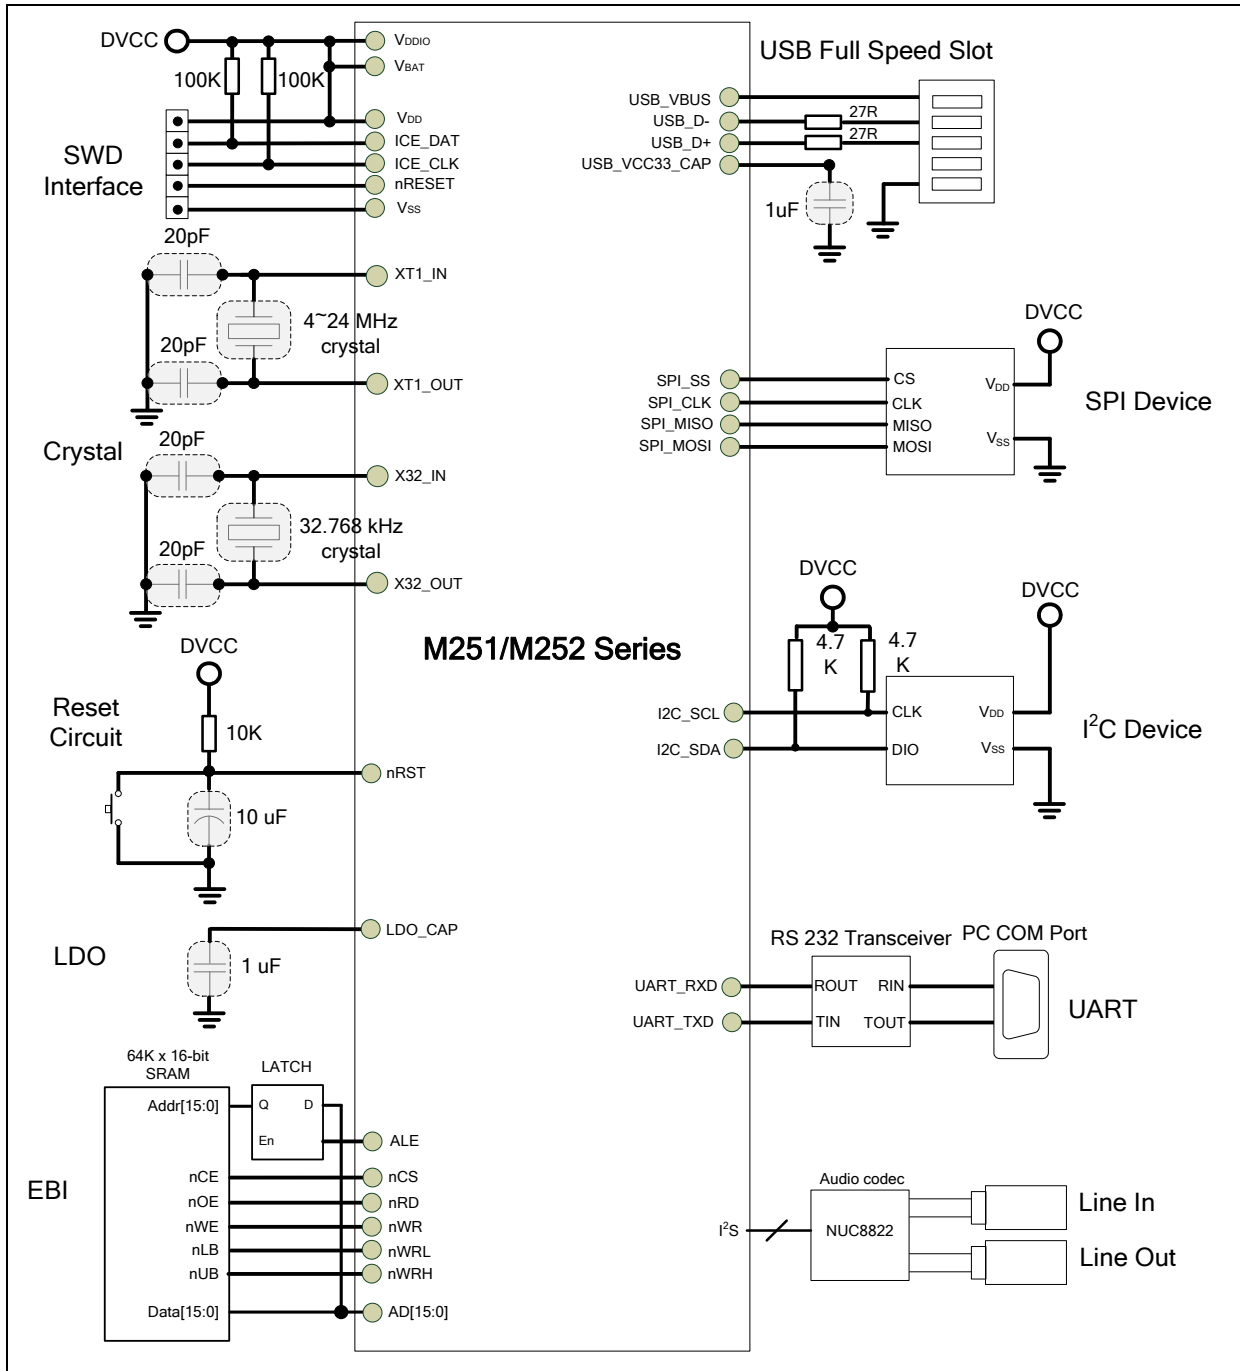

The detail setting of modulation function is described in section 6.2.9.

11 REVISION HISTORY

Date	Revision	Description
2019.12.23	1.00	Initial version.

Important Notice

Nuvoton Products are neither intended nor warranted for usage in systems or equipment, any malfunction or failure of which may cause loss of human life, bodily injury or severe property damage. Such applications are deemed, "Insecure Usage".

Insecure usage includes, but is not limited to: equipment for surgical implementation, atomic energy control instruments, airplane or spaceship instruments, the control or operation of dynamic, brake or safety systems designed for vehicular use, traffic signal instruments, all types of safety devices, and other applications intended to support or sustain life.

All Insecure Usage shall be made at customer's risk, and in the event that third parties lay claims to Nuvoton as a result of customer's Insecure Usage, customer shall indemnify the damages and liabilities thus incurred by Nuvoton.

*Please note that all data and specifications are subject to change without notice.
All the trademarks of products and companies mentioned in this datasheet belong to their respective owners.*
